A NAVAL ENCYCLOPÆDIA:

COMPRISING

A DICTIONARY OF NAUTICAL WORDS AND PHRASES; BIOGRAPHICAL NOTICES, AND RECORDS OF NAVAL OFFICERS;

SPECIAL ARTICLES ON NAVAL ART AND SCIENCE,

WRITTEN EXPRESSLY FOR THIS WORK

BY OFFICERS AND OTHERS OF RECOGNIZED AUTHORITY IN THE BRANCHES TREATED BY THEM.

TOGETHER WITH

DESCRIPTIONS OF THE PRINCIPAL NAVAL STATIONS AND SEAPORTS OF THE WORLD.

COMPLETE IN ONE VOLUME.

PHILADELPHIA:
L. R. HAMERSLY & CO.
1884.

PREFACE.

THE great abundance of encyclopædias that distinguishes our day would, at first sight, seem to discourage any attempt to add to that department of literature. But among all the works coming properly under the name of encyclopædia there is not one, at least in the English language, that supplies the want which it is the aim of this volume to meet. The sea is, so to speak, a world in itself. It has its own vegetable and animal life, and its own natural laws; while on its surface floats a multitude of vessels that serve either as the outlying defenses of the nations which border upon it, or as the carriers of the commodities which they find a profit in exchanging. This world of men and things, so peculiar and distinct, necessarily has a peculiar language, peculiar customs, and peculiar belongings. It is, moreover, a progressive world, and the arts and sciences that have relation to it are moving and developing *pari passu* with those that relate solely to the terrene portion of the globe. When to these considerations is added the fact that the sea is the especial field of operations of a profession which unites in itself the characteristics of the sailor and of the soldier, and to which is committed the high trust of maintaining the honor and dignity of the nation which it represents in all parts of the globe, and of extending over the citizens of its own country, wherever their business or pleasure may call them, the protecting ægis of the national flag, it would certainly appear that sufficient warrant exists for the issuing of this work, which has for its object the bringing together in one view, and within convenient compass, the several kinds of information most useful to naval officers, and most likely to be sought for by seafaring men of every name and grade. Nor is it only those that are by profession, or calling, identified with the sea who will find profit and instruction in this volume. There is a large and increasing class among the gentlemen of our own and other countries who cultivate the sea for the pleasure that it yields, and who take a manly delight in the danger and excitement incident to sporting upon its surface, to whom a book like this must prove an auxiliary of great value. To these may be added, as likely to find advantage in this book, all whose business, or love of knowledge, prompts them to investigate the science of that world which has its habitation in, under, or upon the waters of the great deep.

We have already intimated that this work claims to be unique. It embraces, first, a complete dictionary of marine words and phrases; second, a large number of original articles on special topics; third, a copious fund of biographical data; and, fourth, a gazetteer of the principal naval stations and seaports of the world. No other work uniting these several features exists in our language, nor, we think we may confidently add, in any other.

Custom, no less than justice to those whose labors have produced the volume

now offered to the public, makes it proper to assign to the several collaborators the credit due for their respective shares in its preparation.

To Mr. Lewis R. Hamersly, who saw service with the navy during the war of the Rebellion, and who, as the compiler of "The Records of Living Officers of the Navy," and as the head of the military and naval publishing house of L. R. Hamersly & Co., is well known to the naval profession, credit is due for the conception and plan of the work, and also for the preparation of the general mass of records of officers which it contains.

On Lieutenant J. W. Carlin has devolved the main burden of the editorial conduct of the work. Besides numerous articles in other departments, he has exclusively written or compiled the astronomical articles and definitions, as also the entire mass of nautical definitions not herein specifically credited to others.

Medical Director Edward Shippen, whose biographical sketches of distinguished naval men of our own and former times constitute a feature of the work, has, besides the articles bearing his signature, given it the benefit of his editorial assistance in ways that have contributed largely to improve and perfect it.

Rear-Admiral George Henry Preble, besides the articles which appear over his signature, has contributed the definitions of naval titles, and has greatly assisted the work by his advice and encouragement.

Chief Engineer Albert Aston has contributed the general mass of definitions relating to machinery and steam-engineering, and Passed Assistant Engineer L. W. Robinson has also made valuable contributions to the same department.

To Naval Constructor S. H. Pook belongs the credit of having furnished the definitions of the terms pertaining to ship-building.

Lieutenant E. T. Strong, in addition to the articles signed by him, has contributed the definitions of nautical and naval terms which occur under the letters K, L, and T, respectively.

Lieutenant F. S. Bassett, in addition to the articles which appear over his signature, has compiled, or written, the greater part of the definitions included under the alphabetical headings F, S, W, and X.

In several departments of the work Colonel George A. Woodward, U.S.A., has assisted by contributions and editorial supervision.

The following is a list of the principal works consulted in the preparation of this volume: Smyth's Sailor's Word-book, Falconer's Marine Dictionary, Burn's Naval and Military Technical Dictionary, Cooper's Naval History, Bedford's Sailor's Pocket-book, Luce's Seamanship, Nares's Seamanship, Totten's Naval Text-book, Dana's Seaman's Friend, Harbord's Glossary of Navigation, Bowditch's Navigator, Loomis's Astronomy, Peabody's Astronomy, Proctor's Hand-book of the Stars, Cooke's Naval Gunnery, Ordnance Instructions (1880), Lippincott's Gazetteer, Wilson's Ship-building, Very's Navies of the World, King's War-ships and Navies of the World, Knight's Mechanical Dictionary, Sleeman's Torpedoes and Torpedo Warfare (*Electricity*), Myer's Manual of Signals, Navy Regulations, Webster's Dictionary, Worcester's Dictionary, Brande's Encyclopædia, Chambers's Encyclopædia, Appleton's Encyclopædia, Johnson's Encyclopædia, Kent's Commentaries, Sharswood's Blackstone.

- Examination of Officers for Promotion and Retirement in the Navy, Board of.

THE following is a summary of the contents of the book:

I. A complete Dictionary of Nautical Terms and Phrases.

II. Biographical Notices of Distinguished Naval Officers of our own and foreign services.

III. Special Articles prepared expressly for this work by officers and others of recognized ability in their respective fields of discussion, and comprehending the freshest and most authentic information attainable respecting the several subjects treated.

IV. A Gazetteer of the Principal Naval Stations and Seaports of the World.

V. A Supplement containing concise Records of Living Officers of the Navy, including Captains, Commanders, Lieutenant-Commanders and Lieutenants, and Staff-Officers of relative rank. The records of Flag-Officers are included in the body of the work.

A NAVAL ENCYCLOPÆDIA.

A.

A. Abbreviation for *after* in the U. S. General Service Code of Signals. Contraction for *at*, *on*, or *in*, as, *a-stern*, *a-shore*, *a-poise*.

A 1. The highest class of excellence in merchant vessels. See CLASSIFICATION OF MERCHANT VESSELS.

Aalborg. A city and seaport of Denmark, in Jutland, on the south shore of the Lymfiord, near its mouth, in the Cattegat. Lat. 57° 2′ 46″ N.; lon. 9° 55′ 38″ E. Pop. 11,721.

Aarhuus. A seaport of Denmark, in Jutland, on the Cattegat, at the mouth of the Molle-Aue, 37 miles S.E. of Viborg. Lat. 56° 9′ 27″ N.; lon. 10° 12′ 46″ E. Pop. 15,000.

A. B. An abbreviation signifying *Able Seaman*. See ABLE.

Abab. A Turkish sailor who plies in coasting craft.

Aback. The situation of a sail when the wind acts on its forward surface. The sails are *laid aback*, or *thrown aback*, by hauling in the weather-braces or by putting the helm down, or both. They are *caught aback*, or *taken aback*, by a shift of wind, or by inattention at the helm. *Flat aback* means that the wind acts nearly at a right angle to the forward surface of the sail. *Taken aback* is also used figuratively for being taken by surprise. *All aback forward* is the notice from the forecastle that the head-sails have been taken aback. *Brace aback* is the order given to swing the yards and lay the sails aback.

Abaft. Behind. *Abaft the beam*, astern of a line forming a right angle with the keel.

Abaka. The fibre of which Manilla rope is made.

Abandon. To relinquish to underwriters all claim to property which may be recovered from shipwreck, capture, or any other peril stated in the policy. To desert a vessel on account of the danger in remaining on board.

Abatement. A demand for a reduction of freight when unforeseen causes have delayed or hindered the performance of a stipulated charter-party.

Abeam. Opposite the centre of the ship's side; on a line which forms a right angle with the keel.

Aberration. The apparent displacement of the stars, caused by the motion of the earth combined with the motion of light. The deviation of the rays of light from the principal focus of a lens.

Abet. To excite, encourage, or assist.

Able. Competent; strong. *Able Seaman*, a rating on the ship's books. He must be competent to perform all the duties required of a sailor.

Able-whackets. A sea game, in which the loser is beaten over the hands with a handkerchief, tightly twisted.

Aboard. On board; inside, or upon a ship. Residing afloat. *To keep the land aboard* is to hug the shore. *To fall aboard of* is for one vessel to foul another. *To lay an enemy aboard* is to run into or alongside of him. *To haul the tacks aboard* is to set the courses.

About. *To go about* is to change the course of a ship by tacking. *Ready about*, or *'boutship*, is the order to prepare for tacking.

Abox. The position of the head-yards when they are braced aback, the after-sails remaining full. *Brace-abox*, the order to lay the head-yards abox. This is done in boxhauling and occasionally in heaving-to, but is more generally done to box the ship's head off from the wind after she has been caught aback, or after she has missed stays.

Abraham-men. An English cant term for vagabonds who, under pretence of being destitute mariners, beg about the dock. A malingerer wanting to go on the sick-list is said to "sham Abraham."

Abrase. To dub or smooth planks.

Abreast. Side by side; opposite to; parallel with. *Line abreast*, a formation in which the ships are abeam of each other.

Abri. (*Fr.*) Cove; shelter; under the lee; a safe anchorage on a weather shore.

Abrid. A pintle-plate.

Abroach. On tap; in use.

Abroad. On a foreign station; in a foreign country. An old word for *spread;* as, all sail *abroad*.

Abrupt. Steep; broken; craggy; as, of cliffs and headlands.

Absence. State of being absent. *Leave of absence*, permission of the proper authority to be absent from post or duty for a specified time. *Absence without leave*, with manifest intention not to return, is *desertion*. When there is a probability that the party intends to return, he

is to be considered a *straggler* for ten days, at the expiration of which he is to be regarded as a *deserter*.

Absorption. A term formerly used for the sinking of islands and tracts of land Subsidence.

Abstract. An abridgment of the contents of a book or document.

A-burton. The situation of casks when stowed athwartships.

Abut. When two planks are joined endwise they are said to *butt* or *abut* against each other. *Abutting-joint* is a joint where the pieces come together at a right angle.

Abutment. The breech-block of a fire-arm.

Abyme. The site of constant whirlpools, as the Maëlstrom was supposed to be. An abyss.

Abyss. A depth without bottom.

Academies, Naval. The United States Naval Academy at Annapolis was founded and formally opened on October 10, 1845. On August 7, 1845, Mr. George Bancroft, Secretary of the Navy under President James K. Polk, issued instructions to Commander Buchanan for the opening of the school. The War Department had previously transferred to the naval authorities the site and buildings of Fort Severn, one of the defenses of Annapolis harbor, at the mouth of the Severn River, in the State of Maryland. The first step was to collect the midshipmen, who, from time to time, were on shore, and give them occupation in the study of subjects essential to the education of a naval officer. In October, 1849, a board of officers was convened to reorganize the institution, and to make it conform, as nearly as possible, to the system pursued at the Military Academy at West Point. The course of instruction and the regulations were revised, and the title of the institution was changed from Naval School to U. S. Naval Academy. In November, 1851, the course of study was fixed at four years. A practice-vessel was attached to the Academy for summer cruising, and a Board of Visitors was provided for, to attend the annual examinations, and to report upon the condition of the school. After the breaking out of the civil war, in May, 1861, the Academy, with all its apparatus and *personnel*, was transferred to Newport, R. I., where it remained until September, 1865, when it was returned to Annapolis. The programme of studies was then rearranged to conform more closely to modern ideas, and remains practically unaltered at this date. The course of instruction embraces the following studies, viz.: seamanship, which includes naval construction, naval tactics, practical exercises, signals, swimming, gymnastics, etc.; ordnance and gunnery, which includes infantry tactics, field-artillery and boat-howitzer exercise, great guns, mortar practice, and fencing; mathematics, which comprises algebra, geometry, trigonometry, analytical geometry, descriptive geometry, and calculus; steam engineering, comprising practical exercises, theory of steam-engine, and fabrication and designing of machinery; astronomy, navigation, and surveying; physics and chemistry; mechanics and applied mathematics, which includes, besides mechanics, the differential and integral calculus, and theoretical naval architecture; English studies, history and law; modern languages, French and Spanish; drawing, comprising right-line, free-hand and perspective, topographical, and chart making. On June 1, 1880, the *personnel* of the Academy was as follows: commanding officer and staff, including medical and pay officers and chaplain, 12; instructors, 46 commissioned officers and 15 civilians, 61; civil officers, including secretary, librarian, clerks, etc., 14; marine officers, 3; warrant-officers, 2; and 7 mates attached to the gunnery-ship and practice-vessels; total staff of the Academy, 99; number of cadet midshipmen, 253; of cadet engineers, 99; total of students, 352; aggregate, 451. The list of successive superintendents is as follows: 1st, Commander Franklin Buchanan, 1845–47; 2d, Commander George P. Upshur, 1847–50; 3d, Captain C. K. Stribling, 1850–53; 4th, Captain L. M. Goldsborough, 1853–57; 5th, Commodore George S. Blake, 1857–65; 6th, Vice-Admiral D. D. Porter, 1865–69; 7th, Rear-Admiral John L. Worden, 1869–74; 8th, Rear-Admiral C. R. P. Rodgers, 1874–78; 9th, Commodore Foxhall A. Parker, 1878–79. In June, 1879, Commodore Parker died, and was succeeded by Rear-Admiral George B. Balch as the tenth superintendent. In 1865 two classes of cadet engineers, not to exceed 50 in the aggregate, were admitted into the Academy. The duration of their course was, until June 1, 1873, two years. By act of Congress, approved February 24, 1874, their course was lengthened to four years, and the number of classes increased to four. The examinations of candidates for cadet engineers are competitive. Candidates must be between 16 and 20 years of age, and of sound body. The number of appointments that can be made is limited by law to 25 each year. The academic examination previous to appointment is on the following subjects, namely: arithmetic, algebra, through equations of the first degree, plane geometry, natural philosophy, reading, writing, spelling, grammar, composition, geography, free-hand drawing, and the elementary principles governing the action of the steam-engine. Candidates who possess the best knowledge of machinery, other qualifications being equal, have precedence for admission. The pay of cadet engineers while at the Academy is $500 per annum. After the academic course, two years' sea-service is required before being eligible to be commissioned as assistant engineers, and then only as vacancies occur. The studies of cadet engineers at the Academy consist of mathematics, analytical mechanics, theory and practice of steam engineering, physics and chemistry, French and Spanish, drawing, designing of machinery, naval architecture, and practice in the workshops. On March 3, 1873, Congress passed a law changing the duration of the course for cadet midshipmen from four to six years, to apply to the class admitted in 1873 and to all subsequent classes. Four years of the six are passed in completing the academic course, the remaining two years are passed at sea on board a regular cruising-vessel, after which they return to the Academy and are required to pass the following final graduating examination: physical, ordnance, naval tactics, navigation, French and Spanish, seamanship, and steam. The marks of this examination, combined with those of the academic course, determine the graduating number; and passing successfully, the *cadet midshipman* becomes a *midshipman*, and he is then eligible to be commissioned an ensign when va-

cancies occur. The number of cadet midshipmen allowed at the Academy is one for every member and delegate of the House of Representatives, ten at large, and one from the District of Columbia, appointed by the President. The nomination of a candidate from any Congressional district or territory is made on the recommendation of the member or delegate from actual residents of his district or territory. Candidates must be of sound body, between 14 and 18 years of age, and present themselves to the superintendent of the Academy for examination for admission in June and September. The examination in reading is of course conducted orally, all other examinations are in writing. A satisfactory examination must be passed in arithmetic, geography, grammar, writing, and spelling. Candidates who pass the physical and mental examinations will be appointed as cadet midshipmen and become inmates of the Academy. Each cadet is required to sign articles by which he binds himself to serve in the navy eight years, including the time at the Academy, unless sooner discharged. The pay of a cadet midshipman is $500 a year, commencing at the date of his admission. The academic year begins October 1, and ends May 30. The year is divided into two academic terms, the first term extending from October 1 to January 30. Each of the classes is divided into a convenient number of sections of from nine to twelve members, and the recitation hours into three periods of two hours each, and no student is required to attend more than three recitations during the day; so that besides the evening study hours, one hour of each period may be devoted to study. The system of examination comprises monthly, semiannual, and annual examinations, all of which are conducted in writing, the same questions being proposed to each member of a class. If the cadet fail to pass the semi-annual or annual examination he is dropped. The monthly examination-marks are combined with the daily marks to determine the monthly standing. These marks are combined with those of the semiannual examination to find the term standing, which latter are again combined to form the annual record. The summer months are employed in cruising at sea. The sailing-vessels "Santee," "Constellation," and "Dale," the ironclad monitor "Nantucket," and the steamers "Mayflower" and "Standish" are permanently stationed at the Academy during the two academic terms for the purpose of instruction in great guns, and in sails, spars, steam, etc. The "Constellation" is commissioned for the summer cruise of the first and third classes of cadet midshipmen. The second class is granted leave during the summer, and the fourth class, admitted in June, is quartered on board the "Santee" for practical instruction until the beginning of the academic year. The first and third classes of cadet engineers are embarked on board the practice-steamers, and visit the United States navy-yards and private ship-yards, particularly those where iron ship-building is done, foundries, rolling-mills, machine-shops, etc. They are required to take notes and make sketches of machinery, etc., at every place visited. The second class of cadet engineers goes on leave. The officers for all the practice-vessels are detailed from the officers attached to the Academy. The academic grounds inside the walls consist of 50 acres. The grounds outside consist of 109 acres. Aggregate, 159 acres. The departments of study and the observatory are amply supplied with models and apparatus. The library contains 20,000 volumes, chiefly historical, scientific, and professional. At the International Exhibition held at Paris, France, in 1878, the United States Naval Academy received a diploma of the value of a gold medal, which was one of the four diplomas awarded to educational institutions in the United States for the best quality of education in the group classed as superior.

England.—The Royal Naval Academy was first established at Portsmouth dock-yard by order from the admiralty dated March 13, 1729, the age of admission being between 13 and 16 years. The young gentlemen entered the naval service either by nomination from the admiralty through the Royal Naval Academy, or by direct nomination to sea-going ships by flag-officers and captains of ships in commission. In 1806 the title of the establishment was changed to Royal Naval College. In 1816 the college was united to the School of Naval Architecture, and the age of admission fixed at from 12½ to 14 years. In 1821 the age was again altered, from 12½ to 13½ years, and so continued until the college was closed, in 1837. The number of cadets allowed after 1806 was 70, mainly selected from the nobility and gentry. The college was closed owing to the old method of appointing midshipmen directly into the navy without any conditions of previous preparation existing at the same time, which, being short and easy, was commonly preferred. After passing an easy entrance examination, the course of instruction at the college was not much more than elementary, and extended over a period of two years. After a year's sea-service the student was eligible to be rated as midshipman. In the year 1839 the Royal Naval College was reopened for the purpose of establishing further means of scientific education for a certain number of commissioned officers, who were allowed to remain at the college for one year. In the beginning of 1857—the experience of twenty years since the abolition of the old naval college as a seminary for boys having meanwhile fully demonstrated the necessity for some kind of preliminary training for cadets on their first entry into the service—the admiralty established a new system of instruction on board a training-ship, to which the cadets were to be appointed after passing into the service by a moderate test examination, with some modification of detail on certain points. The system of educational training established in 1857 still continues in force. In 1868 a sea-going ship was established supplementary to the stationary one. Under the regulations at present in force the candidate must not be under 12 nor above 13 years of age. The principle of limited competition has also been introduced. Candidates must pass a strict physical examination, and afterwards undergo a preliminary test examination in reading, writing, dictation, French, arithmetic as far as vulgar and decimal fractions, and Scripture history. Those who successfully pass this examination are allowed to compete in a further examination in arithmetic, algebra to simple equations, Book I. of Euclid, French, Latin, English history, geography, German, Italian or Spanish, and

drawing,—the candidates selecting not more than three of these subjects, or four, if drawing be one. Successful competitors are then appointed to the "Britannia," at Dartmouth, as naval cadets. The course of instruction there lasts two years, and is supplemented by a year's further training on board a special sea-going training-ship. On leaving the "Britannia" the cadets are classed according to their merits in study and conduct. Cadets having obtained one year's sea-time on leaving the training-ship, are rated as midshipmen. During the three years on board the training-ships the cadets study the following subjects: mathematics, consisting of a partial course in arithmetic, algebra, geometry, and trigonometry, with a short course in steam, elementary surveying, English, French, geography, history, and drawing. After completing five years' service, including the time on board the training-ships, and having attained the age of 19 years, they are eligible to pass for lieutenant. The Royal Naval College at Greenwich was reorganized and opened February 1, 1874, for the instruction of officers of all branches of the naval service, including captains and excluding midshipmen.

France.—Students are admitted to the Naval School on board the "Borda," at Brest, once in each year, by competitive examination. Candidates of respectable parentage are eligible for admission, provided they are native Frenchmen or have been naturalized, and are not less than 14 or more than 17 years of age on the 1st of January of the year in which they compete. Their parents are obliged to pay the equivalent of $140 a year to support them while at the school. The examinations are held in July at Paris and at seven other large cities in France, and in Corsica and Algiers. The examination, partly written and partly oral, is on the following subjects: written—French and English composition; numerical calculation of plane trigonometry, and descriptive geometry; oral—French and English, general history, geography, arithmetic, algebra, geometry, trigonometry, and descriptive geometry. To these is added drawing from nature. If the candidate pass the oral examination, he undergoes a further examination, more searching in the same subjects, for competition. A committee in Paris selects the prescribed number of candidates in order of merit. Those selected join the training-ship "Borda" on October 1, and remain there two years. The subjects of instruction are literary, scientific, and professional. An examination is held at the end of each year, and those that fail to pass in either branch of instruction are dismissed. At the end of two years those who pass successfully are sent on board the cruising-ship "Jean Bart," where the course is strictly practical. The cruise lasts about one year, and on their return an examination is held in the following subjects: naval architecture, steam, seamanship, naval gunnery, infantry tactics, navigation and surveying, naval regulations, literature, English, drawing, naval book-keeping, international and maritime law, and naval hygiene, which finishes the course. There are also a certain number of students who pass directly from the Polytechnique School into the "Jean Bart," and during their subsequent service they are in no way distinguished from those who have been trained in the "Borda." The "Jean Bart" also receives a few students from the corps of naval constructors, and takes them to sea.

Germany.—The officers' corps of the Imperial navy is made up from young men that enter the service as cadets, and from sailors that are granted such a chance for advancement. Applications for admission as cadet must be made to the admiralty at Berlin during the months of August and September of the year preceding the examination for admission. The application must be accompanied by a number of papers giving a detailed account of the candidate's family, his intellectual training and physical condition. The examination is held every year, in the month of April, before an examining board at Kiel, appointed by the chief of the admiralty. The candidate must first pass a physical examination, and not be more than 17 years of age, except a graduate of a high school, who must not be more than 19 years of age. The examination for admission is in the following subjects: Latin, grammar, arithmetic, geometry, trigonometry, elements of physics, geography, history, French and English, and free-hand drawing. If the candidate has a certificate of graduation from a high school, or a school of equal rank, he is freed from an examination if his record in mathematics be good; if not, he must pass an examination in that branch. The results of this examination are sent to the chief of admiralty, who decides which ones shall be admitted. The cadets must pay their own expenses. The cadets selected for admission are embarked on board a practice-ship. They cruise during the summer and return to the station in September. Those cadets that show a want of aptitude for the service are then dismissed by order of the admiralty. The remaining cadets receive certificates signed by the commanding officer and other officers of the practice ship, and are ordered to attend the cadets' class of the naval school after taking the oath of allegiance. The instruction in the cadets' class is intended to prepare the cadets for the *Naval Cadets'* examination, and lasts about six months. This examination embraces the following subjects: navigation, seamanship, artillery, infantry tactics, arithmetic, trigonometry, geometry, chemistry, official reports, topography, English and French. Those failing to pass are either turned back or dismissed. Those cadets that have passed are embarked on board a practice-ship, and sent on a cruise for two years. During that time they receive practical training, and are also instructed in those branches of science more strictly professional. At the end of the cruise, those receiving a satisfactory report from the commander of a vessel are ordered to attend the first officers' examination at Kiel in the following subjects: navigation, seamanship, naval tactics, artillery, marine engines, naval architecture, knowledge of the duties of officers, French and English. Those that pass the examination are appointed second lieutenants without commissions, and are made to attend the officers' class of the Naval Academy. The course of instruction commences in October and closes the following August, and is intended to complete the theoretical education, and prepare the members for the second officers' examination, which takes place each year, in September, at Kiel, and in the following subjects: navigation, infantry tactics, artillery, naval architecture, marine engines, fortification,

drawing, geometry, trigonometry, mechanics, and physics. Full reports of the examination are submitted to the admiralty, the relative standing of those that have passed finally determined, and commissions as second lieutenant are issued. Sailors are admitted on the recommendation of their superior officers after a service of at least twelve months on board a man-of-war, and must not be over 20 years of age. The regulations for admission and examinations are the same for sailors as for those persons entering from civil life.

ITALY.—The candidates enter at Naples on the 15th of June in each year; they must be of sound body, not less than 13 nor over 17 years of age, and must give security that their expenses will be paid. The examination for admission is competitive, and is in arithmetic, elementary algebra, geometry, ancient history, grammar, French, and geography. The Royal Naval School is composed of two divisions,—the first at Naples, and the second at Genoa. The course at Naples is two years, and comprises the following subjects: algebra, geometry, trigonometry, descriptive geometry, navigation, French and English, drawing, calculus, physics, descriptive and political geography, and Italian literature. The last two years of the course are passed at Genoa, and the following subjects taught: mechanics, astronomy, hydrography, history, political geography, Italian literature, French and English, theory of ships, naval construction, naval tactics, fortification, artillery and infantry tactics, torpedoes, and practical exercises, including fencing, gymnastics, swimming, and dancing. The practice-cruises are made each year from June to November, and the examinations take place before the cruise begins. Those who graduate are recommended for nomination to the grade of midshipmen, and go directly into active service.

RUSSIA.—Those who are desirous of entering the naval service must pass into the Naval School at St. Petersburg. Candidates eligible for admission must be sons of hereditary noblemen, of superior civil or military officers, or of hereditary honorable citizens. The age of candidates must not be under 15 nor over 18 years. Those candidates who may wish it are allowed, before entering the school, to go through a trial-cruise to test their aptitude for the service. If the trial-cruise be satisfactory the candidate must pass a physical and mental examination. The examination is held yearly, in the month of September, embracing the following subjects: religion, grammar, geography, history, arithmetic, algebra, geometry, and French. The course of instruction lasts four years, at the expense of the government. At the end of four years the students are examined in the subjects mentioned as follows: religion, navigation and pilotage, astronomy, seamanship, naval history, naval tactics, gunnery, surveying, steam, theoretical and practical naval architecture, fortification, jurisprudence, and Russian and French languages. Having passed this examination the student is made a naval cadet, and is embarked on board a training-ship to cruise for two years, at the end of which he is subjected to a final examination in practical seamanship.

SPAIN.—The Naval College for midshipmen was created by royal decree, September 18, 1844, in order that young men who desire to become naval officers may learn, theoretically and practically, their profession. It is situated in San Carlos, department of Cadiz. The *personnel* is composed of, besides the commanding officer and staff, 11 professors of mathematics, 1 of physics, and 10 for drawing, seamanship, ship-building, English and French, fencing, gymnastics, and dancing, 2 chaplains, and 8 lieutenants, who, besides their duties as officers, give military instruction to the cadets. By a royal decree of February 20, 1864, only 60 can enter yearly. The candidate must be between 13 and 16 years of age. All the vacancies, except four, are filled by competitive examination in the following subjects: religion, reading, writing, grammar, arithmetic, algebra, geometry, French and English, geography, and drawing. By the last-mentioned decree the time in the college has been reduced from two and a half years to one year and a half, and the students study the following subjects: trigonometry, geometrical analysis, astronomy, navigation, physics, meteorology, chemistry, gunnery, French and English, naval tactics, infantry tactics, seamanship, geography, history (sacred, profane, and naval), religion and morals, drawing, fencing, gymnastics, swimming, and dancing.—*F. W. Dickins, Lieutenant-Commander U.S.N.*

Academite. A graduate of the Royal Naval Academy at Portsmouth, England.

Acair-phuill. A safe anchorage.

Acalephæ. A class of marine animals of low organization, having a translucent jelly-like structure, and frequently possessing the property of stinging; as, the Portuguese man-of-war (*Physalia*), and the common jelly-fish (*Medusa*).

Acapulco. A seaport of Mexico, on the Pacific. Lat. 16° 50′ N.; lon. 99° 48′ W. It has a magnificent landlocked harbor, and is 302 miles S.S.W. of Mexico. Pop. 5000.

Acast. An old word for *lost* or *cast away.* Abox; as, the head-yards were said to be braced *acast.*

Acater. Purveyor of victuals, whence *caterer.*

Acatium. A word used by the Romans for a small boat, and also for the mainmast of a ship.

Acceleration. The increase of velocity in a moving body. A planet is said to be accelerated when its actual diurnal motion exceeds its mean. In the fixed stars this acceleration is the mean time by which they anticipate the sun's diurnal motion. Acceleration of the moon is the increase of her mean motion, caused by a slow change in the eccentricity of the terrestrial orbit.

Access. Means of entry or approach. *Accessible,* approachable by land or sea.

Acclivity. The upward slope of an inclined cliff.

Accoil. To coil together.

Accommodations. Fittings, conveniences. *Accommodation ladder,* a convenient flight of steps shipped at the gangway. When shipped on both sides, the starboard ladder is reserved for the use of commissioned officers and their visitors.

Accompany. To sail together; to convoy.

Accon. (*Fr.*) A flat-bottomed Mediterranean boat for carrying cargoes over shoals.

Accost. To hail; to pass within hail; to sail coastwise; to draw near.

Account. *Going upon account*, a phrase for buccaneering.

Accounts. The several books and registers of money, stores, clothing, and provisions. See PAYMASTER.

Accouplement. A timber tie or brace.

Accoutrements. Equipments of soldiers and marines.

Accul. An old term for the end of a deep bay; from *cul-de-sac*.

Accuse. To charge with an offense.

Accused. The designation of the party on trial before a court-martial. See COURT-MARTIAL.

Achernar. *α Eridani*, a star of the first magnitude in the constellation Eridanus, called by navigators the "Spring of the River."

Achromatic. A term applied to optical instruments in which aberration and the colors dependent thereon are partially corrected. *Achromatic condenser*, a lens used to concentrate the rays of light on an object in a microscope.

Achronical. An old term signifying the rising of a heavenly body at sunset, or its setting at sunrise.

Acker. An eddying ripple on the surface of flooded waters. A tide swelling above another tide. See EAGRE, BORE.

Ackmen, or Ack-pirates. Fresh-water thieves.

A-cockbill. A yard is *a-cockbill* when by accident or design one yard-arm is topped up more than the other. (See MOURNING.) The anchor is *a-cockbill* when it hangs from the cat-head by the ring-stopper ready for letting go. In the navy the anchor is not cockbilled except in special cases.

Acolyte. The smaller component of a double star.

Acorn. A cone-shaped piece of wood attached to the vane.

Acoustics. The science of sound. The *acoustic telegraph* is one which makes audible instead of visible signals

Acquit. To discharge from an accusation; to free or exonerate from blame or suspicion; to clear from imputation. The word is also used to express personal bearing; as, to acquit one's self well.

Acquittance. A release or discharge in writing for a sum of money, or duty, which ought to be paid, or done, on the ship's account.

Acre. A city and seaport of Syria, on a promontory at the foot of Mt. Carmel. Lat. 32° 55′ N.; lon. 35° 5′ E. Pop. 4800. The Bay of Acre is much frequented by French, Italian, and Austrian vessels.

Acrostolium. A symbolical ornament on the prows of ancient vessels; the origin of the modern figure-head.

Act. Deed, performance, edict, decree, or law. *Overt act*, an open act done in pursuance of a criminal design,—the mere design not being punishable without such act. *Act of God* comprehends all accidents arising from physical causes. *Act of Court*, the decision of the judge on the verdict or on a point of law. *Act and Intention* must be united, in admiralty law.

Acting. A prefix to denote that a rank is held temporarily.

Action. Exertion of power or force. *Double action* denotes that the motor acts positively in producing the backward and forward movement. An engagement; a battle. *Clear ship for action*, to prepare for battle by removing everything that obstructs the working of the battery or hinders the handling of the ship; by removing all fixtures and appliances, not needed for action, but which might cause the enemy's shot to create havoc and confusion; by removing articles liable to injury by exposure; and by providing articles necessary to the security of rigging and spars.

Active. Requiring or implying action or exertion; practical; operative.

ACTIVE LIST. The list of officers liable to be called upon for active duty, in contradistinction to the Retired List (which see).

ACTIVE SERVICE. Duty before the enemy, or operations in his presence. Any duty under the orders of the Navy Department.

Actuaire. (*Fr.*) An open transport propelled by oars and sails.

Actuairole. (*Fr.*) A small galley propelled by oars.

Acumba. Oakum; the *hards* or coarse parts of flax and unplucked wool.

Acuña, Christopher. Jesuit and explorer, b. Burgos, 1597, d. Lima about 1675. He was one of the early explorers of the river Amazon, and was sent to report the incidents of the expedition of 1639. On his return to Spain he published at Madrid, in 1641, "Nuevo Descubrimiento del gran Rio de las Amazonas." He subsequently went to the East Indies, returned to South America, and died on the way from Panama to Lima.

Adamant. The loadstone; the magnet:—the sense in which it was held by early voyagers.

Adapter. A ring or tube to adapt or fit any accessory apparatus to an instrument.

Addel, or Addle. The putrid water in casks.

Addice. An adze. The addled eggs of sea-fowl.

Addlings. Accumulated pay.

Address. Bearing. To consign or intrust to another as an agent.

Adelaide, Port, six miles from the capital of South Australia. Lat. 34° 49′ S.; lon. 138° 38′ E. It is a free port, and accessible for vessels drawing 18 feet of water.

Adit. An air-hole or drift. The aperture by which a mine is dug and charged. The aperture by which a ship in ancient times was entered.

Adjourn. To put off to another day; to discontinue a while; to intermit proceedings; as, of a court-martial, a board of examination, etc. When no certain day is fixed to which the adjournment is to extend, it is said to be *sine die*.

Adjudication. The act of adjudging prizes by legal decree. Captors are compelled to submit the adjudication of their prizes to a competent tribunal.

Adjust. To set the frame of a ship. To regulate an instrument for use. *To adjust the compasses* is to ascertain the deviation of the needle due to local attraction.

Adjustment, in marine insurance, is the ascertaining and settling of the amount of indemnity, whether of average or salvage, which the insured is entitled to receive. The nature and amount of damage being ascertained, an endorsement is made on the back of the policy, declaring the proportion of loss falling on each underwriter; and when this endorsement is signed by the latter, the loss is said to have been adjusted. After an adjustment has been made, it

is usual for the underwriter at once to pay the loss. As a question of law, however, it does not appear how far the adjustment is conclusive and binding on the underwriters. In the opinion of some lawyers the adjustment is merely presumptive evidence against an insurer, and it is, notwithstanding, open to the underwriter to show facts which, if proved, would have the effect of relieving him from liability.

ADJUSTMENTS OF INSTRUMENTS. All nautical instruments are liable to get out of order, their several parts not retaining their relative positions, owing to unequal expansion, violence, or like causes. To guard before observing against resulting errors, there are *methods of testing* whether the instrument is in order in the several points subject to be affected; and the instrument is provided with *means of adjustment*, chiefly in the form of screws or sliding weights, by which it may be restored to its correct state. Adjusting screws and weights ought not to be touched more than is absolutely necessary, and then with great care. When two such screws work oppositely to each other, one must not be tightened without the other being at the same time loosened. Sometimes, instead of making the adjustment, the error may be acknowledged and allowed for in observing. The term "adjustments" is often loosely applied to all sources of incorrectness, and means of obviating their effects, in using instruments. These are, however, properly of three distinct kinds: *imperfections* in the instrument, which should cause its rejection; *adjustments* for parts of the instrument liable to temporary derangement, but which can be restored to order by the machinery attached; and *errors* of the instrument, which are acknowledged, determined by experiment, and allowed for. See COMPASS and SEXTANT.

Adjutant. See MARINE CORPS.

Admeasurement. The calculation of the proportions of a ship according to assumed rules.

Administration, Naval (Lat. *ad*, "to," and *ministro*, *ministratum*, "to serve," management, conduct of business), relates to the management of that part of the executive branch of the government which includes the navy, or *military marine*. The Chief Executive is generally the constitutional or hereditary head of the navy. James I., of England, assumed the title of Lord High Admiral and Lord General; in other words, he declared himself to be the commander-in-chief of the army and navy. This was subsequently confirmed to the reigning sovereign by act of Parliament (13 Car. II., c. 6). In the United States the President is the Commander-in-Chief of the Army and Navy, "and he may require the opinion in writing of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices." (Constitution of the United States, Art. II., Sec. 2.) One of these "executive departments" is styled, by the act of April 30, 1798, which creates the office, the *Department of the Navy*, and the "principal officer" the *Secretary of the Navy*, whose duty it is "to execute such orders as he shall receive from the President of the United States relative to the procurement of naval stores and materials, and the construction, armament, equipment of vessels of war, as well as all other matters connected with the naval establishment of the United States. From the language of the act it will be seen that the Secretary of the Navy is, in all matters pertaining to his branch of the public service, the exponent of the President; and his acts are to be considered the acts of the President, and have full force and effect as such. The official duties of the heads of executive departments, however, are not merely ministerial; they involve the exercise of judgment and discretion. (Decatur *v.* Paulding, 14 Pet., 515.) The Secretary of the Navy is appointed by the President, by and with the advice and consent of the Senate, from civil life, and is one of the members of his Cabinet. He is authorized by law to prescribe regulations, not inconsistent with law, for the government of his department, the conduct of its officers and clerks, the distribution and performance of its business, and the custody, use, and preservation of the records, papers, and property appertaining to it. He is required to make an annual report to Congress of the operations of the navy for the preceding year, its general condition, etc. The business of the Department is distributed among eight bureaus, to wit: (1) Bureau of Yards and Docks, (2) Equipment and Recruiting, (3) Navigation, (4) Ordnance, (5) Construction and Repair, (6) Steam Engineering, (7) Provisions and Clothing, (8) Medicine and Surgery. The chiefs of bureaus are appointed by the President, by and with the advice and consent of the Senate. All the duties of the bureaus are performed under the authority of the Secretary of the Navy, and "their orders are considered as emanating from him and have full force and effect as such" (act of August 31, 1842). There are 63 clerks, draughtsmen, etc., in the Department, 17 of whom belong to the Secretariat, the remainder to the several bureaus. The chiefs of four bureaus (1, 2, 3, and 4) are selected from the line-officers not below the rank of commander. During the time of holding office they have the relative rank of commodore, if below that grade. The chiefs of the other bureaus are selected from the several corps which they represent, and while holding office have the relative rank of commodore, with the title respectively of surgeon-general, paymaster-general, engineer-in-chief, and chief constructor. Chiefs of bureaus hold their offices for the term of four years. Any staff officer who has performed the duty of a chief of a bureau for a full term is exempt thereafter from sea-duty, except in time of war, and retires with the relative rank of commodore.

It will be perceived from the foregoing that the Navy Department, and consequently the navy itself, is without a professional head. The civil branch is well provided for in the constitutional commander-in-chief and his constitutional adviser, the Secretary of the Navy. But regarding the navy in its true character of a *sea army*, there is no professional head in our naval administration to govern its purely military operations. This is a great, and, in time of war, would be likely to prove a fatal, defect. It would be difficult, indeed, to find a civilian in whom were combined the political training essential to a Cabinet officer and the technical knowledge necessary to an intelligent and energetic administration of naval affairs even in times of profound peace.

The history of our naval administration is curious. The infant navy was ushered into ex-

istence by spasmodic resolutions of the Continental Congress. On the 5th of October, 1775, a resolution directed the fitting out of two armed schooners to cruise for a vessel known to have left England with munitions of war for the enemy. A week later another resolution directed the equipping of a swift vessel of 10 guns, and three members of Congress — Messrs. Deane, Langdon, and Gadsden—were chosen a committee to superintend this "naval force." October 20 four members—Hopkins, Hewes, Lee, and John Adams—were added, when it was resolved that "these seven be a committee to carry into execution with all possible expedition the resolutions of Congress for fitting out armed vessels." The committee immediately procured a room in a public-house in Philadelphia, and agreed to meet every evening at 6 o'clock for the dispatch of business. January 25, it was resolved that the direction of the fleet fitted out by order of Congress be left to the Naval Committee. In subsequent resolutions this committee was styled the *Marine* Committee, and was empowered to give names to ships, to order them on service, purchase materials, etc. June 9, 1779, it was resolved that the management of all business relating to the marine of the United States be vested in commissioners. October 28, 1779, a Board of Admiralty was established to superintend the naval and marine affairs. February 7, 1781, the office of a Secretary of Marine was created. August 20, on the report of a committee, it was resolved that "for the present an agent of marine be appointed," who should absorb all the duties that had devolved upon the Board of Admiralty. On the termination of the war of the Revolution (1783) the navy was disbanded. The present government went into operation under the Constitution March 4, 1789, and on the 7th of August following an act was passed establishing the Department of War, the Secretary of which was to have a general supervision of the land and *naval* forces. April 30, 1798, the act was passed creating the Department of the Navy, a Secretary of the Navy, a principal clerk and such other clerks as he (the Secretary) thought necessary. The act of February 7, 1815, added to the Department a Board of Navy Commissioners, consisting of three officers of the navy not below the rank of post-captain. The act provided that "the board so constituted should be attached to the office of the Secretary, and under his superintendence discharge all the ministerial duties of that office relative to the procurement of naval stores and materials, and the construction, armament, equipment, and employment of vessels of war, as well as other matters connected with the naval establishment." The act of August 31, 1842, abolished the naval commissioners and substituted five bureaus, since increased, by act of July 5, 1862, to eight. By act of July 31, 1861, the office of Assistant Secretary of the Navy was authorized, the exigencies of war showing its necessity. The office was abolished soon after the war (March 3, 1869).

The act of March 2, 1865, created the office of Solicitor and Judge-Advocate-General. June 22, 1870, it was transferred to the Department of Justice, as *Naval Solicitor* (Sec. 249, Revised Statutes). For that important factor of the navy, the Marine Corps, see article under that head.

GREAT BRITAIN.—Immediately after the revolution of 1688 Parliament passed an act (2 Sess. William and Mary) establishing a Board of Admiralty; thus giving the sanction of law to the practice that had long prevailed, of placing the control of the navy in the hands of experienced officers. By this act it was "declared and enacted that all and singular authorities, jurisdictions, and powers which, by any act of Parliament or otherwise, have been and are lawfully vested . . . in the Lord High Admiral of England for the time being, have always appertained to, and may be exercised by, the Commissioners for executing the office of High Admiral of England for the time being according to their commissions." Two years later, it was resolved in the House of Commons that "His Majesty be advised to constitute a commission of the Admiralty of such persons as are of known experience in maritime affairs; that for the future all orders for the management of the fleet do pass through the Admiralty that shall be so constituted."

The Admiralty patent, as it is called, places in the hands of "Our Commissioners for executing the office of Our High Admiral" full power to administer the affairs of the navy. It enjoins upon all persons belonging to the navy to observe all such orders as "Our said Commissioners, or any two or more of them, give," . . . "as if Our High Admiral had given it." According to the patent, all the members are equal, with co-ordinate powers, and with joint responsibility. According to usage the responsibility rests almost entirely with the First Lord. He nominates the other members "at his pleasure." He is, therefore, practically supreme; if opposed by the other members he may break up the board. Besides the First Lord, who is a cabinet officer appointed almost invariably from civil life by the Prime Minister, there are three naval members, and one other, who is always taken from among the members of the House of Commons. The board meets every week-day at noon, except Saturdays, and two lords and a secretary form a quorum for business. Certain orders may be signed by the secretary of the board alone, and are regarded as the order of the board collectively; but an order that authorizes the payment of money requires the signatures of two lords. The secretaries have jointly charge of the Secretariat, and the First Secretary has important duties in Parliament in connection with the board. See ADMIRALTY.

It will be seen from the foregoing that the First Lord has general control of the navy in the name of his sovereign, to whom he is responsible for its management. But he represents the civil power, and concerns himself more immediately with the civil affairs of the navy. Associated with this civil office, but subordinate to it, is the military branch of the establishment. This is presided over by professionals,—the senior Sea Lord and his coadjutors, the other Sea Lords and the Naval Secretary.

No form of naval administration can hope for entire immunity from public criticism; the Board of Admiralty forms no exception to the rule. The slightest mishap in the navy is sufficient to call down the thunders of the press on the heads of the Lords of the Admiralty. Discussions in Parliament led (March, 1861) to the appointment of a committee "to inquire into the con-

stitution of the Board of Admiralty and the various duties devolving thereon;" also "as to the general effect of such system on the navy." No material change took place, however, till January 14, 1869, when Mr. Hugh C. E. Childers, then First Lord, reorganized the board. On the 19th of March, 1872, the order of 1869 was rescinded, and the board restored very much to its old organization and as it now stands. See ADMIRALTY.

FRANCE.—The *Minister of Marine* (Secretary of the Navy) in France is generally selected from the list of admirals, and represents both the civil and military power. He is assisted in his immediate office by a staff of about seven officers, ranking from rear-admiral to lieutenant. The chief of staff is a rear-admiral (*chef d'état-major et chef du cabinet*). Next comes a Board of Admiralty, of which the Minister of Marine is president. It consists of, 1, a vice-admiral, who is vice-president of the board; 2, a vice-admiral; 3, a general of marine artillery; 4, a vice-admiral; 5, a vice-admiral; 6, a rear-admiral; 7, a director of naval construction; 8, a commissary-general. The Secretariat is divided into two *bureaux*, each of which has its chief. The second *bureau* takes cognizance of the "movements of the fleet and military operations," and is presided over by a naval officer of rank. Next we have the Navy Department proper, which is divided into five *directions* (a *direction* corresponding to a bureau in our Navy Department), each *direction* having two or more *bureaux;* each *bureau* having two or more *sections*. Among these several *directions*, *bureaux*, and *sections* are distributed with much precision all the duties of an extensive and thorough naval administration. The Minister of Marine alone is responsible to the chief magistrate for his acts. The Board of Admiralty, of which he is president, is but an advisory body, its chief and only important duty being to prepare the annual lists of officers from which the selections for promotion are made. It has, in fact, but little, if anything, to do with the administration of the affairs of the French navy.

It may be said, in general, that under a liberal form of government, like that of the United States or Great Britain, where the civil power predominates, the head of the navy will always be a civilian. In countries where the military spirit prevails the head of the navy will always be a naval officer of rank. In *all* maritime countries the work of the navy department must be distributed among a number of experts and a certain clerical force.

AUSTRIA.—The Minister of National Defense presides over both war and navy departments. Under his general supervision a vice-admiral administers the affairs of the navy.

DENMARK.—The Minister of Marine is a cabinet officer and a naval officer of rank.

GERMANY.—Has a Board of Admiralty, with an admiral for "Inspector-General of the Navy," and a commander-in-chief of all the ships in commission.

ITALY.—Has a Minister of Marine, at present a rear-admiral, assisted in his duties by a Board of Admiralty.

RUSSIA.—The Minister of Marine is an admiral, and communicates directly with the sovereign. He has sole charge of the administrative department of the navy, while the executive branch is in charge of the High Admiral of the fleet. In other respects the organization is similar to that of the French.

SPAIN.—Has a Board of Admiralty.

The navy departments of other European governments do not vary in any important point from those already given.—*S. B. Luce, Captain U.S.N.*

Admiral. Sir Wm. Monson, writing about 1600, says, "There have been often disputes whether the title of Admiral or General were more proper to a sea commander; and though I dare not presume to conclude of either, yet I think it is as unproper to call an Admiral General by Sea as to call a General Admiral by Land, though I confess their authorities are like in command of men's persons, yet is the jurisdiction of the Admiral by sea greater than the other, in that he ruleth and guideth a fleet of ships, which are of more importance to the King and State than the lives of men that are to serve in them."

The English title of *admiral*,—in French and Danish, *amiral;* German, *ammiral;* Dutch, *admiral*, or *ammrael;* Italian, *ammiraglio;* Spanish, *almirante*,—evidently in all modern languages derived from the same source, is yet of doubtful etymology. Most of the old writers trace it to the Arab *emir* or *amir*, a prince or ruler, and a Greek word signifying the sea; but Spelman, who condemns this "Centaur" derivation, thinks the term was first in use among the Saracens, and from thence brought to England about the time of Richard I. or Henry III.; "for I find," he says, "that not only *Amera* but *Almirante* was the ordinary title of the Governors of countries through all the territories of the Saracens, even from Spain when they possessed it, unto the uttermost parts of Lesser Asia, and Mahomet was so called as king, a name of dignity and estimation." In the great ship or dromond taken by Richard I. from the Saracens there were *seven* admirals.

The Earl of Berkeley is said to be the only individual not of royal blood who has ever won the flag of Lord High Admiral of Great Britain at sea. At the age of 20, then known as Lord Dursley, he was captain of the "Lichfield," 50, his second command. When 23 he commanded the "Boyne," 80. At 27 he was vice-admiral of the blue, and the next year vice-admiral of the red. March 29, 1719, at the age of 38, he hoisted his flag on the "Dorsetshire" as Lord High Admiral, being actually Vice-Admiral of England and First Lord of the Admiralty.

The first English admiral on record is Richard de Lacy, to whom, 1216–72, Henry III. granted *Maritimam Angl*æ. Some, however, assert that the honor belongs to Roger de Leyburn, who was appointed by Edward I. *Admirallus Maris Regis* A.D. 1297. During the reign of Edward I. there were three admirals in contemporary command of the three coasts of England, one having jurisdiction from the mouth of the river Thames northward, another from the same point westward, and another of the west coast, including the shores of Wales and Ireland.

All admirals in the Royal navy were wont anciently to carry St. George's flag at the head of the topmast, but on the accession of James I. he added to it the cross of St. Andrew, as due to Scotland. The Lord High Admiral alone was

permitted to wear "the cross of the arms of England,"—that is, the standard of England at the main. He had also the power in the sixteenth century to permit another man to wear the bare English flag in the main-top in his presence. Sir Wm. Monson speaks of the *Rear-Admiral* as a recent invention, and says, "The Vice-Admiral wears his flag in the fore-top, being Vice-Admiral, so he is to wear what colored flag he pleases in the main-top as Admiral of a squadron. The Rear-Admiral wears his flag in the mizzen, and every ship besides is to wear a streamer of the same color in the forehead or mizzen-yard to be distinguished from other squadrons."

The Sicilians or Genoese are said to have been the first who, at the beginning of the Crusades, conferred the rank on the commander of a squadron of ships.

"St. Louis" introduced the title into France. The rank of Admiral was formerly equivalent to that of a Marshal of France, and a decree of Phillippe-le-Bel ordains that "each wing of our army must be commanded by a Prince, an Admiral, or a Marshal." It also constituted the fourth dignity of the order of Malta. The admirals of France possessed such great prerogatives that Richelieu suppressed the title, and invested himself with their functions, under the name of "Grand Master, Chief and Superintendent-General of Navigation and Commerce." Louis XIV. revived the title of Grand Admiral in 1669, but he reserved to himself the nomination of the officers and the right of giving orders direct to flag-officers. Notwithstanding these restrictions the privileges attaching to this post were enormous, comprising the nomination of the officers belonging to the naval courts of justice, the delivery of passports, permissions, and furloughs, the countersigning of royal decrees, and the receipt of a tithe of all prize-money and fines levied in admiralty courts. So valuable were these privileges, that when the Duc de Penthierre abandoned his claims to them in 1759, he received in compensation an annual grant of about $30,000, which was regularly paid until the revolution.

The first "Admiral of France" was Florent de Varennes, who, appointed by St. Louis, accompanied his sovereign in the expedition to Tunis; and since his day down to 1791, when the title was abolished by the National Assembly, it was conferred upon 59 different persons.

The most celebrated of these naval commanders were—

Nicolas Béluchét, who seized Portsmouth, England, in 1339;

Jean de Vienne, Seigneur de Clairveaux, who was killed in the battle of Nicopolis;

Gaspard, Comte de Coligny, a victim of St. Bartholomew;

Anne de Joyeusq, a devoted adherent of Henry III., killed at the battle of Contras;

François de Coligny, the eldest son of the murdered admiral;

Charles de Gontaut, Duc de Biron, the trustiest counselor of Henry IV., who was afterwards beheaded for high treason; and

François de Vendôme, Duc of Beaufort, nicknamed "Le Roy des Halles," who, appointed Grand Master of Navigation, was killed at the siege of Candia.

The *Comte de Vermendois* and the *Comte de Toulouse* were also appointed "Admirals of France," one at the age of two, and the other at the age of five, years.

Napoleon, in 1805, conferred the dignity of "Grand Admiral" on Murat; but the post, abolished at the revolution, was merely honorary, and as such was held by the Duc de Angoulême after the Restoration. The title of "Grand Admiral" was finally suppressed after the revolution of 1830.

The French have now the titles of admiral, vice-admiral, and rear-admiral in their navy.

On the establishment of the Continental navy, or a few months later, viz., November 15, 1776, having established the rank and command of the captains the month previous, Congress resolved that an "admiral should rank as a general; a vice-admiral as a lieutenant-general; a rear-admiral as a major-general;" evidently looking to the addition of those ranks to the navy. The prejudices of the people, however, prevented the establishment of such high-sounding titles (?), and, until 1862, no officers were commissioned in the United States navy of higher rank than captain, except in 1859, when, in special compliment to his services, Charles Stewart was commissioned as "Senior Flag-Officer."

The act of July 16, 1862, reorganizing the navy, was the first to recognize the necessity of the grade, and authorized the commissioning of not more than nine rear-admirals on the active list, and nine on the retired or reserved list, the former "to be selected, during the wàr, from those commanders who have distinguished themselves, or shall hereafter eminently distinguish themselves, by courage, skill, and genius in their profession; *Provided*, That no officer shall be promoted to this grade unless, upon recommendation of the President, by name, he has received the thanks of Congress for distinguished service. During times of peace vacancies to this grade shall be filled by regular promotion from the list of commodores, subject to examination as to mental, moral, physical, and professional qualifications." "The three senior rear-admirals were to wear a square blue flag at the mainmast-head, the next three at the foremast-head, and all others at the mizzen." Rear-admirals to have relative rank with major-generals.

The same law authorized nine rear-admirals on the retired list, ranking relatively with major-generals, who were to be selected by the President, by and with the consent of the Senate, "from those captains who have given most faithful service to the country." After these were commissioned, promotion to rear-admiral on the retired list was to be by seniority, subject to an advisory board.

Under this law David G. Farragut, Louis M. Goldsborough, Samuel F. Dupont, and Andrew H. Foote were commissioned July 16, 1862, Charles H Davis and John A. Dahlgren, February 7, 1863, David D. Porter, July 4, 1863, on the active list, and Charles Stewart, William B. Shubrick, Joseph Smith, George W. Stone, Francis H. Gregory, Elias F. Lavallette, S. H. Stringham, Samuel L. Breese, Hiram Paulding, George C. Read, on the retired list. Rear-Admiral George C. Read died on the 22d of August, 1862, the first rear-admiral to die in our navy, and Rear-Admiral Lavallette died on the 18th of November following. Of all the above-named

rear-admirals, in 1880 all were dead excepting Rear-Admiral David D. Porter, then the admiral of the navy.

Under this law, as senior rear-admiral, Farragut hoisted his plain square blue flag at New Orleans, on the mainmast-head of the "Hartford." He received his commission August 12, 1862, and the next morning, on the hoisting of the colors, his flag was run up for the first time at the main, when it was saluted by the whole squadron; soon after which the flag-ship "Hartford," accompanied by the "Brooklyn," proceeded down the river, the remaining ships of the squadron dipping their ensigns as the "flag-ship" passed. This was the first admiral's flag hoisted at the main in our navy. Subsequently the law was amended, and Farragut, as a rear-admiral, retrograded his flag to the mizzen, thence, on his promotion to vice-admiral, advanced it to the fore, and on his promotion to admiral, July 25, 1866, raised it again high up on the main.

On the 21st of December, 1864, the grade of vice-admiral was first introduced into our navy, and Farragut was our first vice-admiral. On his promotion to a full "admiral," July, 1866, Rear-Admiral David D. Porter was made a vice-admiral, and on the death of Farragut, August, 1870, he was made admiral of the navy, and Stephen C. Rowan vice-admiral. Under existing laws, on the death of the present admiral and vice-admiral those grades become extinct in our navy, and rear-admiral will be the highest rank.

At present there are in the United States navy one admiral, one vice-admiral, and eleven rear-admirals on the active list, and forty-two on the retired list, who have been retired for long and faithful service.

An admiral may command a fleet or fleets.

A vice-admiral may command a fleet, or a division of a fleet under the admiral; be commander-in-chief of a squadron; or may command a naval station.

A rear-admiral may command a fleet or squadron, a squadron or division under an admiral or vice-admiral; be chief of staff of a naval force under an admiral or vice-admiral; or may command a naval station.—*George H. Preble, Rear-Admiral U.S.N.*

Admiral. The epithet of *admiral* was formerly applied to any large or leading ship, without regard to flag, and is still used in the whale- and cod-fisheries. The first vessel to arrive in any port in Newfoundland retains this title during the season, the second becomes the *vice-admiral*, and the third the *rear-admiral.*

Admiral. A shell of the genus *Conus.* The varieties are designated as the *grand-admiral*, the *vice-admiral*, the *orange-admiral*, and the *extra-admiral.*

Admiralty. "The Admiralty" means the Lord High Admiral of England, or the commissioners for executing his office, commonly called the Board of Admiralty. It dates from 1512, when Henry VIII. appointed a board of commissioners to examine into and report upon the state of the navy. In 1660, James, Duke of York, became the first Lord High Admiral. On his accession to the throne (1685) the office was put in commission. On the accession of William and Mary (1689) Parliament passed an act legalizing and rendering permanent the board of experts that had from time to time been called upon to administer the affairs of the navy. The office remained in commission till 1702, when George, Prince of Denmark, became Lord High Admiral. The office was again in commission from 1708 to 1827, when William, Duke of Clarence, the "Sailor Prince," became Lord High Admiral. He resigned August 12, 1828. Since then the office has been in commission, and will probably remain so, till the present Duke of Edinburgh is appointed to fill it.

The Board of Commissioners is thus constituted, under Orders in Council, 19th March, 1872:

(1) First Lord of the Admiralty, First Naval Lord, Second Naval Lord, Junior Naval Lord, Civil Lord.

(2) The Parliamentary Secretary, Permanent Secretary, Naval Secretary.

(3) The Comptroller of the Navy, assisted by a Deputy Comptroller, and Director of Dock-Yards.

(4) The First Lord to be responsible to the Crown and to Parliament for all the business of the Admiralty, divided as follows: (*a*) The First Naval Lord, Second Naval Lord, and Junior Naval Lord to be responsible to the First Lord of the Admiralty for the administration of so much of the business relating to the *personnel* of the navy, and to the movement and condition of the fleet, as shall be assigned to them from time to time by the First Lord. (*b*) The Comptroller to be responsible to the First Lord for the administration of so much of the business as relates to the *matériel* of the navy, the Comptroller to have the right to attend the board, and to explain his views, whenever the First Lord shall submit to the board for their opinion designs for ships, or any other matters emanating from the Comptroller's department. (*c*) The Parliamentary Secretary to be responsible to the First Lord for the finance of the department, and for so much of the other business of the Admiralty as may be assigned to him. (*d*) The Civil Lord, the Permanent Secretary, and the Naval Secretary to have such duties as shall be assigned to them by the First Lord. The First Lord is nearly always appointed from civil life.

THE ADMIRALTY, the Navy Office, Whitehall, London.—*S. B. Luce, Captain U.S.N.*

Admiralty Courts (in law). The Constitution declares that the judicial power of the United States shall extend . . . "to all cases of admiralty and marine jurisdiction." By act of Congress a district court of the United States is empowered to sit as an admiralty court for the trial of all ordinary causes originating on the high seas, or on rivers, ports, or harbors communicating with the sea. The more serious cases are referred to the circuit courts, sitting as courts of admiralty.

Admiralty Droits. The revenue arising from enemies' ships detained in prospect of war; from enemies' ships coming into port in ignorance of hostilities; from ships captured by non-commissioned captors; from the proceeds of wrecks and goods of pirates.

Admiralty Midshipman. (*Eng.*) Formerly one who, having served his time and passed his examination, was appointed to a ship by the admiralty, in contradistinction to those who were rated by the captain.

Adonis. An anguilliform fish.

Adornings. The ornamental work on the quarter and stern galleries.

Adown. The bawl of privateersmen for the crew of the captured vessel to go below.

Adreamt. Dozing.

Adrift. Floating at random. The state of a vessel or boat broken from her moorings and driven to and fro by the wind, sea, or tide. Also used of a thing that has broken from its place; as, a gun from the ship's side, etc.

Ad Valorem. In its application to custom duties signifies a duty or tax on importations that is levied with reference to the value of the goods.

Advance. An amount of an officer's salary which he is allowed to receive in advance when ordered on sea-duty. If ordered to the Asiatic Station he may draw three months' pay in advance, and on other sea-duty two months' pay. The advance is paid by navy pay agents, on presentation of the officer's orders, upon which the pay agent must indorse the payment. This indorsement is notice to the paymaster of the vessel to which the officer is ordered, and it is his duty to deduct the advance from the officer's future earnings. Officers ordered to a vessel in a United States port are entitled to receive their current pay up to the date of sailing, without regard to the advance received from the pay agent. Officers receiving an advance are required to give notice thereof in writing to the paymaster of the vessel to which they are ordered. Failure to do so will be deemed scandalous conduct and a violation of general orders.

Advance. To move forward. *Advance*, or *vanguard*, is that portion of a force which moves in front of the main body. *Advance list* is the list on which are registered the names of those who receive advance money. *Advance note* is a note issued by owners of ships, promising to pay a specified sum to a seaman within a specified number of days after he has sailed on a voyage.

Advancement. Promotion to a higher rank or grade.

Advantage, or Vantage-ground, is that which affords the greatest facility in attack or defense.

Adventure. An undertaking involving hazard; used in a commercial sense to signify a speculation in goods sent abroad to be sold or bartered for profit. *A bill of adventure* is one signed by the merchant, in which he takes the chances of the voyage.

Adversary. A term applied to an enemy, but strictly confined to an opponent in single combat.

Adverse. The opposite of favorable; as, an adverse wind or tide.

Advice. Counsel; suggestion. *Advices*, intelligence; news.

Advice-boat. A vessel to carry dispatches. They were first used in 1692, previous to the battle of La Hogue.

Advocate. A counselor; one who pleads the cause of another. See JUDGE ADVOCATE.

Adze, or Addice. A tool for dubbing flat or circular work. It is much used in the East, where it takes the place of axe, plane, and chisel.

Æ. See CLASSIFICATION OF MERCHANT VESSELS.

Æinautæ. Senators of Miletus, who held their deliberations on board ship.

Æratæ. Ancient ships with brazen prows.

Aerator. An apparatus for aërating water. Distilled water has an insipid taste unless it is subjected to the action of the air before being used. The same effect may be obtained by throwing calcareous substances into water confined in an air-tight vessel. An apparatus for fumigating grain.

Aerography. The description of the atmosphere, its nature, properties, limits, etc.

Aerolites. Solid bodies which descend to the earth's surface from beyond the atmosphere. They are composed principally of iron and a small percentage of nickel and cobalt.

Aerolites, meteors, fire-balls, and shooting-stars are classed together as being merely varieties of the same phenomenon. There is but little doubt that aerolites are bodies revolving about the sun like the planets, and are encountered by the earth in its annual motion around the sun. The comets, like the earth, must encounter an immense number of these bodies, and a part of their motion must be thereby destroyed. This effect may be appreciable in the case of periodic comets, though thus far it is inappreciable in the case of the earth and the other planets.

Aerology. The doctrine of air; generally applied to medical discussions respecting its salubrity.

Aeromancy. Formerly, the art of divining by the air. In modern times it means the foretelling of the weather by experience or by instruments.

Aerometer. An instrument for making corrections in pneumatic experiments.

Aerometry. The science of measuring the air, its power, pressure, and properties.

Aeronaut. A navigator of the air.

Aeronautics. The art of navigating the air.

Aerostatics. The science that treats of the equilibrium and pressure of the air and other gases.

Æstuary. See ESTUARY.

Æwul. A basket for catching fish.

Afeard. Afraid.

Afer. The southwest wind of the Latins.

Affair. An engagement of minor importance. *An affair of honor*, a duel.

Affidavit. A written statement attested by the oath of the person making it and subscribed by him. To give the oath legal effect it must be administered by a person thereunto authorized by law, who appends his certificate, technically called a "jurat." An affidavit differs from a deposition in being *ex parte*, the person making it not being subject to cross-examination.

Affirm. To make a solemn promise to tell the truth under the pains and penalties of perjury. To confirm.

Affirmative. The signal, the hoisting of which implies assent.

Affluent. A stream flowing directly into another stream; a more specific term than *tributary*.

Affreightment. A contract for the letting of a vessel, or a part of her, for freight. See CONTRACT OF AFFREIGHTMENT.

Afloat. Buoyed up and supported by the water; on board ship.

Afore. Farther forward, the same as *before*.

Afoul. See FOUL.

Africa. See CONTINENTS.

Aft. Abbreviation of *abaft*. *Right aft*, exactly astern. *To haul a sheet aft*, to pull the rope attached to the clew more towards the stern of the ship.

Aft-castle. In ancient days, a tower erected aft, on the upper deck. See FORECASTLE.

After. Comparative adjective applied to any object in the rear part of a vessel. *After-sails, -yards, -braces, -bowlines,* those on the main- and mizzen-masts. *After-body,* that portion of the ship's body abaft dead flat. *After-clap,* a subsequent unexpected event. *After-end,* the rear end. *After-face,* the rear face.

Afterguard. The men who are stationed on the quarter-deck and poop to man the gear. It is generally composed of landsmen, and they are not required to go aloft except to loose and furl the mainsail.

After-Hood. The aftermost plank in a strake, outside or inside.

Afternoon-watch. The period of time from noon till four o'clock. The men on duty during that time.

After-peak. The contracted part of the hold which lies in the vessel's run; the aftermost portion of the hold.

After-rake. The overhang of the stern.

After-timbers. The timbers abaft the midship section.

Aftmost, Aftermost. The objects nearest the stern.

Aftward. Towards the stern.

Aga. A superior Turkish officer.

Against the Sun. See WITH THE SUN.

Agal-Agal. One of the sea fuci. It derives its name from Tanjong Agal, on the coast of Borneo. It is thought the material for edible birds'-nests is derived from this fucus.

Agare. The American aloe from which cordage is made.

Age. In chronology, a period of a hundred years.

AGE OF THE MOON. The time elapsed since the last conjunction.

AGE OF THE TIDE. The interval between the transit of the moon at which a tide originates and the appearance of the tide itself. Called also *Retard of the Tide.*—See TIDE.

Agea. The horse-block or grating on ancient boats from which the captain gave his orders.

Agent. One intrusted with the business of another. See LLOYD'S AGENTS.

COMMERCIAL AGENT, a United States consular officer. These officers are peculiar to the United States, and are not regarded by other powers as entitled to the rank and privilege of consuls.

Agent, Navy Pay. An officer of the pay corps in charge of a navy pay office. His duties are to advertise for and purchase all supplies required by the Navy Department and its bureaus for the use of every branch of the navy; to pay mileage and traveling expenses of officers traveling under orders; to make advances to officers ordered to sea; to pay allotments; to furnish transportation for enlisted men; to pay certificates of indebtedness issued by the Fourth Auditor to claimants, and to act as a general disbursing agent for the Navy Department. He renders complete quarterly returns to the Fourth Auditor. Navy pay offices are established in Boston, New York City, Philadelphia, Baltimore, Washington, Norfolk, and San Francisco.

Aggression. The first act in provoking hostilities.

Agon. A Chinese cymbal. See GONG.

Agreement. (*Eng.*) In vessels of more than eighty tons the master must enter into an *agreement* with every seaman on board, and that agreement must be in the form sanctioned by the Board of Trade.

RUNNING AGREEMENT is an agreement extending over several voyages when they are less than six months in duration.

Aground. The situation of a ship when she touches or rests on the bottom.

Aguada. The Spanish and Portuguese term for a watering-place.

Ahead. Farther onward, or immediately before the ship.

AHEAD OF THE RECKONING. Beyond the position as determined by logging.

Ahold. To lay a ship *ahold* is to bring her to lie as close to the wind as possible.

Ahoo. Awry, aslant, lopsided.

Ahoy. An exclamation used in hailing a ship; as, *ship ahoy!* It means literally *stop.*

Ahull. A ship under bare poles, with her helm lashed a-lee, lying nearly broadside on to the wind and sea.

Aich's Metal. See GUN-METAL.

Aid. Assistance.

Aid. (See EXECUTIVE OFFICER.) An officer not above the rank of lieutenant on the personal staff of the commander-in-chief, and under the immediate direction of the chief of staff to perform such duties as may be assigned him, including that of secretary.

The commanding officer of a vessel is empowered to detail a junior officer to act as his personal aid.

There is attached to each navy-yard or station an officer not above the grade of commander, who is called senior aid to the commander, who acts as his principal aid in regard to the duties of the yard.

Aigre. The sudden flowing of the sea. See BORE.

Aiguade. (*Fr.*) Water for ship's use.

Aiguilletes. (*Fr.*) Tagged points or cords worn across the breast on some uniforms.

Ailettes. Small plates of metal placed on the shoulders on mediæval armor, the prototype of the modern epaulet.

Aim. The pointing of a weapon at the target. An order to point the weapon at the object.

Aim-frontlet. (*Obsolete.*) A piece of wood hollowed out to fit the muzzle of a gun so as to give a line of sight parallel with the axis of the bore.

Air. The atmosphere; the fluid which we breathe.

To AIR. To dry; to ventilate.

Air-bladder. A peculiar organ in some kinds of fishes by which they maintain their equilibrium in the water.

Air-blast. A current of air induced by a blower. See BLOWER.

Air-casing. A sheet-iron casing around the smoke-stack to protect the deck.

Air-chamber. A cavity containing air to act as a spring for equalizing the flow of a liquid in a hydraulic machine. See ORDNANCE.

Air Engine. An engine put in motion by hot air instead of steam; a caloric engine.

Air-funnel. A cavity formed by the omission of a timber in the upper works to admit fresh air into a ship's hold and convey the foul air out.

Air-furnace. A furnace with a natural draft and no blast.

Air-gun. A pneumatic machine for propelling projectiles. They have been constructed to carry as far as an ordinary musket.

Air-hole. A cavity in a casting formed by bubbles in the molten liquid. A vent-hole in a mold. A hole in the ice. A draft-hole in a register. A small hole in a cask to admit air when the faucet is turned on.

Airing Stage. A platform on which gunpowder is aired and dried.

Air-jacket. A garment capable of being inflated and used as a life-preserver.

Air-pipe. Funnels for clearing ships' holds of foul air. A small pipe leading from the hot well outboard.

Air-port. A scuttle cut in the bow, stern, or sides of a ship to admit air and light.

Airs. Light breezes.

Air-scuttle. A scuttle cut in the deck or grating for the admission of air.

Air-thermometer. An instrument in which the contraction and expansion of the air measure the temperature.

Air-tube. A small tube suspended in the coal-bunker for the purpose of ascertaining the temperature of the coal, as a precaution against spontaneous combustion.

Air-valve. See VACUUM-VALVE.

Akreyri. A town of Iceland, on the Eyiafiord. Lat. 65° 40′ N.; lon. 18° W. It has an excellent harbor.

Akyab. A town and seaport of British Burmah, in Aracan, on the E. side of the island of Akyab. It has an excellent harbor. Pop. 15,281.

Alamak. γ Andromedæ.

Alamottie. Mother Cary's chicken; the storm finch; the stormy petrel.

Aland. An old word for ashore, or to land.

Alarcon, Hernando de. A Spanish navigator of the 16th century, to whom we owe the first precise knowledge of California. He sailed May 9, 1540, in the service of Spain, missed a junction with the expedition of Coronado on the western coast of America, and, returning to New Spain in 1541, drew up his maps and observations. His discoveries, and those of Ulloa, were so complete that the map of California of 1541 differs little from that made in our own day.

Alarm. Any sound or information intended to give notice of approaching danger.

FALSE ALARM. An alarm which had no foundation in fact, being given through misapprehension, or through design, in order to exercise the men at their duties.

Alarm-gauge. A contrivance in the steam-engine for showing when the pressure of steam is too high or the water in the boiler too low.

Alarm-gun. A gun fired to give an alarm.

Alarmist. One who habitually excites alarm; one who is given to finding causes for alarm.

Alarms, Marine. Fog-bells, trumpets, horns, and whistles operated by the waves, winds, tides, currents, or by clock-work.

Alarms, Nautical. Contrivances on board ship to indicate a leak or the accumulation of bilge-water.

Albany-beef. A name for the sturgeon.

Albatross. A large sea-bird belonging to the genus *Diomeda.*

Alberton. A seaport town of Prince Edward Island. The port, called Cascumpeque, or Holland Harbor, is the best on the northern side of the island. Pop. 600.

Albion. A name for England, from the whiteness of the cliffs.

Alburnum. The slab-cuts of timber; the sapwood.

Alcatraz. The pelican.

Aldebaran. A star of the first magnitude, popularly known as the Bull's-eye. It is the bright star in the group of five called the *Hyades,* and is conspicuous by its ruddy color. See TAURUS.

Alden, James, Rear-Admiral U.S.N. Born in Maine. Appointed midshipman from same State, April 1, 1828.

Promoted to passed midshipman, June 14, 1834; navy-yard, Boston, 1835; exploring expedition around the world, 1838–42.

Commissioned as lieutenant, February 25, 1841; naval station, Boston, 1843; frigate "Constitution" around the world, second time, 1844–46; while attached to this vessel, commanded a boat expedition and cut out several war junks from under the guns of the fort at Zuron Bay, Cochin-China; home squadron during Mexican war; present at the capture of Vera Cruz, Tuspan, and Tobasco; naval station, Boston, 1847; coast survey, 1848–60; made a reconnoissance of all the West coast. In the winter of 1855–56, during the Indian war in Puget Sound, volunteered with the surveying steamer "Active" to co-operate with the army, and rendered important aid in bringing the war to a close; by his timely arrival in the spring of the same year at San Juan Island, prevented a collision between the British naval forces and the United States troops; assisted in landing troops enough to hold the island in dispute against the threatened attack of the British.

Commissioned as commander, September 14, 1855; commanding the steamer "South Carolina" at the commencement of the rebellion, May, 1861; reinforced Fort Pickens, while blockading Galveston, Texas; had a fight with the batteries in the rear of the city; while there, captured thirteen schooners laden with merchandise; commanded sloop "Richmond" at the passage of Forts Jackson and St. Philip and the engagement with Chalmette batteries and defenses of New Orleans; passage of Vicksburg batteries twice; Port Hudson, 1862–63.

Commissioned as captain, January 2, 1863; commanded steam-sloop "Brooklyn" in the action with Forts Morgan and Gaines and the rebel gunboats in Mobile Bay; commanded two attacks on Fort Fisher. Capt. Alden took a prominent part in all the great naval battles of the war, and was handsomely mentioned in the official reports.

Commissioned as commodore, July 25, 1866; commanding steam-sloop "Susquehanna," special service, 1867; commanding steam-frigate "Minnesota," special service, 1867–68; commandant navy-yard, Mare Island, California, 1868–69; Chief of Bureau of Navigation and Detail, Navy Department, 1869–71; promoted to rear-admiral, 1871; commanding European Squadron, 1872; retired, 1873; died, 1877.

A-lee. The contrary of *a-weather.* The position of the helm when the tiller is put over to the lee side of the ship.

HELM'S A-LEE. The order to let go the head-sheets when the helm is down.

Alert. Watchful; vigilant; on the look-out, and ready for any emergency.

Alewife. A fish of the herring kind.

Alexandria. A celebrated city and seaport of Egypt, near the westernmost branch of the Nile, on the Mediterranean, 112 miles N.W. of Cairo. Alexandria has a large naval arsenal, naval and military hospitals. The city has an excellent new artificial harbor, formed by a breakwater, mole, and quays. It has regular steam communication with all the great Mediterranean ports, and is the great emporium of Egypt. Pop. 220,000.

Alexandria. A city and port of entry in Virginia, on the right bank of the Potomac, 7 miles below Washington. The river here is a mile wide, and forms a commodious harbor sufficiently deep for the largest ships. Pop. 14,000.

Alexiacus. An appellation of Neptune.

Alfondiza. The custom-house at Lisbon.

Alga. A species of millepora.

Algæ. Flowerless, cryptogamic plants, cellular, found chiefly as sea-weeds, but also in rivers, marshes, springs, hot and cold, and moist places everywhere. About 2000 species are known and have been described, and among these there is a great variety of forms. Some are attached to rocks, and others are entirely free. None of them have proper roots, but merely processes for their attachment to the surfaces on which they are fixed. They derive their sustenance exclusively, it would seem, from the medium surrounding them, in which respect, as well as in their composition, they differ from fungi. Their substance consists chiefly of vegetable gelatine, soluble in boiling water; the harder parts of their fronds are sometimes leathery, or horny, or cartilaginous, but never really ligneous. They are composed entirely of cells, some consisting of one cell only; the composite ones are easily separable, and the individual cells are generally capable of independent existence, as in the case of the proto-coccus, or red snow plant. The spores and fronds of algæ are frequently of the same color, the most common colors being brown, or orange-brown, rose color approaching red, or green. Algæ are multiplied by division of cells and by spores. Fertilization is effected by conjugation or union of cells, the contents of one passing into another and giving rise to germinating spores. This is seen in the confervæ of stagnant ponds. Other algæ are fertilized by moving filaments or spermatozoids. Others contain a rudimentary cell which, by contact with spermatozoids, becomes a spore and then a new plant. There are also zoöspores which move about in the water, the cells ultimately bursting and scattering them, and the cilia by which they moved disappearing as the spores become fixed. Many of the algæ supply nutritious food, others are of value as yielding barilla, an impure carbonate of soda largely used in manufacturing, and all are useful as manure. Some species are of immense length and size, such as *Macrocystis pyrifera*, *Lessonia fuscescens*, and *D'Invillea utilis*, which are found hundreds of feet long and as thick as the human body. More frequently, however, they are small, varying from a few inches to several feet in length, while some species are visible only through the microscope. The distribution of algæ as to depth varies; their actual depth is still a disputed point with naturalists. It is impossible in the present state of knowledge to estimate their extreme limit, but *vegetation*, as usually understood, is practically limited to depths under 100 fathoms. Very few of the higher algæ live, even occasionally, on the surface of the sea; a notable exception is the gulf-weed, so called (*Sargassum bacciferum*), which see.

Algeciras. A seaport town of Spain, on the W. side of the Bay of Gibraltar, opposite to and 6 miles W. of Gibraltar. Pop. 14,000.

Algenib. γ Pegasi.

Algere. A spear used by fishermen in olden times.

Algiers. A city of North Africa, on the W. side of a bay of its own name. Lat. 36° 47′ 3″ N.; lon. 3° 4′ 5″ E. The harbor has a mole 580 feet in length by 140 in width, extending from the mainland to an inlet, on which are a strong castle with batteries and a light-house. Pop. 54,000.

Algol. A variable star in Perseus.

Algorab. α Corvi, but its brightness of late is rivalled by β Corvi.

Alibi. The Latin word meaning elsewhere. Before courts-martial, as well as in those of civil jurisdiction, when an accused person proves that at the time of the commission of the alleged offense he was somewhere else than at the scene of the offending, he is said to have proven an *alibi*.

Alicante. A city and seaport of Spain, located at the head of an extensive bay. Lat. 38° 27′ 7″ N.; lon. 0° 26′ W. The harbor is only a roadstead in a deep bay, small vessels alone being able to approach the quay. Pop. 30,000.

Alidade. The movable arm of an instrument fitted with sights or a telescope.

Alien. (Lat. *alienus*, belonging to another, foreign.) In England, by the common law, an alien was one born out of the king's dominions or allegiance. The only exceptions to this rule were such children of the king as might be born abroad, and the children of his ambassadors so born. By several statutes, to wit: 25 Edw. III., passed in 1350; 29 Charles II., 1676; 7 Anne, 1708; 10 Anne, 1711; 4 Geo. II., 1731; 13 Geo. III., 1773; 7 and 8 Vict., 1844, the common law rule has been altered, so that now all children born out of the king's allegiance whose fathers (or grandfathers by the father's side) or whose mothers were natural-born subjects, are deemed to be natural-born subjects themselves, unless their said ancestors were attainted or banished beyond sea for high treason, or were at the birth of such children in the service of a prince at enmity with Great Britain.

In this country an alien is one born out of the limits and jurisdiction of the United States. The children of fathers, however, who at the time of such children's birth were citizens of the United States, and had resided in the United States, are, notwithstanding the fact of being born abroad, citizens. An alien becomes a citizen by naturalization (which see). In time of war a valid contract cannot be made between a citizen and an alien enemy, nor can such a contract be enforced after peace has been declared. During a war an alien enemy cannot prosecute an action of any

kind in the courts of the United States; his right of action, however, revives on the declaration of peace. See INTERNATIONAL LAW.

Alignment. An imaginary line to regulate the formation of a squadron.

Alioth. The star ϵ *Ursæ Majoris.*

All. The whole; quite.

ALL AGOG. In a flurry of excitement.

ALL AHOO. Confused; awry; aslant.

ALL-A-TAUNT-O. Fully rigged with masts an-end, yards crossed, and rigging rove.

ALL HANDS. The whole ship's company.

ALL HANDS! The boatswain's summons for the whole crew, in distinction from the watch.

ALL READY FORWARD, ALL READY THE MAIN, etc. The notice that a particular part of the ship is ready for the next order.

ALL STANDING. Fully equipped. *To be brought up all standing* is to be suddenly stopped without any preparation.

ALL'S WELL. The sentry's call as each bell is struck, from tattoo to reveillé.

ALL TO PIECES. Out-and-out; excessively.

ALL WEATHERS. All times and all seasons.

ALL IN THE WIND. The sails shivering.

ALL OF A HEAP. Dumfounded; confused.

STERN ALL. The shout of the harpooner when the fish is struck.

HAUL OF ALL. To swing all the yards at the same time.

ALL UP AND AFT. The report of the officer of the deck when the officers and men are assembled on the quarter-deck ready for muster.

Allan. A piece of land nearly surrounded by water.

Allege. (*Fr.*) A ballast-boat.

Allegiance. The tie which binds the citizen to his sovereign or country. Its full consideration involves an examination of the right of a citizen to expatriate himself, a matter about which there is a conflict of theories. The common law of England denies the right of the subject to throw off his allegiance to the country of his birth, and European nations generally have taken the same position, while in the United States we require of persons seeking naturalization the renunciation of their former allegiance. The inherent difficulties of the subject make it improbable that any solution will ever be attained by legislative action, but it may be assumed that the sense of humanity of enlightened nations at this day will prevent being treated as criminals, persons who, by the silent acquiescence, and, therefore, the presumed consent of the country of their birth, have removed to other countries and assumed a new allegiance, even if they should be taken in arms against their native country. Many of the questions growing out of the subject have been disposed of by treaties between the United States and foreign nations. See NATURALIZATION.

Alley. A passage-way between the tiers of tanks in a magazine. (See MAGAZINE.) A passage-way affording means of access to the propeller-shaft.

Alliance. A league between two or more friendly powers, either offensive and defensive, or defensive only.

Alligator. The American crocodile.

Alligator Water. The muddy, brackish water near the mouth of tropical rivers.

Allision. Synonymous with *collision*, but is sometimes used to mark a distinction between one vessel running into another, and two vessels striking each the other.

Allotment. That part of the pay of a person on duty in a United States vessel which is paid during his absence to some person on shore. Allotments may be granted by any officer, or, with the approval of the commanding officer, by any man or petty officer in a vessel in commission. They are paid by navy pay agents to the allottees on the last day of every month, and the paymaster of the vessel at the same time deducts the amount of the allotment from the allottor's pay. The allottee must be a member of the allottor's family, or some person who receives the money for the benefit of said family. Allotments cannot exceed one-half the allottor's monthly pay. It is the duty of the paymaster having charge of the allottor's account to deduct as much from his pay as is paid on the allotment, and, in case of death, desertion, or discharge of the allottor, to give notice to the navy pay agent to cease payments to the allottee. The Fourth Auditor keeps a register of all allotments, the amounts paid to the allottees, and the amounts checked from the pay of the allottors. In case more is deducted from the pay of an allottor than is paid to the allottee, the difference will be paid to the former on application to the Fourth Auditor.

Allowance. Reimbursement of incidental expenses or losses incurred in the performance of duty; as, traveling allowance, allowance to paymasters for loss on clothing, small stores, etc. A gratuity or bounty; as, allowance of additional pay on re-enlistment. A commutation; as, allowance for the subsistence of pilots in officers' messes. A ration or fixed quantity of food. It is double, full, two-thirds, half, or short, according to circumstances. (*Commercial.*) A customary deduction from the gross weight of goods, varying in different countries.

Alloy. A combination of metals by fusion. The term is also applied to the metal that is mixed with gold or silver. The properties of the *alloy* are very different from the mean of the properties of the constituents, the *alloy* being harder, more tenacious, less ductile, fusing at a lower temperature, and more easily oxidized. Its density may be either greater or less than this mean, and its power of conducting electricity is less. If mercury enter into a combination, it is known as an *amalgam.*

Alluvion, or Alluvium. A deposit of earth, gravel, etc., along shores or banks, caused by the washing of the water, or by the precipitation of substances held in solution. Sea alluvions differ from those of rivers in that they form a slope *toward* the land.

Ally. A confederate. A prince or state united to another by treaty. See ALLIANCE.

Almacantars. Circles parallel to the horizon, and passing through every meridian.

ALMACANTARS STAFF. An old instrument of 15° of arc to observe the amplitude.

Almady. A canoe made of bark, used by the natives of Africa for war purposes. The name is also applied to a boat in use at Calcutta, often measuring from 80 to 100 feet in length, and generally from 6 to 7 feet in breadth.

Almafadas. Large dunnage cut on the coast of Portugal.

Almanac. A calendar of the days and months of the year, to which is generally added a record of the feast-days and celestial phenomena.

Almanac, The Nautical. As the astronomical ephemeris had its origin in the necessity for easy and accurate prediction of the phenomena and configurations of the heavenly bodies, so the nautical almanac originated in connection with the necessity for safe and speedy navigation. So soon as out of sight of land the navigator has but one sure means of information as to his position at sea; his compass gives him only the direction in which his ship lies or is sailing; he must rely upon the heavens alone for the precise determination of his position; and the problem of longitude and latitude is capable of solution only in connection with some *prediction* (a suitable period in advance) of the absolute positions of the bodies observed at the time when the observations are made upon them. This annual volume of such *predictions of the positions of the heavenly bodies as are necessary in the navigation of ships* constitutes the nautical almanac. In general, these predictions are given for equidistant intervals of time, so that by interpolation the position of a single body, or the relative position of two bodies, may be readily computed for any intermediate epoch. Long before the publication of the first nautical almanac, books of predictions, known as ephemerides, had been issued from time to time, at irregular intervals, mostly for the convenience of astronomers. It required simply a regulation and extension of the idea of these volumes to make up a nautical almanac. The nautical almanac proper had its origin with the English nation about the middle of the 18th century. It owes its existence to a memorial presented to the Commissioners of Longitude, on February 9, 1765, by Dr. Maskelyne, in which, after stating many facts and experiments to prove the utility of the lunar method of obtaining the longitude at sea, he concludes, that "nothing is wanting to make this method generally practicable at Sea but a Nautical Ephemeris." Dr. Maskelyne proposed the construction of such a "Nautical Ephemeris" from the "New and Correct Tables of the Motions of the Sun and Moon," by Tobias Mayer. The first volume issued was that for the year 1767. Gradually additions were made to the nautical almanac, and improvements introduced, mostly, however, in the direction of such predictions and ephemerides as were of more service to the astronomer than to the navigator, and the volume assumed the name of "The Nautical Almanac and Astronomical Ephemeris," which title it retains to the present day. The most important era in the history of the nautical almanac is marked by the "Report of the Committee of the Astronomical Society of London relative to the Improvement of the Nautical Almanac," adopted November 19, 1830. One very great improvement consisted in the abolition of the use of apparent time in all the computations of the nautical almanac, and the substitution of mean time therefor. (See EPHEMERIS, THE ASTRONOMICAL.) The entire almanac was remodeled by this committee; and the new arrangement of the several ephemerides therein contained has formed the basis of all subsequent nautical almanacs, and has remained unchanged in the "British Nautical Almanac" up to the latest volume,—that for the year 1883. "The American Nautical Almanac" had its origin nearly a century after the "British Nautical Almanac." On March 3, 1849, an act of Congress was approved providing for the preparation of such a work. The preparation of the first volume—that for the year 1855—was begun in the latter part of 1849, and the series of volumes is unbroken down to the present time, the volume for 1883 having just been issued. By act of Congress, "The meridian of the observatory at Washington shall be adopted and used as the American meridian for astronomical purposes, and the meridian of Greenwich shall be adopted for all nautical purposes." This law was the occasion of the subdivision of "The American Ephemeris and Nautical Almanac" into two distinct parts, and the publication of two separate volumes. Part the first is substantially identical with that portion of the "British Nautical Almanac" intended for the special use of navigators, and is likewise computed for the meridian of Greenwich. This part contains all the data necessary in the navigation of ships, and is published three years in advance of the year for which it is computed. "The American Nautical Almanac" likewise contains accounts of the transits of Mercury and Venus, and of eclipses of the sun and moon, with engraved diagrams of the solar eclipses. Each volume contains also an article on the arrangement and use of the various ephemerides, and a selection of subsidiary tables, of frequent use to the navigator.—*D. P. Tod.*

Almath. The star in Aries whence the first mansion of the moon takes its name.

Almeria. A city and port of Spain, in Andalusia, on the Mediterranean, 104 miles E. of Malaga. In the bay there is a good anchorage, in 12 and 14 fathoms. Pop. 30,000.

Almirante. (*Sp.*) Admiral.

Almury. The upright part of an astrolabe.

Almy, John J., Rear-Admiral U.S.N. Born in Rhode Island in the year 1815. Appointed from that state as midshipman, February 2, 1829; attached to the "Concord," Mediterranean, 1830–32; "Ontario," coast of Brazil, 1833–34; promoted to passed midshipman July 3, 1835; receiving-ship at New York, 1836–37; "Cyane," Mediterranean, 1838–41.

Commissioned as lieutenant, March 8, 1841; brig "Bainbridge," West Indies, 1842; frigate "Macedonian," coast of Africa, 1843–45; line-of-battle ship "Ohio," Gulf of Mexico and Pacific Ocean during the Mexican war and after the war, 1846–50; participated in the siege and capture of Vera Cruz and the capture of Tuspan; latter part of the war—1848—on the Pacific coast, and commanded one of the forts at Mazatlan during the naval occupation of that place; coast survey in 1851–56, on the survey of Chesapeake Bay and the sea-coast of Virginia and North Carolina; commanding "Fulton," on the coast of Central America, in 1857, when General Walker and his filibustering party surrendered to Rear-Admiral Paulding, on board of that vessel, at Nicaragua. Commanded the "Fulton" in the expedition to Paraguay in 1858–59; at navy-yard, New York, 1860–61.

Commissioned as commander, April 24, 1861; commanded "South Carolina," South Atlantic Squadron, 1862–63; "Connecticut," North At-

lantic Squadron, 1864; "Juniata," South Atlantic Squadron, 1865.

While in command of the "Connecticut," captured and sent in four noted blockade-running steamers with valuable cargoes; ran ashore and destroyed four others.

Commissioned as captain, March 3, 1865; commanded "Juniata" in a cruise to the South Atlantic (coast of Brazil and south coast of Africa), 1865-67. While on the coast of Brazil rescued the Brazilian brig "Americo" and crew from shipwreck, attended with great danger, for which service received the thanks of His Imperial Majesty the Emperor of Brazil. Ordnance duty at the navy-yard, New York, 1868-69.

Commissioned as commodore, December 30, 1869; chief signal-officer of the navy at Washington, 1870-72.

Commissioned as rear-admiral, August 24, 1873, and the following month took command of the United States naval forces in the Pacific Ocean. While at Panama, in October, 1873, a serious and violent revolution broke out, characteristic of that country, which continued for three weeks. The city of Panama and the Panama Railroad were in imminent danger of being destroyed. A force of seamen and marines numbering 200, under competent officers, was landed from the ships and kept on shore until the revolution terminated, affording efficient protection to the railroad, to American and to European interests. Two United States vessels, the flag-ship "Pensacola" and the "Benicia," were the only men-of-war in port. Passengers, freight, and specie continually passed over the road in safety and without interruption.

For these services Rear-Admiral Almy received the thanks of the Panama Railroad Company, the Pacific Mail Steamship Company, and of all the consuls and the foreign merchants at Panama.

Was in command of the United States naval forces in the Pacific for two years and ten months.

Has performed altogether twenty-seven years and ten months' sea service; shore, or other duty, fourteen years and eight months.

In April, 1877, was retired, having reached the age prescribed by law for retirement.

Alnus Caver. Early English transports, so called from the wood of which they were made.

Aloft. Overhead; on high; anywhere about the upper masts, yards, or rigging. See ALOW.

LAY ALOFT! The command to the men to run up to their stations.

ALOFT THERE! The hail to men on the yards and in the rigging.

ALOFT is used in a figurative sense for heaven.

Alonde. An old word for ashore; on land.

Along. Lengthwise.

ALONG OF. With.

LYING ALONG. Heeling over to leeward under a press of sail with a beam wind.

LYING ALONG THE LAND. Skirting the shore.

Alongshore. A nautical phrase signifying along the coast, or a course which is in sight of the shore. See 'LONGSHORE.

Alongst. In the middle of the stream, moored head and stern.

Aloof. At a distance.

Alow. Below. All sail *alow and aloft* is all plain sail and stun'-sails.

Alphabet Telegraph. An apparatus which marks symbols on paper, in contradistinction to those whose signals are made by a needle, mirror, or sound.

Alphard. The star *α Hydræ*.

Alpheratz. *α Andromedæ*.

Altair. *α Aquilæ*.

Altar. A step of a dry-dock.

Alternate. To happen or act by turns.

ALTERNATING WINDS. Blow for a time in one direction, and suddenly, from an alteration of the temperature, change and blow in the opposite directions. See MONSOON and BREEZE.

Altiscope. An instrument which enables an observer to look over an intervening object. This instrument has been applied, not very successfully, to pointing guns, the observer being on the deck below.

Altitude. Height. Angular distance of a heavenly body above the horizon measured on a great circle.

ALTITUDE, CIRCLES OF. Great circles of the celestial concave perpendicular to the horizon, and so called because "altitudes" are measured on them. They all pass through the poles of the horizon, of which the superior is the "vertex" of the visible heavens, and hence they are also called "*Vertical Circles*," or simply "*Verticals.*" In a polar system of horizon co-ordinates they are termed "*Circles of Azimuth*," as marking out all points that have the same "azimuth."

ALTITUDE, CIRCLES OF EQUAL. Circles on the earth's surface, from every point of each of which a given heavenly body is observed to have the same altitude at any given time. The circle of equal altitude is a great circle of the sphere when the body is in the horizon, or its altitude 0; the circle is reduced to a point when the body is in the zenith, or its altitude 90°; and between these two limits the parallels are small circles whose radii correspond to the complements of the altitude. A small arc of a circle of equal altitude, when projected on a Mercator's chart, will be approximately a straight line, especially if the altitude of the body be low. Such a line is called "*A Line of Equal Altitude.*" The determination of one or two such lines intersecting each other forms the basis of what is called "Sumner's Method" of finding a ship's position at sea.

ALTITUDE, CORRECTION IN. The total correction to be applied to the apparent altitude to deduce the true altitude. In the case of the stars, it is due solely to refraction, but for appreciably near bodies to the combined effects of refraction and parallax.

ALTITUDE, A DOUBLE. Two altitudes taken for the solution of the same problem. The ordinary problems for which the method furnishes the data are finding the latitude, and rating a chronometer. These altitudes may be of the same body, taken at different times, either both on the same side or on opposite sides of the meridian; or of different bodies similarly situated observed at the same time; or, lastly, of different bodies similarly situated observed at different times.

ALTITUDE, MERIDIAN. The altitude of a celestial body when on the meridian. In the case of a circumpolar star, whose whole diurnal circle is completed above the horizon, the body comes to the meridian twice, when its altitudes are spoken of respectively as "the Meridian Altitude below the Pole," and "the Meridian Altitude above the Pole"; the former is the lowest altitude the body

has in its revolution, the latter the highest. The meridian altitude is easily observed at sea with a sextant, and furnishes the simplest and most satisfactory method of determining the latitude, the declination of the body only being required in addition.

Altitude, Motion in. An instrument is said to move "in altitude" when it is turned on a horizontal axis; in contradistinction, it is said to move "in azimuth" when it is turned on a vertical axis. An azimuth and altitude instrument admits of both motions.

Altitude, Observed, Apparent, and True. The altitudes of heavenly bodies are observed from the deck of a ship at sea with the sextant. Such an altitude is called the "*Observed Altitude.*" There are certain instrumental and circumstantial sources of error by which this is affected: the sextant (supposed otherwise to be in adjustment) may have an index error; the eye of the observer being elevated above the surface of the sea, the horizon will appear to be depressed, and the consequent altitude in reality too great; and one of the limbs of the body may be observed instead of its centre. When the corrections for these errors and method of observing are applied—the "index correction," "correction for dip," and "semi-diameter"—the observed is reduced to the "*Apparent Altitude.*" But again, for the sake of comparison and computation, all observations must be transformed into what they would have been had the bodies been viewed through a uniform medium, and from one common centre,—the centre of the earth. The altitude supposed to be so taken is called the "*True Altitude*"; it may be deduced from the apparent altitude by applying the corrections called "correction for refraction" and "correction for parallax." "Correction for refraction": when a body is viewed through the atmosphere, refraction will cause the apparent to be greater than the true altitude; hence the correction for refraction is subtractive in finding the true from the apparent altitude. "Correction for parallax": the position of the observer on the surface, especially for near bodies, will cause the apparent to be less than the true altitude; hence the correction for parallax is additive in finding the true from the apparent altitude.

Altitude, Parallels of. Lesser circles of the celestial sphere parallel to the horizon. They mark all the points of the heavens which have the same altitude. The Arabic term for this system was "*Almacantars.*"

Altitude, Reduction of, to another Place of Observation. See Run.

Altitudes, Circummeridian. When the body is near the meridian, and altitudes are observed with a view of solving problems by first finding from these the meridian altitude, such altitudes are conveniently distinguished as *Circummeridian Altitudes.*

Altitudes, Equal. Double altitudes of the sun, when at the same altitude in the forenoon and afternoon.

Altitudes, Equation of Equal. In equal altitudes of the sun, its declination changes slightly in the interval between the forenoon and afternoon observation, and therefore the hour-angles corresponding to the two altitudes are not exactly equal. Hence half the interval added to the time of the first observation requires a correction in order to give the time shown by chronometer when the sun is on the meridian. This correction is called "The Equation of Equal Altitudes." It is given in tables.

Altitudes, Simultaneous. Double altitudes of different bodies taken at the same time.

Altometer. The theodolite.

Altona. A city and free port of Prussia, in Holstein, on the right bank of the Elbe, a little below Hamburg. It is accessible to sea-going vessels, and has a large trade. Pop. 90,000.

Aluffe, or Aloof. A very old form for *luff.*

Alveus. An ancient boat made of a single trunk; a dug-out.

Amadas (or Amidas), Philip, b. Hull, 1550; d. England, 1618. A commander of one of the vessels sent out by Sir Walter Raleigh, with Barlow, to take possession of lands on the eastern shore of America. He discovered Ocracoke Inlet, and landed on Wocoken Island, in Florida, subsequently exploring Pamlico and Albemarle Sounds and Roanoke Island. The title of admiral was conferred upon him, and he was united with Lane in the settlement of North Carolina, afterwards called Virginia.

Amain. With force or vigor; all at once; as, *lower amain.* An old word for *yield.* The lowering of the topsail was called *striking amain,* and it was demanded by the *wave amain,* or the brandishing of a sword.

Amalfi. A city and seaport of Italy, in the Gulf of Salerno, and 23 miles S.E. of Naples. Lat. 40° 38′ N.; lon. 14° 37′ 10″ E. A naval school is located at Amalfi. Pop. 6500.

Amalgam. A compound of mercury with another metal. See Alloy.

Amalphitan Code. The oldest code of modern sea laws, compiled during the first Crusade by the people of Amalfi, in Italy.

Amaye. Sea-marks on the French coast.

Ambassador. A diplomatic officer of the highest rank. A practical joke, in which the victim is unmercifully ducked.

Amber. A hard, resinous, vegetable substance, generally of a bright yellow color, and translucent.

Ambergris. A fragrant substance, the origin of which was long a matter of dispute. It is now known to be a morbid product developed in the intestines of the sperm whale. It is of a grayish color, very light, and fusible, and is used as a perfume and as a cordial.

Amelioration. An allowance made to the neutral purchaser, on reclaiming a ship improperly condemned, for the repairs she has undergone at his expense.

America. See Continents.

Americus Vespucci. See Vespucci.

Amidships. The middle part of a ship, whether in regard to her length or breadth, but more generally applied to the axis or fore-and-aft line.

Ammen, Daniel, Rear-Admiral U.S.N. Born in Ohio, May 15, 1820. Appointed midshipman, July 7, 1836; attached to the Exploring Expedition, 1837–38; sloop "Levant" and "Vandalia," in the West Indies, 1838–39; sloop "Preble," on the coast of Labrador and in the Mediterranean, 1840–41; returned to the United States on board ship-of-the-line "Ohio," 1841, and to Naval School; passed examination, June, 1842,

and received warrant of passed midshipman; store-ship "Lexington," as navigator, 1843–44, to the Mediterranean; sloop "Vincennes," as navigator, East India Squadron, 1845–47; coast survey, 1848–49.

Commissioned as lieutenant, November 4, 1849; frigate "St. Lawrence," Mediterranean Squadron, 1850; coast survey, 1851; attached to a commission for selecting a naval station in the Bay of San Francisco, Cal., 1852; scientific expedition of steamer "Water Witch," Paraguay River, 1853–54; brig "Bainbridge," Brazil Squadron, 1854–55; Naval Observatory, Washington, 1856–57; steam-sloop "Saranac," Pacific Squadron, 1858; steam-frigate "Merrimac," Pacific Squadron, 1859–60; steam-frigate "Roanoke," as executive-officer, North Atlantic Blockading Squadron, 1861; commanding "Seneca," South Atlantic Blockading Squadron, 1861–62, at battle of Port Royal, November 7, 1861; the day following hoisted our flag over Fort Beauregard, and made formal delivery to the army, by order of Rear-Admiral Du Pont; Tybee Island, December, 1861; commanded forces entering by way of Whale Branch in attack on Port Royal Ferry, January 1, 1862; engaged in the operations against Fernandina through St. Andrew's Sound and in St. John's River.

Promoted to commander, February 21, 1863; commanding monitor "Patapsco," South Atlantic Blockading Squadron, against Fort McAllister, March, 1863, and in the attack on Fort Sumter, April 7, 1863; had charge of a draft of 220 seamen on board of the California passenger steamer "Ocean Queen," May, 1864, bound to Aspinwall; two days after leaving New York suppressed an open and organized mutiny, with the assistance of Boatswain Thomas G. Bell, who was the only aid assigned, receiving in doing so the excellent co-operation of Captain Tinklepaugh,—who commanded the "Ocean Queen,"—his officers, and several of the passengers; commanding steam-sloop "Mohican," North Atlantic Blockading Squadron, 1864–65; in the bombardment of Fort Fisher, December, 1864, and again when it was carried by assault by the army, January, 1865; commanding ironclad "Miantonomah," special service, 1866.

Commissioned as captain, July 25, 1866; special duty, Hartford, Conn., 1866–67; commanding flag-ship "Piscataqua," Asiatic Squadron, 1867–68; Chief of Bureau of Yards and Docks, 1869–71.

Commissioned as commodore, 1872. Chief of Bureau of Navigation, 1871–78. Commissioned as rear-admiral, 1877; retired at his own request, 1878. July, 1878, appointed chairman of a board for the re-location of the Naval Observatory. April, 1879, ordered to attend the convocation at Paris, France, known as the Interoceanic Ship-Canal Congress. Had constructed on his design a cask "balsa," or life-boat, which is now at the navy-yard, Portsmouth, N. H., at which place are built life-boats on this design for all of our vessels of war. Total sea-service 21 years and 1 month; other duty, 17 years and 3 months.

Ammunition. In early times this word signified every description of warlike stores and provisions for attack or defense.

In modern usage its signification is limited to articles in use for charging fire-arms and ordnance of all kinds.

FIXED AMMUNITION. For guns of small calibre the charge and projectile are united for convenient transportation and rapidity in loading.

AMMUNITION BOXES. The boxes carried on the carriage of howitzers.

AMMUNITION CHESTS. Chests stowed in the tops for the convenience of the riflemen stationed there in action.

AMMUNITION-WIFE. A woman of doubtful character.

Amnesty. An act of oblivion or general pardon for all acts committed in time of war, or the proclamation of such pardon.

Amok. Slaughter. The practice, of Malays under the influence of *bang*, of running about the streets, attacking anybody and everybody.

TO RUN A-MUCK. To make an indiscriminate assault.

Amorce. (*Fr.*) Priming powder.

Amoy. A seaport town of China, on an island of the same name. Lat. 24° 10′ 3″ N.; lon. 118° 13′ 5″ E.; nearly opposite to the centre of the island of Formosa. The population, mostly employed in the coasting trade, is about 300,000.

Amperes. An ancient vessel in which the rowers pulled two oars each.

Amphibia. A class of animals which can live either in the water or on the land.

Amphiproræ. Ancient vessels, both ends of which were prow-shaped, so that in narrow channels they need not turn; the prototypes of the double-enders.

Amphiscii. The inhabitants of the torrid zone are thus denominated from their shadow being turned one part of the year to the north and the other to the south.

Amplitude. The angular distance of a heavenly body in the horizon from the east or west point. The *magnetic* amplitude is the angular distance of the body from the east or west point as indicated by the compass. The difference between the *true* and the *magnetic* amplitude is the variation of the compass.

At a given latitude the amplitude depends on the declination of the object. Amplitude is sometimes used to denote the horizontal distance to which a projectile is expelled from a gun, or what is more frequently called the *range*.

AMPLITUDE, OBSERVATION OF. The usual instructions for taking amplitudes are laid down with the view that the body shall be observed at the moment when its centre is really in the rational horizon. Thus the bearing of the sun is directed to be taken when its lower limb appears half-way between the horizon and its centre; the bearing of a star is to be taken at an altitude of 34′: the amplitude of the moon cannot be thus directly observed with accuracy, especially in high latitudes, by reason of her great depression by parallax, but may be found approximately by observing her bearing when her upper limb is in the horizon. In all cases, however, the better plan is to obtain by observation the bearing when the centre of the body appears on the horizon, and apply the necessary corrections (for dip, refraction, and parallax) taken from a table. For the sun, when rising, observe the bearing of the upper limb as it appears on the horizon, and continue to take the bearings of the centre, bi-

secting the sun's disk by keeping the upright wire on the upper limb until the lower limb appears. Read off each bearing. At sunset, when the lower limb touches the horizon, proceed in like manner until the upper limb disappears. The mean of the readings, reckoning from the east or west point, is the observed amplitude. When practicable, the moon may be observed in the same way. In the case of the sun and stars, a table (with latitude and declination for arguments) gives the necessary correction for refraction, to which the requisite dip is added. The same table applied in the *contrary* way gives the correction for the moon, which is the excess of the effect of parallax over the combined effects of refraction and dip. The amplitude of a star should be observed at *setting*, to admit of the body being easily identified.

Ampotis. The running out of the sea.

Amsterdam. An important commercial city, one of the capitals of the Netherlands, at the former confluence of the Amstel with the Y, a lake-like river, now mostly drained, but a small part remains and serves as a port for the city. It has a new artificial harbor on the North Sea, with which it is connected by a ship canal 15 miles long. Pop. 300,000.

Amulet. A charm worn by superstitious people as a preservative against disease or disaster.

Amusette. A shoulder-gun fitted with a swivel, carrying a ball weighing from half a pound to two pounds.

Anabus. A bony fish that has the power of living long out of water and moving considerable distances on land.

Anadromous. A term applied to migratory fishes.

Analemma. An orthographic projection of the sphere on the plane of the meridian. An instrument of brass or wood on which this projection is made. An old form of sun-dial.

Anan. An old word for "What did you say?" Also a corruption of *anon.*

Anas. A genus of water-birds of the order *Natatores*, now restricted to the typical ducks.

Anaumachion. Among the ancients the crime of refusing to serve in the fleet, the punishment for which was infamy.

Anchiromachus. A boat of the middle ages for transporting anchors and naval stores.

Anchor. A heavy iron instrument for retaining a ship in her place. It is attached to the ship by a rope or chain, and is thrown overboard from the bows.

The earlier anchors were made of wood with an arm, and later two arms. Stones were attached to give weight to sink and greater holding power. With all the improvements of modern times, the anchors now in use have undergone but little change of form.

After the wooden anchor followed the iron anchor with a wooden stock. At the present day all navy anchors are fitted with iron stocks.

Anchors are *solid* when the shank and arms are welded together. In most *patent* anchors the arms are movable and capable of being separated from the shank.

The *solid* or common anchor consists of the *shank*, the *ring* (*shackle*, or *Jew's-harp*), the *arms*, and the *stock.*

The *shank* is the main body of the anchor. The *ring* is bolted to the upper end and the *arms* are welded to the other. The *crown* is the heavy end of the shank to which the arms are welded. It is the part which first strikes the ground when the anchor is let go perpendicularly.

The *stock* is the iron beam at right angles to the shank. It has a shoulder near its middle part, and when this shoulder is snug up against the shank it is keyed on the other side. The end opposite to the shoulder is bent for convenience in stowage.

On the ends of the stock are cast-iron balls, the one on the bent end being movable and the other riveted.

The *arm* consists of the *palm* (or *fluke*), the *bill* (*point*, or *pee*), and the *blade.* The *palm* is shaped much like a shield, and is welded and riveted to the *blade.* The *bill* is the part of the arm which projects beyond the palm. The *ring* is that part of the anchor to which the cable is bent.

The essential properties of an anchor are *strength*, *holding*, *quick-holding*, *canting*, *facility of sweeping*, *of stowing*, *and of transport in boats*, *exemption from fouling*, and *quick-tripping.* Of these the most important are *strength*, *holding*, and *quick-holding.*

These qualities depend upon the weight of metal, size and shape of the cross-section of arms and shank, length of arms, shank, and stock, angle at which the arms are set on, size and shape of palm, finish of the bill, curvature of the arm, quality of the material, and the workmanship.

The development of one of these qualities to an extreme degree may involve the sacrifice of another. For instance, the Trotman anchor is notably *exempt from fouling*, as the upper fluke lies down against the shank, but this peculiarity renders it almost impossible to pick it up by *sweeping* for it. An anchor that *holds* well does not *trip* quickly. The holding power of an anchor depends a great deal on the length of the arm; but a long arm is an element of weakness. So there is much to be considered in the form and dimensions of anchors, and it has required a great many experiments to determine them. The American Anchor, designed by Mr. James Brown, master-smith at the Washington Navy-Yard, fulfills all required conditions.

Anchors for the navy are forged under the steam-hammer from scrap-iron, and are gotten out in five parts, viz.: the shank, two arms, stock, and shackle (or ring).

The scrap-iron is first hammered into blooms, the most convenient size being 36 inches long, 10 inches wide, and 4 inches thick. The blooms being in readiness, the parts of the anchor are forged and put together in the following order:

The *shank.* The blooms are piled on the end of a porter bar, heated and welded under a steam-hammer until the mass of iron on the end of the bar is of sufficient size to make the shank. The building-up process begins at the crown, and the mass is gradually drawn out towards the ring end, and swaged smooth under the hammer. The holes are punched for the ring and stock, and the shank is then cut off from the bar.

The two arms are forged separately, also the two palms. The palms are welded on to the arms and riveted, and the bill is drawn out and finished up. The shank is then heated at the crown end, scarfed on one side, and the arm welded

on; then scarfed on the other side and the second arm welded on. The arms are welded on straight, and afterwards heated and bent to the proper angle.

The *stock* is forged from blooms in the same manner as the shank. The ring is forged straight, and afterwards heated and bent to the proper shape and a bolt fitted to the eyes.

The process of annealing anchors has now generally gone out of use.

The following are the proportions of a 6000-pound anchor:

Shank.—Length, 13 feet 8 inches; cross-section at the largest part where the arms are welded on, 10½ by 8½ inches; cross-section at the stock, 8½ by 7 inches, the greatest dimension being in the plane of the arms.

Stock.—The length is equal to the length of the shank over all, and in diameter it is about two-thirds the smallest width of the shank measured in the plane of the arms.

The length of the arm is nearly one-third the length of the shank, and in bending them an equilateral triangle is formed with the length of the arm for one side, the same distance laid off on the shank from the crotch for the second side, and the distance from the end of this line to the bill completes the triangle.

In forging anchors a great deal is done by eye for shape and proportions. The crown and throat are rounded off, and the shank has eight faces, with a straight taper from the crotch to the stock. The weight of an anchor is inclusive of the ring and exclusive of the stock, which is about one-fourth the weight of the anchor.—*C. T. Hutchins*, *Lieutenant U.S.N.*

PATENT ANCHORS. Many designs have been submitted, the most prominent of which are mentioned below. The oxidation of the movable parts of portable anchors is the great source of failure, as they require constant care and attention to keep them in working order.

Isaac's Anchor has a bar of iron from each end of the stock to the middle of the shank, and the palms are connected by a flat elliptical bar of iron. It has great strength, and is notably exempt from fouling, but is deficient in other respects.

Latham's Anchor has an arm provided with three flukes, and the shank is made of two pieces, which separate at the crown end to allow the midship fluke to pass. When the three flukes enter the ground, the flange on the crown-piece takes on the shank and the arms are held rigid. No stock is required.

Marshall's Anchor. The arms are straight and move independently on a pivot, which passes through the crown. The arms are fitted with projections, which assist the flukes to enter the ground.

Martin's Anchor is supplied to the turret-ships of the British navy. The anchor is very compact, and for that reason is especially recommended to rams and turret-ships, as it does not impede the fire nor project from the bows.

Morgan's Anchor has a curved bar of iron, which passes through a slot in the shank and connects the two arms to each other. The arms are separately pivoted to the shank. When one fluke enters the ground the other is drawn down against the shank, the connecting bar serving to strengthen the arms.

Porter's Anchor is the same in principle as Trotman's, which see.

Rodger's Anchor has a shank with a wooden core, the object being to give greater strength with a given weight of metal. He also designed the *pick-ax* anchor, an anchor without palms.

Trotman's Anchor. The oscillatory system is the principal feature of this anchor. The arms are in one piece and work in a slot in the shank. When one fluke enters the ground the other is drawn down against the shank. The backs of the arms are fitted with horns to assist the flukes to enter the ground. It is one of the best of the patent anchors.

The BOWER-ANCHORS are so named from their being carried on the bows. In early days they were of different sizes; the larger one, called the *best* bower, was carried on the starboard bow, the other was known as the *small* bower. These designations are yet retained, though the anchors are now of equal size.

The WAIST- or SHEET-ANCHORS are equal in weight to the bower-anchors, and are carried on the side, abaft the fore-rigging. They are secured with the stock perpendicular, and the shank resting on two shores.

The SPARE-ANCHOR, when no sheets are carried, is of the same size as a bower-anchor, and is stowed inboard.

The STREAM-ANCHOR is one-fourth the weight of the bower-anchor, and is carried inboard.

KEDGES are small anchors, from one-sixth to one-fourteenth the weight of the bower. They are stowed in the chains.

BOAT-ANCHORS are small anchors supplied for the use of the boats. They are stowed in the hold of the ship until needed for service.

With reference to their position anchors are termed *flood*, *ebb*, *weather*, *lee*, *sea*, or *shore anchors*.

TO SHOE AN ANCHOR. To fit triangular pieces of wood to the palms to give greater holding power.

TO COCKBILL THE ANCHOR. To ease off the shank-painter, and hang the anchor by the ring-stopper.

TO LET GO THE ANCHOR. To release it from the cat-head that it may fall to the bottom and hold the ship.

TO DRAG THE ANCHOR. To trail it over the bottom by force of the wind or current.

TO BACK THE ANCHOR. To increase the holding power of an anchor by planting a smaller one ahead of it, and connecting the two with a chain. The holding power of an anchor may be increased by attaching a weight to the bight of the chain, thus bringing the strain lower down, and causing the fluke to *bite* harder.

TO TRIP THE ANCHOR. To heave it clear of the bottom.

TO SIGHT THE ANCHOR. To heave it up to the surface of the water.

TO WEIGH AN ANCHOR. To heave it up to the bows.

TO CAT THE ANCHOR. To hoist it up to the cat-head and pass the ring-stopper.

TO FISH THE ANCHOR. To hoist the flukes up to the bill-board and pass the shank-painter.

TO STOW AN ANCHOR. To secure it in its proper place.

TO TRANSPORT AN ANCHOR. To shift it from one position to another in the ship.

To Secure the Anchor for Sea. To ring it up close to the cat-head, and get the inner fluke inboard, and pass extra lashings.

To Get the Anchor Off the Bows. To take off the extra lashings, and heave the inner fluke up and outboard, so it will slip off the bill-board when the shank-painter is let go.

To Sweep, Drag, or Creep for an Anchor. To endeavor to pick up an anchor or the chain by trailing for it with a grapnel or the bight of a rope.

Foul-anchor. The condition of an anchor when the chain has taken a turn around the flukes, shank, or stock, or when the anchor has caught into some other anchor, chain, or wreck.

The anchor is *aweigh* or *atrip* the moment it is disengaged from the ground. It is *apeak* when the chain is up-and-down. It *comes home* when it is trailed over the bottom as the ship drifts.

Anchor, Drag-, or Floating-. See Sea-anchor.

Anchor, Jury. A temporary anchor constructed to supply the place of one which has been lost. Ships are sometimes obliged to resort to their guns, boilers, and other heavy articles.

Anchor, Mushroom. Has a head shaped like a bowl, and no stock is required. It is used for moorings.

Anchor, Screw. Large screws with broad flanges, used for moorings and to shoe piles.

Anchor, Sea. A species of raft or drag formed of spars and canvas to keep a ship's head to the wind and to decrease her drift. It is attached to the ship by a hawser, and is generally fitted with a buoy and an anchor.

Anchorage. A duty levied upon vessels upon coming to a port for the use of its advantages. The set of anchors belonging to a ship. A place suitable for anchoring. It is marked on charts by an anchor, and is described according to its attributes as good, snug, open, or exposed.

Anchor-ball. A pyrotechnical combustible attached to a grapnel.

Anchor-bar. A large handspike to pry the anchor off the bill-board.

Anchor-chock. Pieces let into an anchor-stock. Pieces of wood or iron upon which an anchor rests when it is stowed.

Anchor-hold. The fastness of the flukes in the ground.

Anchor-hoops. Heavy iron hoops binding a wooden stock to the shank and over the nuts of the anchor.

Anchor-ice. The ice which forms on and incrustates the beds of lakes and rivers.

Anchoring. (*p. pr. of v. t.* to anchor.) (Lat. *ancora*, anchor.) The manœuvre by which a vessel is brought to anchor, *i.e.* brought to a state of temporary rest and security by means of an anchor let go from the vessel.

The anchor, attaching itself to the bottom, is enabled by means of the intervening cable to hold the vessel in place. A vessel may be brought to anchor under a great variety of conditions of wind, tide, and sea.

The peculiar nature of the anchorage itself, and the number of vessels occupying it, must also be considered. For the minor details of all that precede, accompany, and follow this manœuvre, the reader is referred to works on *Seamanship*. The principal points to be observed are, *First*, that on approaching the anchorage both bower anchors (see Anchor) and their cables should be in readiness for use, always having the second anchor ready to let go in case the first, from any cause, should fail. *Second*, that the vessel should be head to tide, or nearly so, when the anchor is let go. *Third*, on approaching the anchorage, under favorable circumstances, the speed of the vessel should be gradually reduced, then stopped, and finally a stern-board be given her, either by the action of the wind or tide, or by the use of sails or engine. The moment of starting astern is that for letting go the anchor. *Fourth*, that the vessel should have sufficient stern-board to lay her cable out clear and straight from the anchor. *Fifth*, that the stern-board should not be so great as to endanger running out too much cable, or of parting in attempting to check it. *Sixth*, that when the cable is finally secured there should be a good scope out. *Seventh*, that when anchored the vessel should be in a good berth.

It is generally conceded that a vessel should never ride to a shorter scope of cable than six times the depth of water. That is to say, if anchored in ten fathoms of water she should not have out less than sixty fathoms of cable for ordinary security. In general, there are three different classes of vessels that may be treated of under this head: the square-rigged sailing-vessel, the *fore-and-after*, and the steamer. To bring one of the former into a crowded harbor, to pick out a good berth and come to anchor in a proper manner, calls forth all the skill and judgment of a practical seaman, and an amount of knowledge which can be obtained only by long and varied experience.

With a schooner we have, ordinarily, only to haul down the head-sails, luff up into the wind, and when the headway is lost and she begins to go astern, to drop the anchor, and then to pay out the necessary scope as she takes it. Or beating in with a strong windward tide (see Tides), we should reverse the operation; lower the fore and mainsails, wear around under the jib, and, when head to tide, let go the anchor.

With a steamer the operation is still more simple. Steering directly for her berth, the engines are first "slowed," then stopped, and finally backed, if necessary; when the headway ceases the anchor is let go and the cable paid out as she takes it. If she had been steaming in against the tide she will, on stopping the engines, soon go astern and take her cable. If she has the tide with her, as soon as the anchor touches the bottom she will begin to swing to the tide. When head-to, pay out to the necessary scope.

Anchoring by the Stern is to have the cable brought in through a stern-chock, so that when the anchor is let go from the bow the vessel will ride by the stern.

Anchoring with a Spring: to attach a hawser to the ring of the anchor before letting go, so that when the anchor is down and an equal strain brought upon the cable and the hawser, the vessel will ride to a bridle, presenting her broadside to the wind or tide as either may prevail. The vessel's head may be then made to change direction by shortening in, or veering on the cable or hawser, as desired.

The two last manœuvres are practiced in war: the former when it is undesirable to swing around, as when anchoring in the ordinary way; the latter when it is desired to change the ship's

head in certain directions so as to bring the batteries to bear on the enemy.

Anchoring in very deep water (as a temporary expedient) may be done by means of the stream-anchor (see ANCHOR) and a hawser.—*S. B. Luce, Captain U.S.N.*

Anchor-lining. Short pieces of plank fastened to the ship's side, under the fore-channels, to prevent the anchor from bruising the side

Anchor-ring. The ring to which the cable is bent. Now generally a shackle, or Jew's-harp.

Anchor-seat. An old term for the prow.

Anchor-shackle. The shackle in the end of the shank. The ring.

Anchorsmith. A forger of anchors.

Anchor-stock. A beam of wood or iron, secured to the shank at right angles to the flukes.

Anchor-stock-fashion. The method of placing the butt of one plank nearly over the middle of another; the planks being broadest in the middle and tapering to the ends resemble an anchor-stock.

Anchor-stocking. A method of securing and working planks with tapered butts.

Anchor-watch. A small number of men kept on duty at night, while the ship is in port, to be in readiness to do any duty that may be required, especially to let go an anchor, veer cable, hoist head-sails, set spanker, or to man a boat.

Anchovy. A fish of the family *Clupiedæ*, caught in large numbers in the Mediterranean, and pickled for exportation.

Ancon. The angle of a knee-timber.

ANCON. (*Sp.*) Harbor, bay, anchorage.

Anderson, Culjohn. A Swede. He made two journeys into the interior of Africa in exploration of the source of the Niger. He reached Lake Ngami, in the S.W. of the continent, and published a work on the Okevengo River.

Andromeda. A northern constellation behind Pegasus, Cassiopeia, and Perseus, representing the figure of a woman chained. *a Andromedæ*, Alpheratz.

Anemometer. An instrument for measuring the force and velocity of the wind. They are of various forms, and indicate the force directly, as against a plate compressing a spring, or the velocity, as by a revolution of a wheel carrying vanes or hemispherical cups. They are often self-registering.

Anemoscope. A vane-index with pointers to show the change of the wind without referring to the vane.

An-end. The position of a spar when erected perpendicularly. The topmasts are *an-end* when they are fidded.

To STRIKE A PLANK AN-END is to drive it in the direction of its length.

Anent, or Anenst. Opposite to; over against.

Aneroid Barometer. See BAROMETER.

Angel-fish. The *Squatina angelus*, of the shark family. It is six or eight feet long, with a rough back and smooth white belly.

Angel-head. The barb of an arrow; probably *angle-head.*

Angel-shot. A projectile composed of two hollow half balls connected by a chain, which is inclosed in their cavity when they are brought together; a kind of chain-shot.

Angil. An old term for a fishing-hook, and also for the red worm used for bait.

Angle. A corner. The difference in direction of two lines in the same plane, proceeding from the same point.

A SPHERICAL ANGLE is formed by the intersection of two great circles. It is the inclination of the planes of these circles to each other.

A SOLID ANGLE is formed by the meeting of three planes at one point. See ELEVATION, FIRE, SIGHT, MAST-HEAD, LEEWAY.

Angon. A half-pike or javelin.

Angosiade. An astronomical falsehood; a term originating from the pretended observations of D'Angos at Malta.

Angra. (*Sp.*) Bay or inlet.

Anguilliform. Having the appearance of eels.

Angular Crab. An ugly long-armed crustacean, with eyes on remarkably long stalks.

Anilla. A commercial term for indigo.

Animal Flowers. Actiniæ, or sea-anemones and similar animals project a circle of tentacula resembling flowers. They were formerly all classed under *Zoöphytes.*

Animate. To give power or encouragement.

To ANIMATE A NEEDLE. To magnetize it.

To ANIMATE A BATTERY. To put the guns in position.

Anker. A Dutch measure containing ten wine gallons.

ANKER-FISH. A kind of cuttle-fish.

Ankle-bone. A sailor's name for the crawfish.

Anna. In the East Indies, the 16th part of a rupee, about three cents in United States currency.

Annapolis. A city and port of entry in Maryland, on the S.W. bank of the Severn River, 3 miles from its entrance into the Chesapeake Bay, 30 S. by E. from Baltimore. Lat. 38° 58′ 50″ N.; lon. 76° 30′ W. The United States Naval Academy is here located. Pop. about 6000.

Annealing. There are many substances which, when rapidly cooled after having been heated, become exceedingly brittle; this result may be prevented by very slow cooling, which process is termed *annealing*. By this process the substance is rendered softer and less brittle, but its elasticity is impaired.

Annet. A kind of gull.

Annex. A term used on the Mississippi and other Western rivers to indicate the pilot-house of steamboats, called also "Texas." The term is said to have originated about the time of the annexation of Texas to the United States.

Annihilator, Fire. See FIRE-EXTINGUISHER.

Anniversary Winds. Those which blow constantly at a certain season of the year; as, monsoon and etesian winds.

Annotinæ. The ancient Roman provision vessels.

Annual. Yearly.

ANNUAL ACCOUNTS. The ship's books and papers for the year.

ANNUAL VARIATION. The yearly change in the variation of the compass. The change produced in the right ascension or declination of a star by the precession of the equinoxes and the proper motion of the star taken together.

Annul. To revoke; to rescind.

Annular. Resembling a ring.

AN ANNULAR ECLIPSE takes place when the apparent diameter of the moon is less than that of

the sun, and a ring of light surrounds the moon while central.

Annular Scupper. A scupper in which the hole may be enlarged or diminished by a movable concentric ring.

Annulling Signal. A signal which denotes that the previous signal is void.

Annulus Astronomicus. A ring of brass used formerly in navigation.

Anode. The positive pole of an electric battery; or, more strictly, the *path* by which the current passes out and enters the electrolyte on its way to the other pole; opposed to *cathode.*

Anomalistic Revolution or Period. The period during which a planet makes a complete revolution from any point in its orbit back again.

Anomalistic Year, or Periodical Year. The time in which the earth makes its anomalistic revolution, which is longer than the tropical year on account of the precession of the equinoxes.

Anomaly. Deviation from established rules.

Anomoural. Irregular in the character of the tail or abdomen; as, the *anomoural crustaceans,* a group between the crabs and the shrimps.

Anon. Quickly; immediately. At another time.

Anonymous Partnerships. Those not carried on under a special name, and the particulars of which are known only to the parties themselves.

Ansæ. The handles of old ordnance. The projections of Saturn's rings in certain situations.

Anser. A Linnæan order of natatorial birds swimming by means of web-feet, as the duck, or of lobe-feet, as the grebe.

Anson, George, Lord. An English admiral; born in Staffordshire, England, in 1697; entered the navy at an early age, and in 1724 was made post-captain. He was soon ordered to the Carolina station, where he purchased land and built a town called after his own name. He was subsequently appointed to the command of the South Sea Expedition which sailed from England in 1740. After his return, in 1744, he was successively created rear-admiral of the blue, commissioner of the admiralty, and vice-admiral. In 1747 he commanded the Channel Fleet, and captured six French ships of war. As a reward for this brilliant exploit he was created a peer, with the title of Lord Anson, Baron of Soberton. He was First Commissioner of the Admiralty from 1751 to 1756. In 1757 Anson was made admiral, and in the same year was placed at the head of the admiralty. Died in 1762. No book in the English language possesses a greater charm for youth and the lover of adventure than "Anson's Voyage."

Answer. To reply. To suit; as, this boat will not *answer.*

Answer the Helm. A ship is said to answer the helm when she obeys it readily.

Answering Pennant. A pennant which is hoisted to indicate that a signal has been read and understood.

Antarctic. Relating to the South Pole or to the region near it.

Antarctic Circle. A parallel 23° 28′ from the South Pole.

Antarctic Pole. The South Pole.

Antarctic Ocean. The portion of the ocean included within the Antarctic Circle.

Antares. A star of the first magnitude, popularly known as the *Scorpion's heart* (*a Scorpionis*).

Antecians. Those inhabitants of the earth who live on the same meridian, but in opposite hemispheres.

Antelucan. Before daybreak.

Ante-meridian. Before noon.

Anthelion. A luminous appearance on a cloud, over against or opposite to the sun. It consists of a circular ring or rings around the shadow of the spectator's own head as projected on a cloud or on some opposite fog-bank.

Anthracite. See Coal.

Anticthones. Inhabitants of countries diametrically opposite to each other.

Anti-friction Composition. See Friction.

Anti-friction Metals. See Friction.

Anti-gallicians. Extra backstays sometimes used by merchant vessels running before the trades.

Anti-guggler. A straw or tube introduced into a bottle or cask to suck out the contents.

Anti-parallels. Lines which make equal angles with two other lines but contrary ways.

Antipathes. A kind of coral having a black, horny stem.

Antipodes. The inhabitants of the earth diametrically opposite to each other. The term is now applied to the countries which are at the opposite ends of any diameter of the earth.

Antiscii. The people who dwell in opposite hemispheres, and whose shadows at noon fall in contrary directions.

Antiscorbutic. Opposed to, or counteracting scurvy. See Scurvy.

Antiseptic. Opposed to, or counteracting putrefaction, or tendency to putrefaction, in the system.

Antlia. A constellation known as the *Air-Pump.*

Antwerp. A city of Belgium, on the right bank of the Scheldt. Lat. 51° 13′ 2′ N.; lon. 4° 24′ 2″ E. It is strongly fortified, the walls and other defenses completely incompassing the city on the land-side, having more than 12 miles of solid ramparts. Of the stocks, dock-yard, and basins, constructed by Napoleon at an expense of $10,000,000, the last only remain. The harbor is one of the finest in the world; it admits vessels of any size, and can easily hold 1000. Pop. 150,000.

Anvil. The massive block of iron on which shipsmiths hammer forge-work. A streamer at the end of a lance.

Any Port in a Storm. A phrase signifying contentment with one's lot. The best practicable way out of a difficulty.

Ape, or Sea-Ape. The long-tailed shark. An active American seal.

Apeak. Near the perpendicular. An anchor is *apeak* when the chain is up-and-down. The oars are *apeak* when the blades are thrown forward and the crew is waiting for the order to "give way" in racing. With an awning spread in a boat it is impossible to "up oars." When they are raised as high as the awning permits they are said to be *apeak.*

Apertæ. Ancient deep-waisted ships with high-decked forecastle and poop.

Aperture. The clear diameter of the object-glass of optical instruments.

Apex. The summit or vertex.

Aphelion. The point in a planet's orbit which is at the greatest distance from the sun.

Aphellan. Castor. *a Geminorum.*

Aphracti. Ancient vessels with open waists.

Aplanatic. Having two or more lenses of different curvatures so combined that their respective aberrations neutralize each other, and the resulting compound lens is free from spherical aberration.

Aplets. Nets for the herring fishery.

Aplustre. An old word for the ornament at the bow and for the ensign at the stern.

Aplysia. A sea-hare of the genus of mollusks of the order *Tectibranchiata.* Some of the species have the power of throwing out a deep purple liquor, which colors the water for a considerable distance and serves to conceal the animal.

Apobathræ. Ancient gang-boards from the ship to the wharf.

Apogee. That point of the moon's orbit which is at the greatest distance from the earth. Formerly, on the supposition that the earth was the centre of the system, this name was given to the point in the orbit of the sun, or of a planet, which was at the greatest distance from the earth.

A-poise. Balanced; properly trimmed.

Apostle. A knight-head or bollard timber. A paper sent up on appeals in the admiralty courts.

Apothecary. The chief assistant of the medical officer. He is appointed by the surgeon for the cruise. Familiarly known as "Pills."

Appalachicola. A port of entry of Florida, on the Gulf of Mexico, at the mouth of the Appalachicola River. Pop. 1200.

Apparatus. Ammunition and equipage for war.

Apparel. In marine insurance, the furniture of a ship; as, masts, sails, ground-tackle, guns, etc. It is a more comprehensive term than *apparatus.*

Appareled. Fully equipped.

Apparent. (Lat. *apparere*, to appear.) An adjective indicating that which appears to the senses—phenomenal.

"*Apparent*" is sometimes equivalent to *true* or *real*, when contrasted with *fictitious* or *imaginary.* Thus the "apparent sun" is the *true* sun we see, as opposed to the *imaginary* "mean sun"; "apparent time" is reckoned by the hour-angles of the same sensible body opposed to "mean time," which is defined by the movement of the fictitious mean sun; "apparent noon" is when the true sun is on the meridian, and is distinguished from the "mean noon," which is marked by the transit of the mean sun.

"*Apparent*" is sometimes used as a qualification, distinguishing on the one hand from *observed*, and on the other from *true.* It is in this sense applied to elements corrected for instrumental and circumstantial sources of error, but not yet reduced to the common standard for comparison and computation. We thus have the "apparent altitude" of a heavenly body, and the "apparent distance" of two heavenly bodies, distinguished on the one hand from the "observed," and on the other from the "true" altitude and distance. So also there is the "apparent place" of a heavenly body in the celestial concave, and the "true place."

"*Apparent*" is sometimes opposed to *proper*, to distinguish the phenomenal diurnal motion of the heavenly bodies resulting from the earth's rotation on her axis, from that which is due to the annual revolution of the earth in her orbit, and to the motion of each body in its orbit.

Apparition. The first appearance of a star after occultation.

CIRCLE OF PERPETUAL APPARITION. A circle whose distance from the elevated pole is equal to the latitude of the place of observation. Within this circle the stars never set.

Appearance. The first making of a land-fall; formerly astronomically used for *phenomenon* and *phase.*

Appendages. The valves, gauges, etc., of a boiler. The comparatively small portions outside the main body of the ship; as the keel, rudder, etc. Their volume is computed separately and added to the main calculation to determine the displacement of a ship.

Apple-pie-order. In excellent condition; neat and trim.

Appoint. To assign or designate by authority.

APPOINTED OFFICERS are petty officers shipped for the cruise for special service, and not entitled to continuous-service certificates; as, master-at-arms, yeomen, etc.

An *acting appointment* may be issued by the commander-in-chief when a permanent vacancy occurs which cannot be filled from the supernumerary officers of other ships. This appointment must be in writing, and subject to revocation by himself, his successor, and the Secretary of the Navy. An officer holding an *acting appointment* wears the uniform of the grade to which he is appointed, and annexes his acting rank to his official signature.

Appointments. The various details constituting the equipment of a vessel, or the accoutrements of an officer or enlisted man.

Apportionment. The act of apportioning; a dividing into just proportions or shares; as, in the distribution of prize-money.

Appraisement. A valuation. A law instrument taken out by the captors of a vessel.

Apprehend. To seize a person with a view to punishment.

Apprentice. See NAVAL APPRENTICE.

Appropriation. A sum of money set apart by Congress for a particular purpose.

Approve. To sanction officially.

Appulse. The near approach of one heavenly body to another, so as to form an apparent contact.

Apron. A timber conforming to the shape of the stem, and fixed in the concave part of it, extending from the head to some distance below the scarf, joining the upper and lower stem-pieces.

APRON OF A DOCK. The platform on which the sill is fastened down.

APRON OF A GUN. The metal cover for the lock and vent.

Apsides, Line of. The right line joining the aphelion and perihelion points of the orbit of a planet. The term is also applied to the line joining the perigee and apogee of the moon.

Apsis. Each extremity of the line of apsides.

Apus. A constellation known as the *Bird of Paradise.*

Aquarius. The Water-carrier, the eleventh sign in the zodiac, which the sun enters about

the 21st of January; so called from the rains which prevail at that season in Italy and the East.

Aquatic. Inhabiting or relating to the water.

Aquatites. The law-term for everything living in the water.

Aque. Wall-sided, flat-floored boats, which navigate the Rhine.

Aqueduct. A conduit or canal built for the conveyance of water.

Aquila. The Eagle; a constellation in which is a very bright star (*Altair*) much used by navigators in taking observations.

Aquilon. The northeast wind.

Ara. The Altar; a southern constellation, containing nine stars.

Aramech. The Arabic name for the star Arcturus.

Arbalist. An engine to throw stones, or the cross-bow used for darts and arrows. Formerly *arbalisters* formed part of the naval force.

Arbiter. The judge to whom a matter is referred for adjustment.

Arbitrage. The referring of commercial disputes to two or more disinterested persons.

Arbitration. The settlement of disputes out of court.

Arbor. A spindle or axis.

Arby. The thrift, or sea-lavender.

Arc. A part of a circle.

Diurnal Arc. That part of a circle, parallel to the equator, which a heavenly body describes from its rising to its setting. *The nocturnal arc* is the arc described by the body from its setting to its rising.

The Arc of Direction or Progression is the arc which a planet appears to describe when its motion is direct in the order of the signs.

Arc of Vision. The sun's depth below the horizon when the stars begin to appear.

Archangel. A town of Russia, on the Dwina, 20 miles from its embouchure in the Bay of Archangel. Lat. 64° 32′ N.; lon. 40° 33′ E. This is one of the oldest ports in Russia, having been founded in 1584, and was long the only one. Pop. 20,000.

Arch-board. The part of the stern over the counter, immediately under the knuckle of the stern-timbers.

Arched Squall. See Squall.

Archel, Archil, or Orchil. A lichen found on the rocks of the Canary and Cape de Verde Islands. Litmus is obtained from it.

Arches. A term among seamen for the Archipelago. See Galley-arches.

Archi-gubernus. The commander of the imperial ship in olden times.

Archimedes' Screw. An ingenious spiral pump invented by Archimedes B.C. 260. It is also used for removing grain from a lower to a higher level. The name is applied also to the screw-propeller.

Arching. The drooping of the extremities of a vessel. See Hogging.

Archipelago. Originally the Ægean Sea. A body of water interspersed with many islands.

Architecture. See Naval Architecture.

Archives. Public records and papers, which are preserved as evidence of facts.

Arch of the Cove. An elliptical moulding sprung over the cove of the ship, at the lower part of the taffrail.

Arctic. Northern, or lying under *Arktos*, the Bear.

Arctic Pole. The north pole of the globe.

Arctic Ocean. The expanse of water within the Arctic Circle.

Arctic Circle. A parallel distant 23° 28′ from the north pole. It divides the north frigid from the north temperate zone.

Arcturus. A star of the first magnitude close to the knee of Boötes. *a Boötis.*

Ardent. Said of a ship when she has a tendency to come to the wind, and keeps a strain on the weather tiller-rope.

Ardent Spirits. Distilled liquors. They are not permitted to be on board a man-of-war except as medicinal stores.

Arenaceous. Brittle; sandy; partaking of the qualities of sand.

Arenal. In meteorology, applied to a cloud of dust so thick as to prevent seeing a stone's-throw off, common in South America, being raised by the wind from adjoining shores.

Arenation. The burying of scorbutic patients up to their neck in sand; spreading hot sand over a diseased person.

Arendal. A seaport town of Norway, 36 miles N.E. of Christiansand, on the Skager-Rack, at the mouth of the Nid-Elv. It has a custom-house and yards for ship-building. Pop. 5800.

Areometer. An instrument for measuring the specific gravity of fluids; a hydrometer.

Argin. An old word for embankment.

Argo. The name of the ship which carried Jason and his companions on their romantic expedition to Colchis in quest of the golden fleece.

Argol. The lees of wine adhering to the cask; supertartrate of potassa.

Argonauta. The paper-nautilus. The sail which it spreads is a modified arm, which invests the outer surface of the shell.

Argonauts. The company that sailed in the "Argo." A geographical society instituted at Venice, to which we are indebted for the charts and maps of Coronelli. In the United States, the men who first emigrated to California on the discovery of gold in 1849 are sometimes styled Argonauts.

Argo Navis. The constellation of the Ship, containing 9 clusters, 3 nebulæ, 540 single and 13 double stars, of which 64 are visible.

Argosy. A ship of great burden, particularly of the Levant.

Argozin, or Argnesys. The person who attended to the shackles of the galley-slaves.

Argument. (Lat. *argumentum*, a reason.) In astronomical tables the argument is that quantity upon which the tabulated one depends, and with which, therefore, the table is "entered." Thus, in a table of correction for refraction, the altitude is the argument. When the element tabulated depends upon two given ones, then there are two arguments with which to enter the table,—one at the side, the other at the top. Thus, for the correction for the moon's altitude, the arguments of the principal table are the apparent altitude and the minutes of the moon's horizontal parallax.

Argus-shell. A species of shell beautifully variegated with spots, resembling in some measure those in a peacock's tail.

Aries, the Constellation of. (Lat. *Aries*, *Arietis*, "The Ram.") The first constellation of the

ancient zodiac, marking the period for the commemoration of the mythical golden fleece. The only two stars in it of any note are α and β near together in the horns, α being the more northerly.

ARIES, THE SIGN OF. The division of the ecliptic, including the first 30° of longitude, reckoning from the first point of Aries. This origin, owing to the precession of the equinoxes, is at present in the constellation Pisces. Symbol γ.

ARIES, FIRST POINT OF. The "*Vernal Equinoctial Point*," one of the points where the ecliptic crosses the equinoctial, so called as being the commencement of the sign Aries. See EQUINOCTIAL POINTS.

Aries. A battering-ram. (*Roman Antiq.*)

Aris. Sharp corners of stones in piers and docks.

Aris-pieces. Those parts of a made mast which are under the hoops.

Ark. Noah's vessel. It was 300 cubits in length, 50 in breadth, and 30 in height, and it was payed over with bitumen. A comparison of its proportions with those of the "Great Eastern" shows a considerable similarity. Reckoning the cubit at 21 inches, the length of the ark would be 525 feet, breadth 87 feet 6 inches, height 52 feet 6 inches, the "Great Eastern" being in length 680 feet, breadth 83, depth 58. It is mentioned by German commentators that Peter Jansen, in 1609, built a vessel of the same proportions as the ark, though smaller, viz.: length 120, width 20, depth 12 feet. It was found most convenient for stowage, containing one-third more freight than ordinary vessels of the same tonnage, though it was unsuited for making way quickly through the water.

ARK. A mare's-tail cloud. A flat-boat.

Arm. A weapon. An inlet of the sea. The end of a yard, beam, bracket, or axle. A branch of the military service. One of the wings of angle-iron. The part of an anchor to which the flukes are attached. An index-hand or pointer.

TO ARMS! A summons to war or battle.

UNDER ARMS. Armed and ready for fighting.

TO BE IN ARMS. To be in a state of hostility.

STAND OF ARMS. A complete set for one soldier, with equipments; frequently the rifle and bayonet alone.

Arm. To fit, furnish, and provide for war. To wind rope-yarns around about a cross bar shot to facilitate ramming it home. To put tallow in the cavity at the bottom of a lead to bring up specimens of the bottom.

ARM AND AWAY! The order for armed boats to prepare for service.

Armada, The Invincible. The famous Spanish armament so called consisted of 150 ships, 2650 great guns, 20,000 soldiers, 8000 sailors, and 2000 volunteers, under the Duke of Medina Sidonia. It arrived in the Channel, July 19, 1588, and was defeated the next day by Drake and Howard. Ten fire-ships having been sent into the enemy's fleet, they cut their cables, put to sea, and endeavored to return to their rendezvous between Calais and Gravelines; the English fell upon them, took many ships, and Admiral Howard maintained a running fight from the 21st of July to the 27th, obliging the shattered fleet to bear away for Scotland and Ireland, where a storm dispersed them, and the remainder of the armament returned by the North Sea to Spain. The Spaniards lost fifteen capital ships in the engagement, and 5000 men; seventeen ships were lost or taken on the coast of Ireland, and upwards of 5000 men were drowned, killed, or taken prisoners. The English lost but one ship.

Armadilla. A squadron of guarda-costas which formerly cruised on the coast of South America to prevent smuggling.

Armador. A Spanish privateer.

Armament. A term expressing collectively all the great guns and small-arms, with their equipments, but generally applied to the great guns only.

Armamenta. The rigging, tackling, and all necessary furniture of an ancient ship.

Armatæ. Ancient ships fitted with sails and oars, but which fought under oars only.

Armature. A piece of soft metal connecting the poles of a magnet. It serves to prevent the dissipation of the magnetic force.

Arm-chest. A portable locker to afford a ready supply of arms and accoutrements.

Armed. Supplied with weapons; fitted and furnished for war.

Armed-in-flute. Partially armed, a part of the battery having been removed and the effective armament thus reduced below that which the vessel rates.

Armed-mast. A mast made of more than one tree.

Armed Neutrality. See NEUTRALITY.

Armed-ship. A vessel fitted out by private parties to cruise against an enemy's commerce. She is furnished with a letter-of-marque.

Armed-stem. A prow strengthened by armor.

Arming. The tallow used to arm the lead.

Armings. Red dress cloths, formerly hung outside the upper-works on holidays. A kind of boarding-netting.

Armipotent. Powerful in war.

Armistice. A cessation of arms for a short time by convention; a truce.

Armlet. A small arm of the sea.

Armogan. An old term for good season or opportunity for navigation, which if neglected rendered valid a claim for demurrage. A Mediterranean term for fine weather.

Armor. The term, as now generally accepted, refers to metallic protection against the fire of artillery, whether applied to ships or forts. The metal of which armor has been heretofore composed was iron; but the development in the power of artillery has rendered it necessary to seek other metals which would be able to offer a more effective resistance to the impact of heavy shot with high velocities. Steel has been much experimented with, and has been partially adopted, and later experiments lead to the supposition that a combination of iron and steel, called "compound armor," will ultimately be in general use. A description of this combination of metals will be found under its proper heading. The thickness of armor must of course depend upon the service on which a ship is to be employed and upon her floating capacity; and, in case of forts, upon the depth of water in the approaching channels, which will determine the character of vessel that is likely to be able to approach within range; but interesting questions have arisen as to the manner in which armor should be applied, whether it should be left altogether unsupported, or whether partially sup-

ported, or whether assisted by direct support from the structure to which it is attached, or whether elastic or solid backing is the most advantageous. We will review some of these cases which have constituted the points of discussion on armor.

Fig. 1 represents the armor-plate as applied to the "Warrior," the first regular ironclad vessel of modern times. In this case the armor is $4\frac{1}{2}$ inches thick, with a wood backing of 18 inches and a skin-plating of $\frac{5}{8}$ inch. The object of the iron plate is to offer a strong obstacle to the blow of the projectile, expending, unaided, its whole power of resistance in the effort. So much of the energy of the projectile as can be absorbed by the strength of the plate neutralizes that amount of the damage that might have been done to the vessel, and if the plate is destroyed it has done its duty in affording this much protection.

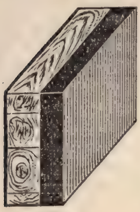

Fig. 1.

The wood backing acts as a cushion to save the hull of the vessel from receiving any damage from the shock of the impact. This is the most simple means of applying armor. It is, in the words of an eminent constructor, "a good thickness of wood with a patch of iron on the outside," which he declared to be "the best armor in the world for ships."

An improvement on this plan of applying armor was suggested by Mr. Chalmers, of England, who, observing the easy manner in which the wood backing yielded to the force of impact, conceived the idea of reinforcing it so as to prevent it from being so readily deranged. His idea was that, as the force of impact was confined to one point, and as the wood backing naturally yielded in all directions to the pressure applied, an increased element of support could be supplied to the wood backing if this tendency could be controlled. Accordingly, he proposed that thin plates of iron should be sandwiched in, horizontally, between the layers of wood backing, so as to control in a measure the yielding of the wood in a vertical direction. These plates of iron were loosely disposed between the layers of wood, being attached neither to the skin-plating nor to the armor. On this principle there was constructed in England a Chalmers target, which was fired at with very good results favoring the idea, but it was never officially adopted by the English government. Fig. 2 represents the "Warrior" armor with the Chalmers plates, as proposed by the inventor.

About the time of the experiments with the Chalmers target, the chief constructor of the English admiralty introduced into the construction of vessels, intended for ironclads, a horizontal iron girder on the outside of the hulls, which was riveted to the side by angle-irons, and which gave much additional rigidity to the hull. Fig. 3 represents the armor of the "Bellerophon," in which the horizontal girder was introduced.

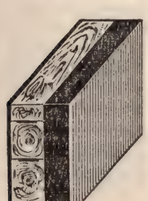

Fig. 2.

In comparing Figs. 2 and 3, it will be seen that the object of the horizontal plate of the Chalmers target is achieved in the backing of the armor of the "Bellerophon," but with a difference. In both instances the horizontal disposition of the iron plate between the layers of the wood backing satisfies the demand made by Mr. Chalmers for the support of the wood backing, but the proposition of Mr. Chalmers went no farther than this. His idea was simply to reinforce the backing so as to enable it to afford a more decided support to the armor; the object was to prevent the derangement of the wood backing, consequent upon impact at one point, by obstructing the vertical yielding of the wood away from the point of pressure. This effort was confined solely to the backing. But, in the "Bellerophon" armor, it will be seen that the horizontal girder, which does the work of the Chalmers plate between the layers of the wood backing, is connected with the hull of the vessel, and forms a part of the structure. This involves another and a very important consideration, for the shock of impact is thus carried to the hull of the vessel, and the consideration of the subject presents a very different aspect. A "thickness of wood with a patch of iron on the outside," bolted to a ship's side, is simply an independent attachment, and if the armor is shattered by the projectile, and the backing is pierced, all the independent work that can be done by this covering has been performed; but if the inner face of the armor rests against the edge of a horizontal iron plate or girder which is connected to the hull, this plate acts as a strut behind a target, and in supporting the armor it receives the force of the blow, which it communicates to the hull. A point made in defense of the use of the girder as a support to the armor is, that the force of the shock is not communicated to one point alone of the frame of the hull, but is disseminated along an extensive portion of the vessel on each side of the point of impact.

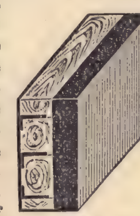

Fig. 3.

Mr. John Hughes, of the late Millwall Iron-Works, on the Thames, England, developed the idea of support to the armor-plate by the introduction of a hollow stringer, which bears his name, which was most successfully applied in the celebrated Millwall shield,—a target which was fired at at Shoeburyness in 1868. The Millwall shield exhibited very superior power of resistance to all other targets that were experimented on at that time. The experiments of that year were made particularly interesting from the fact that a Rodman 15-inch gun was one of those that were used in the firing, and the inferiority of the gun in capacity to penetrate armor was made clearly perceptible. Fig. 4 represents the Hughes hollow girder or stringer, which is placed horizontally and riveted to the side of the vessel.

The hollow portion of the stringer is filled in with oak.

On the closing of the Millwall works, Mr. Hughes undertook the establishment of large iron-works in Russia, under the patronage of the government, and his hollow stringers were adopted by that government and were applied to the turreted vessel called the "Hercules" that was building in St. Petersburg in 1871.

The name of this vessel was afterwards changed to "Peter the Great." The hollow stringers, as applied to this vessel, were estimated to be equal to two inches of iron in increasing her defensive capacity. An objection has been made to the use of the Hughes hollow stringer on the ground that it gave too much solidity to the backing, thereby neutralizing the advantage that was supposed to rest in the elasticity afforded by the wood cushion; but the Russian authorities assert that, under the violence of the impact of a heavy projectile, there is a de-

Fig. 4.

cided amount of elasticity developed in the stringer itself, which is quite sufficient to refute the charge that the whole structure is rendered rigid by the use of this device. In the case of the "Peter the Great," the Hughes stringers were not placed in positive contact with the armor-plate, but were provided with a cushion of lignum-vitæ, about two inches thick, which intervened between the outer face of the stringer and the inner side of the plate; this was considered as a refinement in the details of applying the stringer, which answered all objections to its use.

Fig. 5 represents a method of reinforcing the backing for armor which was adopted for the "Colossus" and her class of monitors for the United States navy, but the idea has not progressed beyond its conception.

At the present time the Chalmers horizontal plate, as applied by the English admiralty, connected by an angle-iron to the hull and encircling the vessel, may be considered as the most generally adopted plan of reinforcing the armor of ironclad ships.

In the case of forts, the general plan is to plate with iron the stone-works already constructed, and, at Spithead, for example, the same plan is carried out with new fortifications; but a notable exception is made to this rule by the Russians in the new works which they have established for the defense of St. Petersburg at Cronstadt. A description of the different systems of armor used in these defenses will be the best citation that can be made of such plans for defense as have been considered worthy of being adopted.

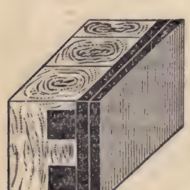

Fig. 5.

On the south side of the channel the defenses consist entirely of turrets, constructed on the English plan of rotation as used in the English turreted ironclads. The outside plating of these turrets is 12 and 14 inches thick, and the hollow stringers of Hughes constitute the backing.

On the northern side of the channel there are erected five casemated batteries, the armor of each differing from that of all the others.

Fig. 6 represents the system adopted for the first one of these batteries. It consists of a 9-inch iron plate, backed by 12 inches of teak, resting against a 1-inch plate of iron, which is sup-

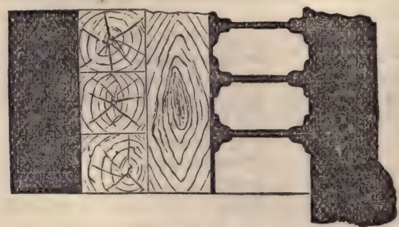

Fig. 6.

ported by horizontal girders of iron, 12 inches wide, riveted to an inner 1-inch skin, all of which is backed by struts, which serve to divide the interior space in the battery allotted to the service of each.

Fig. 7 represents the armor of the second battery, which is constructed on the same plan as that of the first battery, with the exception of the girders and the inner skin, the 1-inch plate behind the wood backing forming the inner skin. In this plan the wood backing is increased to 18 inches thickness.

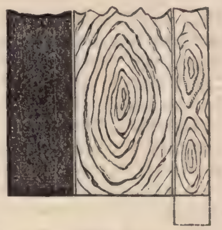

Fig. 7.

Fig. 8 represents the armor of the third battery, which is called the Lancaster armor. The edges of the plates are tongued and grooved, and are built up one upon the other. A part of each plate has a thickness of 14 inches, while the rest of the same plate is 8 inches thick. The inner side of this armor presents a surface of horizontal ribs, the exterior surface is smooth, the inequality of the thickness of each plate being confined to the inner side. The armor is supported behind by iron uprights, having on one surface projecting squares, which enter into the recesses between the ribs of the plates. These uprights are separated by intervals of 2 or 3 feet. The whole is backed by struts.

Fig. 8.

Fig. 9 represents the fourth battery with its armor. This battery is built of granite blocks of Finland stone, 10 feet thick. This is covered by 2 inches of teak, on which is placed the armor, consisting of plates 9 inches in thickness. This construction not requiring the support of struts, the battery is quite open from one end to the other, which gives the beautiful stone an opportunity of showing to advantage.

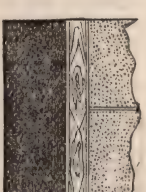

Fig. 9.

Fig. 10 represents the fifth battery, which has 9 inches of armor on the exterior. Behind this there are placed uprights of iron 6 inches square

placed 6 inches apart, the intervals being filled with wood. Behind this is a wood backing consisting of 12 inches of teak. Behind this are placed the hollow stringers of Hughes filled in with wood. These stringers are 10 inches in width, the thickness at the outer rectangular face is 1½ inch, and the spread of the angle-irons forming their base is 12 inches. The stringers are thus 12 inches apart. These are riveted by their angle-iron base to the inner skin of 1-inch iron.

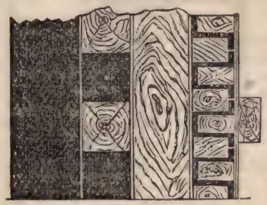

FIG. 10.

In this combination of systems the Russian authorities have adopted each in its completeness. Each invention has been taken as a whole, and the result is a combination of many systems without a complication of different ideas.

Propositions have been made to increase the elasticity of the backing by the introduction of hardened rubber, etc., but these plans have been found rather to assist than to impede the penetration of projectiles.—*E. Simpson, Commodore U.S.N.*

Armor, Compound. Wrought iron and steel have, each, advantages and disadvantages as material for armor for vessels of war. Wrought iron is tenacious, but does not offer sufficient resistance to the *punching* power of the projectile, whereas steel offers great resistance to the punching power, but is comparatively easily crumbled or shattered by a succession of blows.

COMPOUND ARMOR is the result of an effort to combine the good qualities of the two metals by facing the iron armor with steel plates. The steel prevents the penetration of the shot, and the iron backing by its great tenacity prevents the destruction of the steel by shattering.

The plates are welded together in the following manner: The iron plate, raised to a red heat, is placed in a form, and over it is poured molten steel. The temperature of the molten steel being higher than the fusing-point of iron, the surface of the iron plate becomes partially fused, and a complete union of the two metals is obtained.

By this process the weld is not confined to a simple line as in an ordinary weld, but a third metal or semi-steel is formed, varying in thickness from ⅛ to ⅝ of an inch. By the formation of this anomalous steel the two metals are joined together inseparably, or, in other words, the iron has run into the steel, and steel into the iron. Experiments to tear the two asunder have resulted in the tearing of the iron while the weld remained intact.

The compound armor-plates thus obtained may be rolled to any thickness.

By the invention of compound armor it would seem that the defense is once more placed on an equality with the attack.—*H. T. Stockton, Lieutenant U.S.N.*

Armor, Submarine. The water-tight dress of a diver. See DIVING.

Armorer. A petty officer whose duty it is to keep the small-arms in condition for service. Formerly he was the blacksmith of the ship.

Armorer's Mate. The assistant of the armorer.

Armoric. The language of Brittany, Cornwall, and Wales. The original signification was *maritime.*

Armory. A place reserved for the storage of small-arms.

Arm-rack. A frame, generally vertical, for holding small-arms.

Arms. Weapons of offense and defense. Arms and weapons both signify instruments of offense and defense, but we say fire-*arms*, never fire-*weapons*. Cannons, muskets, pistols, are fire-*arms*; bows and arrows, clubs, stones, are *weapons*. Instruments made on purpose to fight with are called *arms*, or *weapons*; such as are accidentally employed to fight with, *weapons*. (*Mech.*) The two parts of a balance or other lever on opposite sides of the fulcrum.

Armstrong, James, Commodore U.S.N. Born Shelbyville, Ky., January 17, 1794, died Charlestown, Mass., August 27, 1868. Midshipman, November 15, 1809; lieutenant, April 27, 1816; commander, March 3, 1825; captain, September 8, 1841; commodore, July 16, 1866. Captured in the "Frolic" in 1814 by the British frigate "Orpheus," and kept a prisoner until March, 1815. Commanded the East India Squadron 1855–58, and in 1857 attacked and captured the Barrier forts in the Canton River. Compelled by a large rebel force to surrender the Pensacola navy-yard, January 12, 1861.

Armstrong, Sir William George. Noted for various mechanical inventions, and particularly that of a gun of extraordinary power and precision. Born at Newcastle, England, in 1810, was articled to Mr. Armourer Donkin, an eminent solicitor in Newcastle, who, at the expiration of his time, made him a partner. About 1838, observing one day a little stream descending along a height near Newcastle and driving but a single mill, he thought to how much more purpose it might be applied hydraulically, and thus was led into a course of experimenting which resulted in his producing a much improved hydraulic engine. In 1845 he invented a hydraulic crane, which has proved to be of eminent utility in raising weights in harbors. Soon after the invention of the gun which bears his name an office was created for him, that of Chief Engineer of Rifled Ordnance. For description of Armstrong gun, see ORDNANCE.

Army. An armed force under regular military organization employed for national offense or defense. An army may comprise the whole military force employed by a state, or only a portion under a particular commander. A fleet is sometimes called a naval army.

Armye. An early name for a fleet.

Arnot. A shrimp.

Arquebuse. A sort of hand-gun; an old species of fire-arm resembling a musket, and supported upon a forked rest when in use.

Arrack. A spirituous liquor manufactured in the East Indies from various substances, but chiefly from fermented rice and the sap of the cocoa palm.

Arraign. To call, or set as a prisoner, at the bar of the court to answer to the matter charged in an indictment or complaint.

Array. The order of battle. The whole body of officers constituting a court-martial.

To ARRAY. To equip; to arm for battle; to arrange in order of battle.

Arrears. That which is behind in payment, but supposes a part already paid.

Arrest. To suspend from duty, and restrain from liberty, preparatory to a court-martial.

Arrow. A slender shaft to be shot from a bow. It is generally armed at one end and feathered at the other, though the natives of Africa frequently feather the barbed end.

Arsenal. A manufactory or depository for arms and all military equipments.

Artemon. The mainsail of ancient ships.

Articles. The express stipulations to which a seaman binds himself when he joins a merchant ship.

Articles for the Government of the United States Navy. The Navy of the United States shall be governed by the following Articles:

Article 1. The commanders of all fleets, squadrons, naval stations, and vessels belonging to the navy are required to show in themselves a good example of virtue, honor, patriotism, and subordination; to be vigilant in inspecting the conduct of all persons who are placed under their command; to guard against and suppress all dissolute and immoral practices, and to correct, according to the laws and regulations of the navy, all persons who are guilty of them; and any such commander who offends against this article shall be punished as a court-martial may direct.

Article 2. The commanders of vessels and naval stations to which chaplains are attached shall cause divine service to be performed on Sunday, whenever the weather and other circumstances allow it to be done; and it is earnestly recommended to all officers, seamen, and others in the naval service diligently to attend at every performance of the worship of Almighty God.

Article 3. Any irreverent or unbecoming behavior during divine service shall be punished as a general or summary court-martial may direct.

Article 4. The punishment of death, or such other punishment as a court-martial may adjudge, may be inflicted on any person in the naval service—

1. Who makes, or attempts to make, or unites with any mutiny or mutinous assembly, or, being witness to or present at any mutiny, does not do his utmost to suppress it; or, knowing of any mutinous assembly or of any intended mutiny, does not immediately communicate his knowledge to his superior or commanding officer;

2. Or disobeys the lawful orders of his superior officer;

3. Or strikes or assaults, or attempts or threatens to strike or assault his superior officer while in the execution of the duties of his office;

4. Or gives any intelligence to, or holds or entertains any intercourse with, an enemy or rebel, without leave from the President, the Secretary of the Navy, the commander-in-chief of the fleet, the commander of the squadron, or, in case of a vessel acting singly, from his commanding officer;

5. Or receives any message or letter from an enemy or rebel, or, being aware of the unlawful reception of such message or letter, fails to take the earliest opportunity to inform his superior or commanding officer thereof;

6. Or, in time of war, deserts or entices others to desert;

7. Or, in time of war, deserts or betrays his trust, or entices or aids others to desert or betray their trust;

8. Or sleeps upon his watch;

9. Or leaves his station before being regularly relieved;

10. Or intentionally or willfully suffers any vessel of the navy to be stranded, or run upon rocks or shoals, or improperly hazarded; or maliciously or willfully injures any vessel of the navy, or any part of her tackle, armament, or equipment, whereby the safety of the vessel is hazarded or the lives of the crew exposed to danger;

11. Or unlawfully sets on fire, or otherwise unlawfully destroys, any public property not at the time in possession of an enemy, pirate, or rebel;

12. Or strikes or attempts to strike the flag to an enemy or rebel, without proper authority, or, when engaged in battle, treacherously yields or pusillanimously cries for quarter;

13. Or, in time of battle, displays cowardice, negligence, or disaffection, or withdraws from or keeps out of danger to which he should expose himself;

14. Or, in time of battle, deserts his duty or station, or entices others to do so;

15. Or does not properly observe the orders of his commanding officer, and use his utmost exertions to carry them into execution, when ordered to prepare for or join in, or when actually engaged, in battle, or while in sight of an enemy;

16. Or, being in command of a fleet, squadron, or vessel acting singly, neglects, when an engagement is probable, or when an armed vessel of an enemy or rebel is in sight, to prepare and clear his ship or ships for action;

17. Or does not, upon signal for battle, use his utmost exertions to join in battle;

18. Or fails to encourage, in his own person, his inferior officers and men to fight courageously;

19. Or does not do his utmost to overtake and capture or destroy any vessel which it is his duty to encounter;

20. Or does not afford all practicable relief and assistance to vessels belonging to the United States or their allies when engaged in battle.

Article 5. All persons who, in time of war, or of rebellion against the supreme authority of the United States, come or are found in the capacity of spies, or who bring or deliver any seducing letter or message from an enemy or rebel, or endeavor to corrupt any person in the navy to betray his trust, shall suffer death, or such other punishment as a court-martial may adjudge.

Article 6. If any person belonging to any public vessel of the United States commits the crime of murder without the territorial jurisdiction thereof, he may be tried by court-martial and punished with death.

Article 7. A naval court-martial may adjudge the punishment of imprisonment for life, or for a stated term, at hard labor, in any case where it is authorized to adjudge the punishment of death; and such sentences of imprisonment and hard labor may be carried into execution in any prison or penitentiary under the control of the United States, or which the United States may be allowed, by the legislature of any State, to use; and persons so imprisoned in the prison or penitentiary of any State or Territory shall be subject, in all respects, to the same discipline

and treatment as convicts sentenced by the courts of the State or Territory in which the same may be situated.

Article 8. Such punishment as a court-martial may adjudge may be inflicted on any person in the navy—

1. Who is guilty of profane swearing, falsehood, drunkenness, gambling, fraud, theft, or any other scandalous conduct tending to the destruction of good morals;

2. Or is guilty of cruelty toward, or oppression or maltreatment of, any person subject to his orders;

3. Or quarrels with, strikes, or assaults, or uses provoking or reproachful words, gestures, or menaces toward, any person in the navy;

4. Or endeavors to foment quarrels between other persons in the navy;

5. Or sends or accepts a challenge to fight a duel or acts as a second in a duel;

6. Or treats his superior officer with contempt, or is disrespectful to him in language or deportment, while in the execution of his office;

7. Or joins in or abets any combination to weaken the lawful authority of, or lessen the respect due to, his commanding officer;

8. Or utters any seditious or mutinous words;

9. Or is negligent or careless in obeying orders, or culpably inefficient in the performance of duty;

10. Or does not use his best exertions to prevent the unlawful destruction of public property by others;

11. Or, through inattention or negligence, suffers any vessel of the navy to be stranded, or run upon a rock or shoal, or hazarded;

12. Or, when attached to any vessel appointed as convoy to any merchant or other vessels, fails diligently to perform his duty, or demands or exacts any compensation for his services, or maltreats the officers or crews of such merchant or other vessels;

13. Or takes, receives, or permits to be received, on board the vessel to which he is attached, any goods or merchandise, for freight, sale, or traffic, except gold, silver, or jewels, for freight or safe-keeping; or demands or receives any compensation for the receipt or transportation of any other article than gold, silver, or jewels, without authority from the President or Secretary of the Navy;

14. Or knowingly makes or signs, or aids, abets, directs, or procures the making or signing of, any false muster;

15. Or wastes any ammunition, provisions, or other public property; or, having power to prevent it, knowingly permits such waste;

16. Or, when on shore, plunders, abuses, or maltreats any inhabitant, or injures his property in any way;

17. Or refuses, or fails to use, his utmost exertions to detect, apprehend, and bring to punishment all offenders, or to aid all persons appointed for that purpose;

18. Or, when rated or acting as master-at-arms, refuses to receive such prisoners as may be committed to his charge, or, having received them, suffers them to escape, or dismisses them without orders from the proper authority;

19. Or is absent from his station or duty without leave, or after his leave has expired;

20. Or violates or refuses obedience to any lawful general order or regulation issued by the Secretary of the Navy;

21. Or, in time of peace, deserts, or attempts to desert, or aids and entices others to desert;

22. Or receives or entertains any deserter from any other vessel of the navy, knowing him to be such, and does not, with all convenient speed, give notice of such deserter to the commander of the vessel to which he belongs, or to the commander-in-chief, or to the commander of the squadron.

Article 9. Any officer who absents himself from his command without leave may, by the sentence of a court-martial, be reduced to the rating of an ordinary seaman.

Article 10. Any commissioned officer of the navy or marine corps who, having tendered his resignation, quits his post or proper duties without leave, and with intent to remain permanently absent therefrom, prior to due notice of the acceptance of such resignation, shall be deemed and punished as a deserter.

Article 11. No person in the naval service shall procure stores or other articles or supplies for, and dispose thereof to, the officers or enlisted men on vessels of the navy, or at navy-yards or naval stations, for his own account or benefit.

Article 12. No person connected with the navy shall, under any pretense, import in a public vessel any article which is liable to the payment of duty.

Article 13. Distilled spirits shall be admitted on board of vessels of war only upon the order and under the control of the medical officers of such vessels, and to be used only for medical purposes.

Article 14. Fine and imprisonment, or such other punishment as a court-martial may adjudge, shall be inflicted upon any person in the naval service of the United States—

Who presents or causes to be presented to any person in the civil, military, or naval service thereof, for approval or payment, any claim against the United States or any officer thereof, knowing such claim to be false or fraudulent; or

Who enters into any agreement or conspiracy to defraud the United States by obtaining, or aiding others to obtain, the allowance or payment of any false or fraudulent claim; or

Who, for the purpose of obtaining, or aiding others to obtain, the approval, allowance, or payment of any claim against the United States, or against any officer thereof, makes or uses, or procures or advises the making or use of, any writing or other paper, knowing the same to contain any false or fraudulent statement; or

Who, for the purpose of obtaining, or aiding others to obtain, the approval, allowance, or payment of any claim against the United States or any officer thereof, makes or procures or advises the making of any oath to any fact, or to any writing or other paper, knowing such oath to be false; or

Who, for the purpose of obtaining, or aiding others to obtain, the approval, allowance, or payment of any claim against the United States or any officer thereof, forges or counterfeits, or procures or advises the forging or counterfeiting of any signature upon any writing or other paper, or uses or procures or advises the use of any such signature, knowing the same to be forged or counterfeited; or

Who, having charge, possession, custody, or control of any money or other property of the United States, furnished or intended for the naval service thereof, knowingly delivers, or causes to be delivered, to any person having authority to receive the same, any amount thereof less than that for which he receives a certificate or receipt; or

Who, being authorized to make or deliver any paper certifying the receipt of any money or other property of the United States, furnished or intended for the naval service thereof, makes or delivers to any person such writing, without having full knowledge of the truth of the statement therein contained, and with intent to defraud the United States; or

Who steals, embezzles, knowingly and willfully misappropriates, applies to his own use or benefit, or wrongfully and knowingly sells or disposes of any ordnance, arms, equipments, ammunition, clothing, subsistence stores, money, or other property of the United States, furnished or intended for the military or naval service thereof; or

Who knowingly purchases, or receives in pledge for any obligation or indebtedness, from any other person who is a part of, or employed in, said service, any ordnance, arms, equipments, ammunition, clothing, subsistence stores, or other property of the United States, such other person not having lawful right to sell or pledge the same; or

Who executes, attempts, or countenances any other fraud against the United States.

And if any person, being guilty of any of the offenses described in this article while in the naval service, receives his discharge, or is dismissed from the service, he shall continue to be liable to be arrested and held for trial and sentence by a court-martial, in the same manner and to the same extent as if he had not received such discharge nor been dismissed.

Article 15. The commanding officer of every vessel in the navy entitled to or claiming an award of prize-money, shall, as soon as may be practicable after the capture, transmit to the Navy Department a complete list of the officers and men of his vessel entitled to share, stating therein the quality of each person rating; and every commanding officer who offends against this article shall be punished as a court-martial may direct.

Article 16. No person in the navy shall take out of a prize, or vessel seized as a prize, any money, plate, goods, or any part of her equipment, unless it be for the better preservation thereof, or unless such articles are absolutely needed for the use of any of the vessels or armed forces of the United States, before the same are adjudged lawful prize by a competent court; but the whole, without fraud, concealment, or embezzlement, shall be brought in, in order that judgment may be passed thereon; and every person who offends against this article shall be punished as a court-martial may direct.

Article 17. If any person in the navy strips off the clothes of, or pillages, or in any manner maltreats any person taken on board a prize, he shall suffer such punishment as a court-martial may adjudge.

Article 18. If any officer or person in the naval service employs any of the forces under his command for the purpose of returning any fugitive from service or labor, he shall be dismissed from the service.

Article 19. Any officer who knowingly enlists into the naval service any deserter from the naval or military service of the United States, or any insane or intoxicated person, or any minor between the ages of 16 and 18 years without the consent of his parents or guardian, or any minor under the age of 16 years, shall be dishonorably dismissed from the service of the United States.

Article 20. Every commanding officer of a vessel in the navy shall obey the following rules:

1. Whenever a man enters on board, the commanding officer shall cause an accurate entry to be made in the ship's books, showing his name, the date, place, and term of his enlistment, the place or vessel from which he was received on board, his rating, his descriptive list, his age, place of birth, and citizenship, with such remarks as may be necessary.

2. He shall, before sailing, transmit to the Secretary of the Navy a complete list of the rated men under his command, showing the particulars set forth in rule one, and a list of officers and passengers, showing the date of their entering. And he shall cause similar lists to be made out on the first day of every third month and transmitted to the Secretary of the Navy as opportunities occur, accounting therein for any casualty which may have happened since the last list.

3. He shall cause to be accurately minuted on the ship's books the names of any persons dying or deserting, and the times at which such death or desertion occurs.

4. In case of the death of any officer, man, or passenger on said vessel, he shall take care that the paymaster secures all the property of the deceased, for the benefit of his legal representatives.

5. He shall not receive on board any man transferred from any other vessel or station to him, unless such man is furnished with an account, signed by the captain and paymaster of the vessel or station from which he came, specifying the date of his entry on said vessel or at said station, the period and term of his service, the sums paid him, the balance due him, the quality in which he was rated, and his descriptive list.

6. He shall, whenever officers or men are sent from his ship, for whatever cause, take care that each man is furnished with a complete statement of his account, specifying the date of his enlistment, the period and term of his service, and his descriptive list. Said account shall be signed by the commanding officer and paymaster.

7. He shall cause frequent inspections to be made into the condition of the provisions on his ship, and use every precaution for their preservation.

8. He shall frequently consult with the surgeon in regard to the sanitary condition of his crew, and shall use all proper means to preserve their health. And he shall cause a convenient place to be set apart for sick or disabled men, to which he shall have them removed, with their hammocks and bedding, when the surgeon so advises, and shall direct that some of the crew attend them and keep the place clean.

9. He shall attend in person, or appoint a

proper officer to attend, when his crew is finally paid off, to see that justice is done to the men and to the United States in the settlement of the accounts.

10. He shall cause the articles for the government of the navy to be hung up in some public part of the ship, and read once a month to his ship's company.

Every commanding officer who offends against the provisions of this article shall be punished as a court-martial may direct.

Article 21. When the crew of any vessel of the United States are separated from their vessel by means of her wreck, loss, or destruction, all the command and authority given to the officers of such vessel shall remain in full force until such ship's company shall be regularly discharged from or ordered again into service, or until a court-martial or court of inquiry shall be held to inquire into the loss of said vessel. And if any officer or man, after such wreck, loss, or destruction, acts contrary to the discipline of the navy, he shall be punished as a court-martial may direct.

Article 22. All offenses committed by persons belonging to the navy which are not specified in the foregoing articles shall be punished as a court-martial may direct.

Article 23. All offenses committed by persons belonging to the navy while on shore shall be punished in the same manner as if they had been committed at sea.

Article 24. No commander of a vessel shall inflict upon a commissioned or warrant officer any other punishment than private reprimand, suspension from duty, arrest, or confinement, and such suspension, arrest, or confinement shall not continue longer than ten days, unless a further period is necessary to bring the offender to trial by a court-martial; nor shall he inflict, or cause to be inflicted, upon any petty officer, or person of inferior rating, or marine, for a single offense, or at any one time, any other than one of the following punishments, namely:

1. Reduction of any rating established by himself.
2. Confinement, with or without irons, single or double, not exceeding ten days, unless further confinement be necessary, in the case of a prisoner to be tried by court-martial.
3. Solitary confinement, on bread and water, not exceeding five days.
4. Solitary confinement not exceeding seven days.
5. Deprivation of liberty on shore.
6. Extra duties.

No other punishment shall be permitted on board of vessels belonging to the navy, except by sentence of a general or summary court-martial. All punishments inflicted by the commander, or by his order, except reprimands, shall be fully entered upon the ship's log.

Article 25. No officer who may command by accident, or in the absence of the commanding officer, except when such commanding officer is absent for a time by leave, shall inflict any other punishment than confinement.

Article 26. Summary courts-martial may be ordered upon petty officers and persons of inferior ratings by the commander of any vessel, or by the commandant of any navy-yard, naval station, or marine barracks to which they belong, for the trial of offenses which such officer may deem deserving of greater punishment than such commander or commandant is authorized to inflict, but not sufficient to require trial by a general court-martial.

Article 27. A summary court-martial shall consist of three officers not below the rank of ensign, as members, and of a recorder. The commander of a ship may order any officer under his command to act as such recorder.

Article 28. Before proceeding to trial the members of a summary court-martial shall take the following oath or affirmation, which shall be administered by the recorder: "I, A B, do swear (or affirm) that I will well and truly try, without prejudice or partiality, the case now depending, according to the evidence which shall be adduced, the laws for the government of the navy, and my own conscience." After which the recorder of the court shall take the following oath or affirmation, which shall be administered by the senior member of the court: "I, A B, do swear (or affirm) that I will keep a true record of the evidence which shall be given before this court and of the proceedings thereof."

Article 29. All testimony before a summary court-martial shall be given orally, upon oath or affirmation, administered by the senior member of the court.

Article 30. Summary courts-martial may sentence petty officers and persons of inferior ratings to any one of the following punishments, namely:

1. Discharge from the service with bad-conduct discharge; but the sentence shall not be carried into effect in a foreign country;
2. Solitary confinement, not exceeding thirty days, in irons, single or double, on bread and water, or on diminished rations;
3. Solitary confinement, in irons, single or double, not exceeding thirty days;
4. Solitary confinement not exceeding thirty days;
5. Confinement not exceeding two months;
6. Reduction to next inferior rating;
7. Deprivation of liberty on shore on foreign station;
8. Extra police duties, and loss of pay, not to exceed three months, may be added to any of the above-mentioned punishments.

Article 31. A summary court-martial may disrate any rated person for incompetency.

Article 32. No sentence of a summary court-martial shall be carried into execution until the proceedings and sentence have been approved by the officer ordering the court and by the commander-in-chief, or, in his absence, by the senior officer present. And no sentence of such court which involves loss of pay shall be carried into execution until the proceedings and sentence have been approved by the Secretary of the Navy.

Article 33. The officer ordering a summary court-martial shall have power to remit, in part, or altogether, but not to commute, the sentence of the court. And it shall be his duty either to remit any part or the whole of any sentence the execution of which would, in the opinion of the surgeon or senior medical officer on board, given in writing, produce serious injury to the health of the person sentenced; or to submit the case again, without delay, to the same or to another summary court-martial, which shall have power,

upon the testimony already taken, to remit the former punishment; and to assign some other of the authorized punishments in the place thereof.

Article 34. The proceedings of summary courts-martial shall be conducted with as much conciseness and precision as may be consistent with the ends of justice, and under such forms and rules as may be prescribed by the Secretary of the Navy, with the approval of the President; and all such proceedings shall be transmitted, in the usual mode, to the Navy Department.

Article 35. Any punishment which a summary court-martial is authorized to inflict may be inflicted by a general court-martial.

Article 36. No officer shall be dismissed from the naval service except by the order of the President or by sentence of a general court-martial; and in time of peace no officer shall be dismissed except in pursuance of the sentence of a general court-martial or in mitigation thereof

Article 37. When any officer, dismissed by order of the President since 3d March, 1865, makes, in writing, an application for trial, setting forth, under oath, that he has been wrongfully dismissed, the President shall, as soon as the necessities of the service may permit, convene a court-martial to try such officer on the charges on which he shall have been dismissed. And if such court-martial shall not be convened within six months from the presentation of such application for trial, or if such court, being convened, shall not award dismissal or death as the punishment of such officer, the order of dismissal by the President shall be void.

Article 38. General courts-martial may be convened by the President, the Secretary of the Navy, or the commander-in-chief of a fleet or squadron; but no commander of a fleet or squadron in the waters of the United States shall convene such court without express authority from the President.

Article 39. A general court-martial shall consist of not more than thirteen nor less than five commissioned officers as members; and as many officers, not exceeding thirteen, as can be convened without injury to the service, shall be summoned on every such court. But in no case, where it can be avoided without injury to the service, shall more than one-half, exclusive of the president, be junior to the officer to be tried. The senior officer shall always preside, and the others shall take place according to their rank.

Article 40. The president of the general court-martial shall administer the following oath or affirmation to the judge-advocate or person officiating as such:

"I, A B, do swear (or affirm) that I will keep a true record of the evidence given to and the proceedings of this court; that I will not divulge or by any means disclose the sentence of the court until it shall have been approved by the proper authority; and that I will not at any time divulge or disclose the vote or opinion of any particular member of the court, unless required so to do before a court of justice in due course of law."

This oath or affirmation being duly administered, each member of the court, before proceeding to trial, shall take the following oath or affirmation, which shall be administered by the judge-advocate or person officiating as such:

"I, A B, do swear (or affirm) that I will truly try, without prejudice or partiality, the case now depending, according to the evidence which shall come before the court, the rules for the government of the navy, and my own conscience; that I will not by any means divulge or disclose the sentence of the court until it shall have been approved by the proper authority; and that I will not at any time divulge or disclose the vote or opinion of any particular member of the court, unless required so to do before a court of justice in due course of law."

Article 41. An oath or affirmation in the following form shall be administered to all witnesses, before any court-martial, by the president thereof:

"You do solemnly swear (or affirm) that the evidence you shall give in the case now before this court shall be the truth, the whole truth, and nothing but the truth, and that you will state everything within your knowledge in relation to the charges: so help you God; (or, 'this you do under the pains and penalties of perjury.')"

Article 42. Whenever any person refuses to give his evidence or to give it in the manner provided by these articles, or prevaricates, or behaves with contempt to the court, it shall be lawful for the court to imprison him for any time not exceeding two months.

Article 43. The person accused shall be furnished with a true copy of the charges, with the specifications, at the time he is put under arrest; and no other charges than those so furnished shall be urged against him at the trial, unless it shall appear to the court that intelligence of such other charge had not reached the officer ordering the court when the accused was put under arrest, or that some witness material to the support of such charge was at that time absent and can be produced at the trial; in which case reasonable time shall be given to the accused to make his defense against such new charge.

Article 44. Every officer who is arrested for trial shall deliver up his sword to his commanding officer, and confine himself to the limits assigned him, on pain of dismissal from the service.

Article 45. When the proceedings of any general court-martial have commenced, they shall not be suspended or delayed on account of the absence of any of the members, provided five or more are assembled; but the court is enjoined to sit from day to day, Sundays excepted, until sentence is given, unless temporarily adjourned by the authority which convened it.

Article 46. No member of a general court-martial shall, after the proceedings are begun, absent himself therefrom, except in case of sickness, or of an order to go on duty from a superior officer, on pain of being cashiered.

Article 47. Whenever any member of a court-martial, from any legal cause, is absent from the court after the commencement of a case, all the witnesses who have been examined during his absence must, when he is ready to resume his seat, be recalled by the court, and the recorded testimony of each witness so examined must be read over to him, and such witness must acknowledge the same to be correct, and be subject to such further examination as the said member may require. Without a compliance with this rule, and an entry thereof upon the record, a member who shall have been absent during the

examination of a witness shall not be allowed to sit again in that particular case.

Article 48. Whenever a court-martial sentences an officer to be suspended, it may suspend his pay and emoluments for the whole or any part of the time of his suspension.

Article 49. In no case shall punishment by flogging, or by branding, marking, or tattooing on the body be adjudged by any court-martial or be inflicted upon any person in the navy.

Article 50. No person shall be sentenced by a court-martial to suffer death, except by the concurrence of two-thirds of the members present, and in the cases where such punishment is expressly provided in these articles. All other sentences may be determined by a majority of votes.

Article 51. It shall be the duty of a court-martial, in all cases of conviction, to adjudge a punishment adequate to the nature of the offense; but the members thereof may recommend the person convicted as deserving of clemency, and state on the record their reasons for so doing.

Article 52. The judgment of every court-martial shall be authenticated by the signature of the president, and of every member who may be present when said judgment is pronounced, and also of the judge-advocate.

Article 53. No sentence of a court-martial, extending to the loss of life or to the dismissal of a commissioned or warrant officer, shall be carried into execution until confirmed by the President. All other sentences of general court-martial may be carried into execution on confirmation of the commander of the fleet or officer ordering the court.

Article 54. Every officer who is authorized to convene a general court-martial shall have power, on revision of its proceedings, to remit or mitigate, but not to commute, the sentence of any such court which he is authorized to approve and confirm.

Article 55. Courts of inquiry may be ordered by the President, the Secretary of the Navy, or the commander of a fleet or squadron.

Article 56. A court of inquiry shall consist of not more than three commissioned officers as members, and of a judge-advocate, or person officiating as such.

Article 57. Courts of inquiry shall have power to summon witnesses, administer oaths, and punish contempts in the same manner as courts-martial; but they shall only state facts, and shall not give their opinion, unless expressly required so to do in the order for convening.

Article 58. The judge-advocate, or person officiating as such, shall administer to the members the following oath or affirmation: "You do swear (or affirm) well and truly to examine and inquire, according to the evidence, into the matter now before you, without partiality." After which the president shall administer to the judge-advocate, or person officiating as such, the following oath or affirmation: "You do swear (or affirm) truly to record the proceedings of this court, and the evidence to be given in the case in hearing."

Article 59. The party whose conduct shall be the subject of inquiry, or his attorney, shall have the right to cross-examine all the witnesses.

Article 60. The proceedings of courts of inquiry shall be authenticated by the signature of the president of the court and of the judge-advocate, and shall, in all cases not capital, nor extending to the dismissal of a commissioned or warrant officer, be evidence before a court-martial, provided oral testimony cannot be obtained.

Artificer. One who works by hand in wood or metal.

Artificial. Made by art; not genuine.

ARTIFICIAL GLOBE. A spherical representation of the earth or the heavens.

ARTIFICIAL SINES, TANGENTS, ETC. The logarithms of the natural sines, tangents, etc.

ARTIFICIAL NUMBERS. Logarithms.

ARTIFICIAL LINES. Lines on a sector or scale, so contrived as to represent logarithmic signs and tangents, which, by the help of the line of numbers, solve, with tolerable exactness, problems in trigonometry and navigation.

ARTIFICIAL EYE. An eye worked in the end of a rope. It is neater but not so strong as a spliced eye.

Artificial Horizon. A reflector whose surface is perfectly horizontal, used for observing altitudes. Artificial horizons are of two kinds,—those for use on shore, and those for use on board ship.

The most usual form of the shore artificial horizon is a rectangular trough of quicksilver or other fluid. Quicksilver is the fluid most convenient and the best adapted for obtaining a surface which shall quickly subside after being disturbed. No altitude can be observed which is greater than half the range of the instrument; thus, with a sextant no altitude above 60° can be observed. For altitudes less than 15° the observation is generally impracticable. One advantage of the artificial horizon is, that when the angle shown by the instrument is halved to obtain the angle of elevation, all errors of observation are halved at the same time. There is no correction for "dip." The instrument used for observing is sometimes fixed upon a small pillar. In this artificial horizon an essential condition is the parallelism of the faces of plate-glass forming the roof. The effects of refraction may be practically eliminated by these plates being made circular disks which admit of being turned in their own plane. One set of observations having been taken, the plates are turned through 180° and a new set taken, the two being used in combination; or with a common roof the error may be practically eliminated by reversing it. A small mirror of polished metal or of darkened plate-glass is sometimes used as an artificial horizon, its horizontality being ascertained by means of a spirit-level placed upon it, and the adjustment effected by means of screws which form its stand. Such an instrument, though convenient and portable, does not give satisfactory results.

At sea the celestial bodies are sometimes distinctly visible when the horizon is enveloped in mist; the sea-horizon is often disturbed by haze or fog, and by moonlight is often uncertain. Hence the attempts to invent an artificial horizon adapted for use on board ship. Mr. Serson suggested to apply the principle upon which a top, when spinning, tends to preserve a vertical position. A pivot carrying a mirror thus rotating would theoretically give the horizontal reflector required; but it failed in practice. Admiral Beechey's contrivance is more successful.

The telescope of the sextant is fitted with a balance carrying a glass vane, one half of which is colored blue to represent the sea-horizon, and to which the celestial object is brought down. The amount of oscillation above and below the level is indicated by divisions on the glass, the values of which are determined by the maker. Other constructions, where the horizon is attached to the sextant, have been tried with more or less success.

Artillery. Formerly synonymous with archery, but now comprehends everything relating to guns and to the service of guns.

Arx. A fort or castle.

Ascii. The inhabitants of the torrid zone, who, being twice a year under a vertical sun, have no shadow.

Ashes. The earthy part of combustible substances remaining after combustion.

ASH-PIT. The space underneath the grate-bars.

ASH-CHUTE. A receptacle into which ashes are dumped to be conveyed overboard.

ASH-WHIP. A whip for hoisting ashes out of the fire-room.

Ashlar. Blocks of stone masonry fronting docks and piers.

Ashore. On land,—opposed to *aboard;* when applied to a ship, means that she is aground.

Asia. See CONTINENTS.

Asiento. A contract between the king of Spain and other powers, for furnishing the Spanish dominions in America with negro slaves. It began in 1689, and was vested in the South Sea Company in 1713. By the treaty of Utrecht it was transferred to the English, who were to furnish 4800 negroes annually to Spanish America. This contract was given up to Spain at the peace in 1748.

Askew. Awry; aslant.

Aslant. Obliquely.

SAILING ASLANT. Beating to windward.

Asleep. A sail filled with just enough wind for swelling or bellying out is said to be asleep.

Aspect. The general appearance of the land from seaward.

Aspic. An ancient 12-pounder about 11 feet long.

Aspinwall. A seaport of the United States of Colombia, on the Atlantic side of the Isthmus of Panama. The harbor has a depth of water sufficient for the largest ships, and is very spacious. Pop. 2500.

Aspirant de Marine. (*Fr.*) Midshipman.

Assail. To attack with violence or in a hostile manner.

Assault. A hostile attack. An effort to gain possession of a fortification by main force.

Assegai. A spear or javelin used by the Zulus.

Asseguay. A dagger used in the Levant.

Assembly. A beat of the drum or call on the bugle, as a signal to troops to assemble.

Assilag. A name given in the Hebrides to a small bird with a black bill. The stormy petrel.

Assistant. See SURGEON, PAYMASTER, ENGINEER.

Assurance. Insurance. A contract to pay a certain sum on the occasion of a certain event; as, loss or death.

Assurgent. A heraldic term for a man or beast rising out of the sea.

A-starboard. The situation of the helm when the tiller is borne over to the starboard side of the ship.

HARD A-STARBOARD. The order to put the helm over to the extreme limit.

Astatic Needle. See NEEDLE.

A-stay. The anchor is said to be *a-stay* when the cable forms an acute angle with the surface of the water. *A long stay* signifies that the cable forms a line parallel with the main-stay, and *a short stay* means that it is parallel with the fore-stay.

Asteria. A genus of radiated marine animals; the star-fish.

Asterism. A constellation; a group of stars.

Astern. Any distance behind a vessel in the direction of the stern.

TO DROP ASTERN. To be left behind.

TO BE ASTERN OF THE RECKONING. To be behind the position determined by logging.

Asteroid. The name which Herschel proposed to give the minor planets which have been discovered between the orbits of Mars and Jupiter. The first one was discovered in 1801, but since that time over 80 have been added to the number. The largest one is but 300 miles in diameter. They closely resemble small stars, and can only be distinguished from them by their motion.

Astragal. Mouldings on old cannon.

Astral. Relating to the stars.

Astrolabe. The armillary sphere.

A *sea-astrolabe* is a brass ring with a movable arm, for observing altitudes of stars and planets.

Astrology. Formerly synonymous with astronomy; subsequently, the art of foretelling events by the positions and aspects of the stars. Judicial astrology was invented by the Chaldæans, and hence was transmitted to the Egyptians, Greeks, and Romans. It was much in vogue in France in the time of Catherine de Medicis, 1533. The early history of astrology in England is very little known: Bede was addicted to it, 700; and so was Roger Bacon, 1260. Cecil, Lord Burleigh, calculated the nativity of Elizabeth; and she, and all the European princes, were the humble servants of Dee, the astrologer and conjurer. But the period of the Stuarts was the acme of astrology in England. Sir Walter Scott has made ample use of Sir William Lilly, the noted astrologer, in his tales of this period; and it is certain that Lilly was consulted by Charles I. respecting his projected escape from Carisbrook Castle in 1647.

Astronomical Clock. A pendulum clock regulated to sidereal time. The *error* is its difference from sidereal time, and the *rate* is the daily change of error.

The *Astronomical Day* begins at noon, and the hours are numbered from one to twenty-four.

Astronomicals. Sexagesimal fractions.

Astronomy. (Gr. *aster*, a star, any luminary body; *nomos*, a law.) The science which treats of the heavenly bodies. It is generally divided into *Spherical Astronomy*, which treats of the appearances, magnitudes, motions, and distances of the heavenly bodies; and *Physical Astronomy*, which applies the principles of mechanics to explain the motions of the heavenly bodies and the laws by which they are governed. That portion of spherical astronomy which is applied to purposes of navigation is called *Nautical*

Astronomy. See Sun, Planets, Asteroid, Stars, Comets, Eclipses, etc.

The earliest astronomical observations were made at Babylon, it is said, about 2234 B.C. The study was much advanced in Chaldæa under Nabonassar; was known to the Chinese about 1100 B.C., some say centuries before.

Lunar eclipses observed at Babylon, and recorded by Ptolemy, about 720 B.C.

Spherical form of the earth and the true cause of lunar eclipses taught by Thales, about 600 B.C.

Further discoveries by Pythagoras, who taught the doctrine of celestial motions and believed in the plurality of habitable worlds, died about 470 B.C.

Meton introduces the lunar-solar cycle, 433 B.C.

Treatises of Aristotle "concerning the heavens," and of Autolycus "on the motion of the sphere" (earliest extant works on astronomy), about 350 B.C.

Aratus writes a poem on astronomy about 281 B.C.

Archimedes observes solstices, etc., about 212 B.C.

Hipparchus, greatest of Greek astronomers, determines mean motion of sun and moon; discovers precession of equinoxes, etc., about 160–125 B.C.

The precession of the equinoxes confirmed, and the places and distances of the planets discovered by Ptolemy, 139–161 A.D.

Astronomy and geography cultivated by the Arabs about 760 A.D.; brought into Europe about 1200 A.D.

Clocks first used in astronomy about 1500 A.D.

True doctrine of the motions of the planetary bodies revived by Copernicus, founder of modern astronomy; his "Revolution of the Heavenly Bodies" published 1543 A.D.

Astronomy advanced by Tycho Brahe, who yet adheres to the Ptolemaic system, about 1582 A.D.

True laws of the planetary motions announced by Kepler; 1st and 2d, 1609 A.D; 3d, 1618 A.D.

Galileo constructs a telescope, 1609; and discovers Jupiter's satellites, etc., 8th January, 1610 A.D.

Various forms of telescopes and other instruments used in astronomy invented, 1608–40 A.D.

Cartesian system published by Des Cartes, 1637 A.D.

The transit of Venus over the sun's disk first observed by Horrocks, 24th November, 1639 A.D

Cassini draws his meridian line after Dante, 1655 A.D.

The aberration of the light of the fixed stars discovered by Horrebow, 1659 A.D.

Huyghens completes the discovery of Saturn's ring, 1654 A.D.

Gregory invents a reflecting telescope, 1663 A.D.

Charts of the moon constructed by Scheiner, Langrenus, Hevelius, Riccioli, etc., about 1670 A.D.

Discoveries of Römer on the velocity of light, and his observation of Jupiter's satellites, 1675 A.D.

Motion of the sun round its own axis proved by Halley, 1676 A.D.

Newton's "Principia" published, and the system as now taught demonstrated, 1687 A.D.

Catalogue of the stars made by Flamsteed, 1688 A.D.

Cassini's chart of the full moon executed, 1692 A.D.

Satellites of Saturn, etc., discovered by Cassini, 1701 A.D.

Halley predicts the return of the comet (of 1759), 1705 A.D.

Flamsteed's "Historia Cœlestis" published, 1725 A.D.

Aberration of the light of the stars discovered and explained by Dr. Bradley, 1727 A.D.

John Harrison produces chronometers for determining the longitude, 1735 *et seq.*, and obtains the reward, 1764 A.D.

Celestial inequalities found by La Grange, 1780 A.D.

Uranus and satellites discovered by Herschel, 13th March, 1781 A.D.

"Mécanique céleste," by La Place, published 1796 A.D.

Beer and Mädler's map of the moon published, 1834 A.D.

Lord Rosse's telescope constructed, 1828–45 A.D.

The planet Neptune discovered, 23d September, 1846 A.D.

Bond photographs the moon, 1851 A.D.

Hansen's table of the moon published at expense of the British government, 1857 A.D.

Spectrum analysis applied in astronomy, 1861 A.D.

Astrum, or Astron. Sirius, the Dog-star. A cluster of stars.

Aswim. Afloat.

Asylum. A place of refuge.

Asylum, Naval, of the United States. This important and interesting institution has been in existence about half a century, and is situated upon the banks of the Schuylkill, within the limits of the city of Philadelphia, and in the old district of Passyunk.

The property upon which the institution is situated comprises an irregular plat of about 23 acres, bounded by the Gray's Ferry Road, Bainbridge Street, Southerland Avenue (running parallel with the Schuylkill River), and a wall running thence eastward to meet the Gray's Ferry Road again.

Originally a part of a tract of 150 acres, extending from the Schuylkill to Long Lane, it was, long previous to the Revolution, the site of a handsome country-seat, belonging to the Pemberton family, it having been purchased from the Penns in 1735.

The place, which was known as "Plantation," was then quite remote from the built-up parts of the town, and, in spite of its name, appears never to have been a farm, but to have been taken up with lawns, shrubberies, and gardens. The house was of brick; large, square, roomy, and comfortable. This mansion was afterwards, and previous to the erection of the present large building, the naval asylum and hospital. Two brick tenement or servants' houses stood to the north of the mansion, and were also used until superseded by the present building. When demolished, their *débris* was used by Commodore Biddle to metal the roads and walks which now exist.

"Plantation" was a favorite residence for some of the British officers during their occupation of Philadelphia, and there is frequent mention of it in contemporary journals and correspondence. Soldiers were flogged, and one or two hung for depredations upon the gardens and

smoke-houses, and Mrs. Pemberton, whose husband was absent, extorted an ample apology from a certain Lord Murray, who had treated the tenants with "barbarious and unbecoming behavior, very unworthy of a British nobleman and officer, after being previously shown General Howe's protection posted up in the house." For some time previous to the evacuation the house was occupied by General Pattison, the commander of the Royal Artillery.

From the Pembertons the place passed to the Abbots, and was purchased from that family by the government.

On May 26, 1826, Surgeon Thomas Harris, of the navy, was authorized by the Hon. Samuel L. Southard, Secretary of the Navy, to purchase "the Abbot lot, of about 23 acres, for $16,000." From the accounts it appears that $17,000 was ultimately paid, however,—a very small sum compared with the value of the land at this day.

As soon as it was established that we were to have a permanent naval force, it became necessary to make provision for the sick, wounded, and disabled. In 1798 an act of Congress provided that 20 cents a month should be deducted from the pay of all seamen of the merchant marine for the relief of the sick and disabled, the money to be in charge of the Secretary of the Treasury. And in the next year—1799—its benefits were extended to the "officers, seamen, and marines of the navy, who were to receive the same relief as the sick and disabled seamen of the merchant service."

Under the working of this law naval seamen were sent to civil hospitals, where their officers lost control of them, and they disappeared. Nor did it seem proper that officers, seamen, and marines of a military service should, as an afterthought, be foisted upon the Treasury Department. It was evidently necessary for the navy to have a hospital department of its own, in charge of its own medical officers, who, from being identified with the service, could sympathize with and understand the virtues and failings of the seamen. Accordingly, in 1810, an act of Congress appointed the Secretaries of War, the Navy, and the Treasury a "Board of Commissioners of Naval Hospitals," and the fund derived from monthly assessments upon all persons in the naval service was turned over to them, to constitute a "Naval Hospital Fund," and $50,000 from the unexpended balance of the "Marine Hospital Fund" was placed by the same act in their hands, this being the estimated share of the amount which had accrued since the acts of 1798–99.

From this act of 1810 dates the origin of the Naval Asylum, as well as of all the rest of our naval hospitals.

Mr. Paul Hamilton, then Secretary of the Navy, addressed a letter to the House Committee on the Naval Establishment warmly supporting naval hospitals as places of relief and maintenance, not only for the sick of the service, but for the disabled and infirm who should prefer it to a pension. He even recommended that the widows and children of seamen killed in action should be supported in such institutions, the boys to be brought up for the naval service. He also recommends that the midshipmen should be sent to these hospitals for a period of instruction in navigation and general learning.

On February 26, 1811, the commissioners of naval hospitals were authorized to acquire sites, and to buy or build hospitals, and this same act requires one of these establishments to provide a permanent "asylum" for "decrepid and disabled naval officers, seamen, and marines."

"Asylum" is thus used in the first law upon the subject. It seems an unfortunate term, although truly expressing the intent of the charity.

In the year 1826, as has been said, Dr. Harris bought the asylum property, and the hospital at the navy-yard, on the Delaware, was abandoned, and the Pemberton mansion used instead; and continued in use until 1833, when the present asylum building was sufficiently finished for occupation.

In the records of the hospital from 1826 to 1833 appear the names, as patients, of Farragut, Bainbridge, Twiggs, Hull, Levy, Izard, Newell, Ogden, Howard, P. Voorhees, Engle, Mercer, and other well-known officers.

The government selected the Philadelphia Hospital as the one which was to be the "asylum" directed by the act of 1811; and from the correspondence, it is clear that Dr. Harris is responsible for the selection of the site upon the Gray's Ferry Road, it being already in possession and occupied for hospital purposes. He was detailed by the Secretary of the Navy to superintend the construction, receiving a certain sum, over and above his pay, therefor. Mr. Strickland, the architect, was associated with him in the superintendence.

In 1832 the asylum building was under roof; and up to this time the expense had been wholly borne by the "Naval Hospital Fund," which had become so drained that, in July of that year, a bill passed Congress appropriating $27,300 for "completing the navy asylum at Philadelphia," and $6600 for "fixtures, furniture, and apparatus." During the time the asylum was being built the naval hospitals at Chelsea, Brooklyn, Norfolk, and Pensacola were going up, under regular annual appropriations.

In this same year—1832—there was a transfer, by act of Congress, of all powers of commissioners of hospitals to the Secretary of the Navy. They were directed to turn over to him all cash and evidences of value previously held by them jointly for "the payment of navy and privateer pensions, and for expenditures on account of naval hospitals." The Secretary of the Navy was henceforth to keep this fund as sole commissioner, reporting annually to Congress, as he does to this day.

The asylum building, though by no means completed internally, was occupied toward the close of 1833. From that time until 1842 an aggregate of $93,000 was appropriated for the building, grounds, etc.

According to the report of the architect, the building cost $195,600, and adding the cost of the land brings the total to $212,600, of which four-ninths came from appropriations, and the rest from the hospital fund.

The building faces nearly east, and is constructed of a grayish-white marble, with a granite basement. It is 380 feet in length, and consists of a central building, with a high, broad flight of marble steps, and imposing abutments, and a marble colonnade and pediment, in the bastard classic style, which was the fashion at

the period of its erection, and which has fastened upon the country numbers of solid and costly buildings, utterly unsuited to our climate, and unsightly from lack of fitness.

The wings are symmetrical, and terminate in pavilions, or transverse buildings at each end. These wings are supplied with broad covered verandas on each of the two main floors, which are admirably adapted to their purpose, and, of course, entirely out of keeping with the classic central structure.

A fine attic and basement complete the building, which is most thoroughly and substantially constructed in every part. The marble staircases of the interior are especially noticeable from their ingenious construction and economy of space. The ceilings of two floors are vaulted in solid masonry, and there is a remarkably fine, lofty domed apartment, used as a muster-room and chapel.

The beneficiaries, as they are called, have each a small room, and the use of several reading- and smoking-rooms in the pavilions, beside which there are quarters for officers and employés.

When the asylum was first occupied four beneficiaries were transferred to it from the old building, as were the sick of the station.

The whole of the interior was not finished until 1848, when the increase in the number of inmates rendered it necessary. For many years —from 1840 to the close of the civil war—the second floor of the south wing and the rooms in the pavilion were used as the hospital proper. During the war much of the attic was also so used. For many years the beneficiaries were supported in the same way, and from the same fund as patients in hospital. In 1842 their number was 42, and in 1858 there were considerably over 100; and in the latter year the hospital fund was relieved by an appropriation "for support of beneficiaries, $26,392;" and ever since a separate and specific annual appropriation has been made for the same purpose. The annual appropriation, from the naval pension fund, is now about $60,000.

The first "Governor" of the Naval Asylum was Commodore James Biddle, who was appointed by Secretary J. K. Paulding, upon complaint and scandal resulting from the administration of an old lieutenant who had charge of the beneficiaries as "superintendent." The Secretary proposed to the commodore to take charge, with the title of "Governor," as adding dignity to the position. His appointment was dated August 1, 1838, and he remained until 1842, when he was relieved upon his own application. During his service the classes of midshipmen preparing for examination were placed at the asylum, with one or two professors to instruct them,—a partial fulfillment of Mr. Paul Hamilton's idea. They at first had the basement rooms at the north end, which were truly reported as being "damp, cold, cheerless, and unhealthy." Afterwards, through the energetic remonstrances of Lieutenant Foote, they were placed on the floor above. Here they remained until the Naval Academy at Annapolis was founded, in 1845.

About 1842, during the administration of Secretary Upshur, a division of the building into two parts was effected by a lath-and-plaster partition, one part being hospital and the other asylum. The partition ran through the centre of the hall, and the wings being precisely alike, afforded equal conveniences. This arrangement did not continue long, however.

During the late war the necessity for a separate naval hospital became evident, and a large and commodious building for that purpose was erected upon a portion of the grounds nearer the river.

During the early years of the asylum those who died there were buried to the north of the asylum, but the cutting of a street led to the bodies being removed to ground to the west. When the hospital was built it was found necessary to remove the bodies again, and they were transferred to a lot belonging to the government in Mount Moriah Cemetery, where all interments now take place.

At the Naval Asylum hundreds of old men who have deserved well of their country have passed their declining years in tranquillity and comfort, not unfrequently attaining a great age. The present number of beneficiaries ranges from 130 to 150, and they die about as fast as new ones come in. Under the regulations no one is eligible for the asylum who has not passed at least twenty years in the naval service, but exceptions are made in cases of serious disability in the line of duty.

Upon entering the asylum a beneficiary has to give up to the hospital fund any pension of which he may be in receipt. Each one has a separate room, and is furnished with three wholesome meals a day, a good allowance of clothing, free washing, and one dollar and one pound and a half of tobacco per month.

There is a good library for the use of the inmates, and pleasant reading- and smoking-rooms, with open fires, and tables covered with newspapers and periodicals. No restraint is placed upon their movements, within reasonable hours, so long as their conduct is marked with propriety, and the usual punishment for misconduct is confinement to the grounds for a few days.—*E. Shippen.*

Asymtote. A line which continually approaches a curve but never meets it.

Atabal. A Moorish drum.

Atagan. See YATAGAN.

A-taunt-o, or All A-taunt-o. Every mast an-end and fully rigged.

Ategar. An old English hand-dart.

Atherine. A silvery fish used in the manufacture of artificial pearls. It is also called *argentine.*

Athwart. Transversely; at right angles to the keel; across the line of the ship's course.

ATHWART HAWSE. A vessel, boat, or floating timber drifted across the stem.

ATHWART-SHIPS. From side to side; in opposition to fore-and-aft.

ATHWART THE TIDE. Across the tide.

Atlantic. The ocean which separates the New World from Europe and Africa, so named from the Atlas Mountains, in Africa. See OCEANS.

Atlantides. The daughter of Atlas; a name of the Pleiades.

Atlas. A book of maps or charts, so called from the character of that name in ancient mythology, represented as carrying the world on his back. The name was first applied to maps by Mercator, the famous geographer, in the 16th century.

Atmosphere is the name applied to the gaseous fluid which surrounds the earth. It exhibits, in common with all fluid bodies, the usual characteristics of hydrostatic pressure, but its internal condition differs from that of a liquid, inasmuch as its particles repel each other, and can only be held in proximity by external force. From this circumstance it follows that the volume of any portion of air varies much more under the influence of external pressure than that of an equal volume of water; hence the stratum of air nearest the earth is denser than strata in the upper regions, where, from their being subjected to the weight of a smaller mass of superincumbent air, the repulsive force of the particles has freer play.

Chemical Composition of the Atmosphere.

	Volumes.	Grains.
Nitrogen	79.02	76.84
Oxygen	20.94	23.10
Carbonic acid	0.04	0.06
	100.00	100.00

Besides the substances just named other gaseous matters occur, but in quantities so small as not sensibly to increase the bulk of the atmosphere.

Posidonius first calculated the height of the atmosphere, stating it to be 800 stadia, nearly agreeing with our modern ideas, about 79 B.C. Its weight was determined by Galileo and Torricelli, about 1643; its density and elasticity by Boyle; and its relation to light and sound by Hooke, Newton, and Derham. The composition of the atmosphere was ascertained by Hales, Black, Priestley, Scheele, Lavoisier, and Cavendish; and its laws of refraction were investigated by Dr. Bradley, 1737.

Atolls. An East Indian name for the coral formations known as lagoon-islands.

Atomizer. An instrument to reduce a liquid to a spray.

Atrie. To bring-to in a gale.

A-trip. The anchor is *a-trip* when it is just hove clear of the ground. Sails are *a-trip* when they are sheeted home, hoisted taut up, and ready for trimming. Yards are *a-trip* when they are hoisted up and ready to be swayed across. A mast is *a-trip* when the fid is out ready for lowering.

Attached. Belonging to. An officer is said to be attached to any ship or station to which he is ordered for duty.

Attack. To fall upon with hostile intent; to assail.

Atterage. (*Fr.*) A land-fall.

Attested. Legally certified.

Attile. An old law term for the furniture of a ship.

Attraction. The principle by which bodies mutually tend toward each other, distinguished into the attraction of *gravitation*, of *cohesion*, and *capillary*, *magnetic*, and *electrical* attraction.

Atween, or 'Tween. Between.

Atwixt, or 'Twixt. Betwixt.

Auckland. A town of New Zealand, on the Waitamata Inlet. Lat. 36° 50′ S.; lon. 174° 50′ E. It has two fine harbors. Auckland is the third port in the colony in the value of exports and imports. Pop. 12,000.

Audit. To settle or adjust an account.

Auditor, Fourth. Chief of a bureau of the Treasury Department, established in 1817. Previously an accounting clerk in the Navy Department. The Auditor's office receives the accounts of all paymasters of United States vessels, navy-yards, and navy pay offices, of navy pension agents, paymasters, and quartermasters of the marine corps, and other disbursing agents for the Navy Department, and passes upon the correctness and legality of their receipts and expenditures. All claims for pay, bounty, prize-money, traveling expenses, or other compensation for services in the navy and marine corps should be made to this office. All allowances by the Fourth Auditor are subject to revision by the Second Comptroller. An appeal may be taken to the Comptroller from an adverse decision of the Auditor, and the decision of the former is final, except with Congress and the United States courts. The Auditor is the custodian of all pay- and muster-rolls of officers, men, and mechanics on board ship or at navy-yards, from which the state of their accounts can be readily ascertained. He also preserves all vouchers for expenditures of money and stores; the papers in claims of all characters; and the original or copies of all letters received or written. Records are kept of all accounts rendered to the office, and the amounts allowed and disallowed thereon; of all claims received, and the disposition thereof; of all moneys drawn from or refunded to the Treasury by navy disbursing officers; of all transfers of money, clothing, and small-stores between pay officers; of the amount of money appropriated for each specific naval purpose and the expenditures therefrom; of prizes captured, the participants in the capture, and the amounts distributed to claimants, and remaining unclaimed; of all allotments of pay, amount paid to each allottee, and amount deducted from the pay of each allottee; and other records of the transactions of the office. It is the duty of the Auditor to prepare the accounts of delinquent pay officers for suit on their official bonds, and transmit the same to the Solicitor of the Treasury. The Auditor has no power to compromise claims of the United States against its debtors. The office consists of the Auditor, Deputy Auditor, and about 40 clerks, and is organized in divisions, as follows: paymasters' accounts, prize-money, general claims, navy pay accounts, bookkeeper's, records, and navy pensions.

Auges. Apsides.

Auget. A tube filled with powder for firing a mine.

Augmentation of the Moon's Diameter. The increase in apparent diameter, due to an increase of elevation.

Auk. A sea-bird of the *Alca* family.

Aulin. An Arctic gull (*Cataractes parasiticus*). It is called *dirty aulin* by the northern boatmen.

Aumbrey. An old term for a bread and cheese locker.

Aume. A Dutch measure for wine, containing 40 English gallons.

Auriga. A northern constellation, popularly known as the "Wagoner." *a Aurigæ*, Capella.

Aurora. The goddess of morning. The faint light which precedes the rising of the sun.

Aurora Borealis. The northern lights. A luminous meteoric phenomenon, supposed to be

of electrical origin. This species of light usually appears in streams, ascending toward the zenith from a dusky bank, a few degrees above the northern horizon. Sometimes it assumes a wavy appearance, and is then called the *merry-dancers*. The streams assume a variety of colors, from pale yellow to blood-red.

AURORA AUSTRALIS. The southern lights.

Auster. The south wind of the ancients.

Austral. Relating to the south.

Australia. See CONTINENTS.

Austral Signs. The last six of the zodiac.

Austrian Navy. The geographical position of this immense empire renders it next to impossible that it should either possess or require a large navy. When the territory extended over Lombardo-Venetia, the ports of Venice and Trieste were commanded by Austria, and the trade there carried on needed the protection of ships of war. But that extensive portion of the empire which was assigned to Austria by the treaty of Vienna, in the year 1815, was wrested from her in the year 1859, when France united with Sardinia to achieve the independence and unification of Italy under one monarch. Consequently her maritime possessions have dwindled to the Danube and the ports in Dalmatia, etc., and as the former has but one outlet to the Black Sea, which does not admit of vessels drawing many feet of water, Austria needs not many ships of war to protect her commerce. At the present moment, therefore, she possesses but 47 steamers and 17 ships of war, and as their united burden is only 93,270 tons, and they altogether mount no more than 365 guns, it may be conceived that they are for the greater part very small vessels. The entire annual cost of the navy and the establishments connected with it is rather above ten millions of florins. The trade which the navy shelters is limited to 35 ports in the Littoral provinces, 54 in Dalmatia, and 11 in Croatia.

Autan. Gusts of wind from the south

Automatic Fire. An explosive mixture of the Greeks, compounded of equal parts of sulphur, saltpetre, and sulphide of antimony finely pulverized and mixed into a paste with equal parts of the juice of black sycamore and liquid asphaltum, a little quicklime being added. The rays of the sun would set it on fire.

Autumn. The fall: the months of September, October, and November.

AUTUMNAL EQUINOX. The time when the sun crosses the equator, moving south.

AUTUMNAL POINT. That point on the ecliptic whence the sun descends southward.

AUTUMNAL SIGNS. Libra, Scorpio, and Sagittarius.

Auxiliary Screw. A screw with which a full-rigged vessel is sometimes supplied, to be used in calms, working to windward, entering port, etc.

Avast. Stop; cease. From the Italian *basta*.

Avenue. The inlet into a port.

Average. A rule was established by the Rhodian law, and has prevailed in every maritime nation, that where a loss has been sustained or an expense incurred, for the general safety of the ship and cargo, a contribution should be made, in proportion to their respective interests, by the owners of the ship, freight, and goods on board; or, in modern times, by the insurer of these. To this contribution the name of *general average* is given. Personal property of the passengers, not carried for the purpose of traffic, is not liable for any share in this contribution. See JETTISON.

PARTICULAR AVERAGE. The loss of an anchor, the leakage of a cask, the washing overboard of goods, etc., where the common safety was not in question, and where there is, consequently, no contribution.

PETTY AVERAGES are pilotage, anchorage duty, etc. If these occur in the ordinary course of the voyage they are not loss, but simply a part of the expenses necessarily incurred. But if they have occurred under extraordinary circumstances, and for the purpose of avoiding immediate danger, they are a loss, which is included in the *general average*, and covered by the contribution.

AVERAGE BOND is a deed which parties liable to a general average are in the habit of executing, by which they empower an arbiter to value the property lost, and fix the proportion which shall be borne by each proprietor.

AVERAGE ADJUSTER. A qualified person to adjust the loss, damage, and expense in consequence of an accident or misfortune.

AVERAGE AGREEMENT. A written document signed by the consignees of a cargo, binding themselves to pay a certain proportion of general average that may arise against them.

Avviso. An Italian advice-boat.

Awaft, or Awheft. The displaying of a stopped flag.

Await, Lying in. In ambush for the purpose of cutting off passing vessels.

Award. A judgment by arbitrators in maritime cases.

A-wash. At the surface of the water.

Away Off. At a distance, but in sight.

AWAY SHE GOES! The cry when a vessel starts on the ways in launching. An order to walk away briskly with a tackle.

AWAY THERE! The call for a boat's crew to man their boat; as, *away there, launches!*

AWAY WITH IT! An order to walk away briskly with a tackle.

A-weather. The position of the helm when the tiller is borne over to the weather side. When it is put over to the extreme limit it is *hard a-weather*.

Aweigh. The position of the anchor just after breaking ground.

Awkward Squad. A squad of raw recruits, or of men detailed for extra drill on account of their stupidity.

Awning. A canvas covering spread over the deck of a vessel to protect the crew from the sun and weather. The *forecastle* awning extends from the foremast forward. The *main-deck* awning is spread between the foremast and the mainmast. The *quarter-deck* awning is spread between the main- and mizzen-masts, and the *poop* awning extends from the mizzen-mast aft.

The *back-bone* is a rope stitched to the middle of the awning. It runs fore-and-aft, has a thimble in one end, and to the other is hooked the *fore-and-aft* tackle. The awning is hauled out at the corners by *earings*, and at the sides by *stops* and *bull-earings*.

The *ridge-rope* is a rope fore-and-aft the ship on both sides, forming a straight line from stem to stern, and is supported by the rigging and by wooden or iron supports called *stanchions*.

The *shark's-mouth* is an opening to accommodate the masts and stays abaft, and the *dog's-ear* is one of the irregularly-shaped corners thus formed. The *euphroe* is a block of wood through which is rove a combination of small lines called a *crowfoot*. To this is hooked the *crowfoot-halliards*.

The *lacing* is the line which draws together the ends of adjoining awnings.

AWNING- or SIDE-CURTAINS are strips of canvas set between the ridge-rope and the rail.

To GET THE AWNING ON A STRETCH. To haul it taut between the masts.

To SPREAD AN AWNING. To suspend it parallel with the deck by means of the fore-and-aft tackle, earings, and side-stops.

To HOUSE AN AWNING. To bring the edges close down to a *housing-line* near the deck, thus giving the canvas a greater angle and causing it to shed the water.

To TRICE UP AN AWNING. To hook whips to the earings and edges and hoist it up to dry. The whips are sometimes hooked to the backbone.

To FURL AN AWNING. To roll it up and pass stops around it.

Ax. A tool for chopping wood.

BROAD-AX, a carpenter's tool. It has a wider and thinner blade and a shorter handle than the ordinary ax.

BATTLE-AX. The ancient weapon had, sometimes, a double edge. The tool by this name now in use is simply a hatchet.

Axis. A straight line passing through a body upon which it revolves, or may be supposed to revolve.

AXIS OF THE EARTH. That diameter upon which the earth rotates diurnally from west to east. In consequence of this rotation the earth has assumed its present form,—an oblate spheroid, being compressed at the extremities of the axis (the poles), and bulging in the regions most remote from them (the equatorial). With reference to its extremities, the axis is called the "*Polar Diameter.*"

AXIS OF THE HEAVENS. That diameter about which the celestial concave appears to revolve diurnally from east to west. It passes through the observer's place, and is parallel to the axis of the earth, with which it is generally considered coincident.

Axle. The cross-piece of a gun-carriage, on the extremities of which the trucks revolve, which extremities are called the *arms* of the axle.

Aye. Yes. *Aye-aye*, the response of commissioned officers, not commanding or flag-officers, to the hail of the sentry. *Aye-aye, sir*, the usual response to denote that an order is understood and will be obeyed.

Aylet. The sea-swallow.

Ayont. Beyond.

Ayr. An open sea-beach. A bank of sand. The mediæval term for oar.

Ayt. See EYGHT.

Azimuth. The arc of the horizon intercepted between the meridian of the place and a vertical circle passing through the centre of any body. The *magnetic* azimuth is the arc of the horizon intercepted between the vertical circle and the magnetic meridian. The difference between the *true* and the *magnetic* azimuth is the *variation* of the compass.

AZIMUTH CIRCLE, a vertical circle, or great circle passing through the zenith and nadir.

AZIMUTH AND ALTITUDE. The horizon co-ordinates for defining points of the celestial concave in its diurnal revolution relatively to the position of an observer on the earth's surface.

AZIMUTH AND ALTITUDE INSTRUMENT. An instrument for taking azimuths and altitudes simultaneously. The telescope by which the observations are made is capable of motion in two planes at right angles to each other, and the amount of its angular motion in each is measured in two circles co-ordinate to each other, whose planes are parallel to those in which the telescope moves. In the azimuth and altitude instrument one of these planes is horizontal, the other vertical.

AZIMUTH, MOTION IN. An instrument is said to move "in azimuth" when it is turned on a vertical axis; in contradistinction, it is said to move "in altitude" when it is turned on a horizontal axis. An azimuth and altitude instrument admits of both motions.

AZIMUTH COMPASS. A compass specially adapted for observing bearings.

AZIMUTH DIAGRAM, GODFRAY'S. A diagram by means of which the true azimuth can be rapidly and simply obtained without calculation, the data being the *latitude*, the *sun's declination*, and the *apparent time*. The scale on which it is constructed gives the result to within one-eighth of a degree.

Azogue. Quicksilver. A Spanish ship fitted expressly to carry quicksilver.

Azumbal. A Spanish wine measure, eight of which make an arroba.

B.

B. Abbreviation for *before* in the U. S. General Service Code of Signals. In the log *b* denotes *blue sky*.

Baard. A mediæval transport.

Baas. A Dutch skipper.

Babbing. A method of catching crabs.

Babbitt Metal. A soft alloy of copper, zinc, and tin, used for the bearing of journals to diminish friction.

Bac. A French ferry-boat. A punt used by shipwrights for carrying tar, pitch, etc.

A broad flat boat for transporting carriages, cattle, etc., over streams by means of a rope stretched across.

Bacallao *(Sp.)*. Newfoundland and adjacent islands. The name is also applied to the codfish salted in Newfoundland.

Bache, Alexander Dallas, LL.D., A.A.S., physicist, born Philadelphia, Pa., July 19, 1806; died Newport, R. I., February 17, 1867. West Point, 1825. He was a great-grandson of Dr. Franklin, and his mother was the daughter of A. J. Dallas. He was a lieutenant of engineers until his resignation, in 1829. Engaged in constructing Fort Adams and other works at the entrance of Narragansett Bay. From 1827 to 1832 he was professor of mathematics in the University of Pennsylvania, and then took charge of the organization of Girard College, spending some time, in 1836, inspecting the great schools of Europe, publishing, upon his return, a valuable report on the subject. In 1839 he resigned his connection with this college, and became, in 1841, principal of the Philadelphia High School. In 1843 he was appointed superintendent of the U. S. Coast Survey. Its valuable contributions to geodetic and physical science are found in the annual reports of the survey, and in the proceedings of the Association for the Advancement of Science. He was one of the founders of the American Association for the Promotion of Science, took a prominent part in founding the American Academy of Science, was made president of the American Philosophical Society in 1855, and was an active and efficient member of the United States Sanitary Commission throughout the war of the Rebellion. The degree of LL.D. was conferred on him by the University of New York in 1836, by the University of Pennsylvania in 1837, and by Harvard University in 1851. He was made a regent of the Smithsonian Institution in August, 1846. In 1833 he edited Brewster's "Optics," with notes. He published "Observations" at the observatory of Girard College, 1840–45, 3 vols. 8vo, "Report of Experiments to Navigate the Chesapeake and Delaware Canal by Steam," Philadelphia, 1834, and contributed many valuable papers to the scientific journals of the day.

Back, Sir George, born at Stockport, England, November 6, 1796. In the year 1819 this British naval officer accompanied Sir John Franklin on his first Arctic voyage. Fourteen years later he was sent out on an expedition in search of Captain Ross, an Arctic navigator, and published an interesting account of his voyage. In 1839 he was knighted, and in 1867 he became an admiral.

Back. The outside or convex part of compass-timber. The outermost board of a sawn tree.

Back of a Ship. A figurative term for the keel and kelson. See Broken-backed.

Back of the Post. An additional timber bolted to the after part of the stern-post.

To Back an Anchor. See Anchor.

To Back a Ship at Anchor. To keep the chain taut by hoisting the mizzen-topsail. If the wind falls she should be hove a-peak.

To Back a Sail. To lay the yard so that the wind acts on the forward surface, and thus check or stop the headway.

To Back Water. To row in a direction contrary to the usual mode, so as to give a boat sternway.

To Back the Port or Starboard Oars. To back on one side and give way on the other, so as to round quickly.

To Back a Rope or Chain. To put on a preventer.

To Back the Worming. To fill the holidays between the worming and the rope, so as to give a smooth surface for the service.

The wind is said *to back* when it changes direction against the sun.

To Back and Fill. A method of working to windward with a weather tide in a narrow channel. The main object is to keep the ship in mid-channel broadside on to the current. The yards are counterbraced, or the sails are kept shivering. The ship is kept well under control by bracing the yards and giving her the jib and spanker as circumstances demand. To attempt this manœuvre a correct knowledge of the strength and set of the currents and the depth of the water is required.

Back Her! The order to reverse the engine and give the vessel sternway.

Back-board. A board across the stern-sheets of a boat to form the coxswain's box, and also to support the backs of the passengers.

Back-bone. The fore-and-aft rope stitched to the midship part of an awning.

Backer. A broad piece of sennit nailed around the yard inside of the sheave. It is fitted with an eye or a thimble, and the head-earing is rove through it.

Back-frame. The vertical wheel which turns the whirlers of a rope-winch.

Backing. The timber behind the armor-plates of a ship. See Armor.

Back-lash. The reaction or striking back of the moving parts of machinery when the power is not uniform or the load is variable.

Back-o'-beyond. Said of a great unknown distance.

Back-observation. A name applied to an observation in which the greatest distance of the heavenly body from the horizon is measured. It is so called because the back of the observer is turned to the object when its altitude is taken.

Back-pressure. The resistance of the atmosphere or waste steam to the piston.

Back-rope. A rope which fits over the dolphin-striker with a cuckold's neck and sets up to the bows on each side. See GOB-LINE.

Back-sight. The breech-sight of fire-arms.

Back-staff. An old navigating instrument invented in 1590; so named because the back of the observer was turned to the heavenly body when its altitude was measured. See BACK-OBSERVATION.

Backstays. Ropes which extend from all mast-heads—except the lower—to the ship's side or channels.

STANDING BACKSTAYS set up well aft and support the masts when the wind is abaft the beam.

BREAST-BACKSTAYS set up in the channels and support the masts when on the wind. They are not now in use.

BEAR ABAFT THE BREAST-BACKSTAYS! An order to come up the breast-backstays and bear them abaft, in order that the yards may be braced sharp up.

PREVENTER-BACKSTAYS. Additional supports to assist the backstays when carrying on.

TRAVELING-BACKSTAYS are fitted with a traveler, which moves up and down with the topsail-yard. The support is thus kept where it is most needed. They are not now in use.

TO BACKSTAY A YARD. To brace it up as far as the backstays will permit.

Backstay-plates. Plates to which the backstays set up.

Backstay-stools. Small detached channels fixed abaft the principal ones, to which the standing backstays set up. They are introduced in preference to extending the channels.

Back-strapped. A ship with a wind fair, but so light as not to enable her to stem the current, is said to be *back-strapped.*

Back-sweep. That which forms the hollow of the top-timber of a frame.

Back-wash. See WASH.

Back-water. Water thrown back by the turning of a paddle-wheel or propeller. Water held by a dam or reservoir. The smooth water free from current in a small stream which runs into a large stream. It is caused by the rising of the water in the main stream.

Baculite. A genus of fossil shells of a straight form, a little conical, and in their cellular structure resembling the ammonites.

Badderlock. The *Fucus esculentus*, a kind of edible sea-weed.

Badge, Good-conduct. Any enlisted man holding a continuous-service certificate, who is distinguished for obedience and sobriety, and is proficient in seamanship and gunnery, shall receive, upon the expiration of his enlistment, a good-conduct badge; after he has received three such badges, under three consecutive re-enlistments, within three months from the dates of his discharge, he shall, if qualified, be enlisted as a petty officer, and hold a petty officer's rating during subsequent continuous re-enlistments; and shall not be reduced to a lower rating except by sentence of a court-martial.

Badge, Quarter. False quarter-galleries. A carved ornament on a vessel's quarter, containing a window or a representation of one.

Badger. To worry; to nag.

Badger-bag. The burlesque Neptune, who boards the ship on crossing the line.

Badger Whiskers. In 1841, Hon. George E. Badger, Secretary of the Navy, issued a general order regulating the uniform of the navy, in which was a clause requiring that no part of the beard should be worn long except the whiskers, and that they should not descend more than one inch below the tips of the ears, and thence in a line with the corners of the mouth. These were nicknamed "Badger Whiskers." Fashion, however, proved more powerful than the regulation, and the order was never fully enforced.

Baessy. The old name of a gun, afterwards called *base.*

Baffin, Wm., born in 1584. Engaged with Jas. Hall in Arctic investigations begun in 1612; this navigator discovered the gulf which communicates with the North Atlantic Ocean by Davis' Strait, and he earned immortality by giving the gulf the name of Baffin's Bay, in 1616; was killed at the siege of Ormuz, May 23, 1622.

Baffling. A light breeze, which is continually hauling and veering, is said to be *baffling.*

Bag. A pouch or sack to hold or convey anything. The bag in which the sailor's clothing is stowed is made of canvas painted black, with the owner's name and ship's number plainly stenciled thereon.

WHAT IS THE NUMBER OF YOUR BAG? Jack's facetious inquiry addressed to a comrade starting out on perilous duty from which he may never return. The saying originated from the habit seamen formerly had of going through a dead comrade's bag before his effects could be sold at auction.

DITTY-BAG. A small bag to hold sewing-gear, shaving-tackle, etc.

MONK-BAG. A small purse, which sailors wear strung around their neck, to contain their valuables. So named from the habit monkeys have of stowing away food in their cheeks.

BAG AND BAGGAGE. The whole movable property.

BAG OF THE HEAD-RAILS. The lowest part or sweep of the head-rails.

TO BAG ON A BOWLINE. To be leewardly. A sail is said *to bag* when, the leeches being taut, there is a great deal of slack canvas in the sail. Formerly sails were so cut intentionally, the idea being that they would catch more wind. Sails are now cut so as to set as flat as possible.

Bagala. A two-masted Arab boat, used both for commerce and for piracy. They are from 50 to 300 tons burden, and sail with great rapidity.

Baggety. The lump or sea-owl (*Cyclopterus lumpus*).

Baggonet. An old term for bayonet, and not a vulgarism.

Baghela. A Muscat one-masted vessel, 200 to 300 tons burden.

Bag-net. A fishing-net shaped like a bag.

Bagnio. A barrack for galley-slaves and convicts.

Bagpipe. To bagpipe the mizzen is to lay it

aback by bringing the sheet to the mizzen rigging.

Bag-reef. The lower reef of fore-and-aft sails; the upper reef of topsails.

Bagrel. A minnow or baggie.

Baguio. A rare but very violent wind among the Philippine Islands.

Bahar. A weight used in the East Indies, varying considerably in different localities, ranging from 223 to 625 pounds.

Bahia. A city and seaport of Brazil, situated in an elevated position on the strip of land forming the E. side of the entrance to All-Saints Bay, immediately within Cape San Antonio, on which is a revolving light 140 feet above sea-level; in lat. 13° 0′ 42″ S., lon. 38° 31′ 42″ W. It is 800 miles N.N.E. of Rio de Janeiro.

The harbor is one of the best in America, and is suitable for vessels of any size. The commerce consists chiefly in the export of sugar, cotton, tobacco, coffee, etc. The whale-fisheries of this city were once the greatest in the world, and large numbers of whales are still caught in the neighboring waters. Pop. 140,000.

Baidar. An Arctic canoe used for pursuing otters and even whales. It consists of a frame 18 to 25 feet long, covered with hides, and is impelled by 6 to 12 paddles.

Baikie. A name for the *Larus marinus*, or black-backed gull.

Bail. A surety. The cargo of a captured or detained vessel is not allowed to be taken on bail before adjudication except by mutual consent. To lade water out of a ship or boat with buckets (which were of old called *bayles*), cans, or the like.

Bail-bond. The obligation entered into by sureties. In prize matters the bail-bond is not a mere personal security given to the individual captors, but an assurance to abide by the adjudication of the court.

Bailey, Theodorus, Rear-Admiral U.S.N. Born in New York, and appointed midshipman from that State, January 1, 1818. Commissioned as lieutenant, March 3, 1827; receiving-ship, at New York, 1829; sloop "Vincennes," Pacific Squadron, 1834–36; special duty, 1837; navy-yard, New York, 1840; frigate "Constellation," East India Squadron, 1843; rendezvous, New York, 1846; commanding store-ship "Lexington," 1847–48. While in command of the store-ship "Lexington," during the Mexican war, rendered efficient and valuable aid to the commander of the Pacific Squadron by his energy, enterprise, and gallantry in fitting out and leading numerous expeditions against the enemy.

Commissioned as commander, March 6, 1849; commissioned as captain, December 15, 1855; commanding sloop-of-war "St. Mary's," 1856–57; commanded frigate "Colorado," Western Gulf Blockading Squadron, 1861–62.

Captain Bailey was Farragut's second in command in the battle at New Orleans, and led the attack and passage of the forts. He was officially commended by Admiral Farragut for his bravery and ability, and further complimented by being sent to Washington as the bearer of dispatches, announcing the victory. Commissioned as commodore, July 16, 1862.

Commodore Bailey, although his health was seriously impaired, asked for active duty, and in the fall of 1862 was ordered to command the Eastern Gulf Blockading Squadron, where he displayed great energy and perseverance in his successful attempt to break up blockade-running on the Florida coast. Commandant Portsmouth navy-yard, 1865–67.

Commissioned as rear-admiral, July 25, 1866. On special duty at Washington, D. C., 1867–70. Died 1876.

Bails. The frame which supports the canopy spread over the stern-sheets of a boat.

Bainbridge, William, Commodore U.S.N. Born in Princeton, N. J., May 7, 1774; was the son of Dr. Absalom Bainbridge, a leading physician of New York. His maternal grandfather was John Taylor, Lord High Commissioner of New Jersey under the crown. Bainbridge made his first cruise in the frigate "Alliance," then sold out of the navy and engaged in the India trade. When 18, he sailed as first mate of a vessel, and when 19, was made her commander. Appointed a lieutenant-commandant in the navy in 1798, and given command of the "Retaliation," 14. Captured off Guadaloupe by the French frigates "Insurgente" and "Le Volontier." Promoted to master commandant and given command of the "Norfolk," 18. Captured several French privateers. Promoted to captain in 1800, when 26 years old. Took the "George Washington," 28, to Constantinople with tribute-money from the Dey of Algiers, and was the first to show our flag in Turkey. Commanded next the "Essex," 32, in the Mediterranean. Next took command of the "Philadelphia," 38, joining the squadron of Commodore Preble. Captured the Moorish pirate "Meshboha," 22. While blockading Tripoli harbor, October 31, 1803, the "Philadelphia" grounded on a reef not laid down in the chart, and the vessel was captured by the Tripolitans, her commander, officers, and crew suffering imprisonment until the end of the Tripolitan war,—June, 1805. Made several cruises in the merchant service during the peace that followed. In December, 1808, hoisted his broad-pennant in the "President," 44, remaining in her until May, 1810. Sailed again in the merchant service until 1812, when war with England became imminent. It was the temper of the government to lay up our navy during this war, but by the earnest protest of Bainbridge and Stewart this terrible blunder was avoided. Commanded the Charlestown navy-yard until the declaration of war,—June 18, 1812. He relieved Hull in command of the "Constitution," 44, September 15, 1812. Ran down the coast of Brazil, and when in lat. 13° 6′ S. and lon. 31° W., she fell in with and captured the English frigate "Java," 38. The "Constitution" went into action and came out with royal yards across, and without losing a spar. The "Java" was reduced to a mastless wreck, too much injured to be taken into port. The "Constitution" had 9 killed and 25 wounded. Bainbridge was seriously shot with a musket-ball, and hurt by a splinter from the wheel. The "Java" had 124 killed and wounded. Her captain—Lambert—was fatally injured. Among the prisoners taken was Lieutenant-General Hislop, bound to Bombay as governor. Men and officers were released on parole at San Salvador. Reached Boston February 27, 1813, Bainbridge relinquishing her command. For this action he received a gold medal from Congress. Com-

manded the Charlestown navy-yard until the end of the war. Commanded the Mediterranean Squadron in 1815, his flag-ship being the "Independence," 74, and again in 1819, his flag-ship in this instance being the "Columbus," 80. Returned home in 1821, and was made a navy commissioner. Commanded the Philadelphia navy-yard. Died in Philadelphia, July 28, 1833, aged 59 years and 3 months. He married Susan Heyliger, granddaughter of Captain-General Heyliger, governor of the Dutch West Indies. His youngest daughter married Rear-Admiral Henry Kuhn Hoff, of the navy, and his grandson, William Bainbridge Hoff, is still in the service.—*Wm. Bainbridge Hoff, Lieutenant-Commander U.S.N.*

Bait. The charge of a hook to allure fish.

Baitland. An old word used to signify a port where refreshments could be procured.

Bala-chong. A kind of cake formed of small fishes pounded up with salt and spices and then dried. It is much esteemed in China as a condiment for rice, etc.

Balæna. The zoölogical name for the right whale.

Balaklava. A town of Russia, in the Crimea, on the Black Sea. Lat. 44° 29′ N.; lon. 33° 34′ 40″ E. It has an excellent port. Pop. 742.

Balance. To contract a sail into a narrower compass;—this is peculiar to the mizzen of a ship, and to the mainsail of those vessels wherein it is extended by a boom. The operation of balancing the mizzen is performed by lowering the yard or gaff a little, then rolling up a small portion of the sail at the peak or upper corner, and lashing it about one-fifth down towards the mast. A boom mainsail is balanced by rolling up a portion of the clew, or lower aftermost corner, and fastening it strongly to the boom.

Balance-fish. The hammer-headed shark (which see).

Balance-frames. Those frames or bends of timber, of an equal capacity or area, which are equally distant from the ship's centre of gravity.

Balance of Power. An expression used in diplomacy for that state of matters in which no one of the European states is permitted to have such a preponderance as to endanger the independence of the others.

Balance of Trade. The term commonly used to express the difference between the value of the exports from, and the imports into, a country. The balance is said to be favorable when the value of the exports exceeds that of the imports, and unfavorable when the value of the imports exceeds that of the exports.

Balance-reef. To *balance-reef* a sail is to reduce it to its last reef, generally applied to fore-and-aft sails.

Balance-reef-band. A reef-band that crosses a spanker or trysail from the head-earing to the tack diagonally, making it nearly triangular, and is used to contract it in very blowing weather. A balance-reef-band is generally placed in all gaff-sails; the band runs from the throat to the clew, so that it may be reefed either way,—by lacing the foot or lower half; or by lacing the gaff dropped to the band: the latter is only done in the worst weather.

Balance, Steam. The ordinary safety-valve (which see).

Balancing-point. A familiar term for centre of gravity.

Balandra. A Spanish pleasure-boat. A lighter, a species of schooner.

Balanus. The acorn-shell. A sessile cirriped.

Balcar, or Balcor. See Balkar.

Balch, George B., Rear-Admiral U.S.N. Born in Tennessee, January 3, 1821. Appointed from Alabama, December 30, 1837; attached to sloop "Cyane," Pacific Squadron, 1840; Naval School, Philadelphia, 1843.

Promoted to passed midshipman, June 29, 1843; special duty, 1845; in war with Mexico, November 1, 1846, engaged in first attack on Alvarado by squadron under Commodore Connor; engaged in active operations from May, 1846, to surrender of Vera Cruz, March, 1847; in Mosquito Fleet, under Commodore Tatnall, covered the landing of the army under General Scott, March 9, 1847; at the time acting master of the "Falcon"; March, 1847, engaged in the joint bombardment of Vera Cruz with the army, and was present at the surrender of that city and the Castle of San Juan d'Ulloa to the military and naval forces; steamer "Princeton," Mediterranean Squadron, 1847–48; Naval Observatory, Washington, 1849–50.

Commissioned as lieutenant, August 16, 1850; sloop "Plymouth," Pacific Squadron, 1851–54; while in the "Plymouth," Lieutenant Balch, in command of the advance post at Shanghai, China, was wounded in the hip in a fight between the rebels and Imperialists; navy-yard, Washington, 1855–57; sloop "Jamestown," Home Squadron, 1857–58; sloop "St. Mary's," Pacific Squadron, 1858–59; frigate "Sabine," 1860; while in the "Sabine," fell in with the transport "Governor" and rescued nearly 400 marines, under Lieutenant-Colonel Reynolds, the transport sinking under the "Sabine's" stern, November 24, 1861; in command of steamer "Pocahontas," South Atlantic Squadron, 1861–62; volunteered for command of boats in taking possession of Tybee Island, December 26, 1861.

Commissioned as commander, July 16, 1862; engaged rebel battery at Stono, South Carolina; in August, 1862, ascended Black River the distance of seventy-five miles, and drove rebel battery from earth-works, and engaged rebel infantry on the bluffs; commanding steamer "Pawnee," South Atlantic Blockading Squadron, 1863–65; July 16, 1863, was attacked by two batteries, the rebels making a simultaneous attack on General Terry's forces. They were repulsed, and Commander Balch was informed by General Terry that he had saved his command. The "Pawnee" was struck forty-six times. On December 25, 1863, the "Marblehead" was opened on by rebel batteries; the "Pawnee" took an enfilading position in the Keowah River, and demoralized the enemy and caused him to retreat; afterward captured two rebel guns. While in command of the "Pawnee," Commander Balch engaged in the combined operations of the naval forces under Rear-Admiral Dahlgren, and the army under General Foster, in Stono River, South Carolina, from July 3 to 11, 1864, and particularly in the bombardment of Battery Pringle, on James Island, South Carolina. On February 9, 1865, having with him the "Sonoma" and "Daffodil," he ascended the Togoda Creek, North Edisto, South Carolina, and engaged three rebel

batteries of eleven or twelve guns, driving the rebels from their earth-works. The "Pawnee" was hit ten times, the "Sonoma" twice, and the "Daffodil" twice; navy-yard, Washington, 1866–68.

Commissioned as captain, July 25, 1866; commanding flag-ship "Albany," N. Atlantic Squadron, 1868–69; navigation duty, Washington, 1870–71; navy-yard, Washington, 1872.

Commissioned as commodore, August 13, 1872; Governor Naval Asylum, Philadelphia, 1873–76; member Light-House Board, 1877–78; promoted to rear-admiral, 1878; superintendent of Naval Academy, 1879–80.

Balcony. The projecting open galleries of old line-of-battle ships' sterns.

Baldrick. A leathern girdle or sword-belt. Also the zodiac.

Baldwin, Charles H., Commodore U.S.N. Born in New York, September 3, 1822. Appointed from New York, April 24, 1839; attached to frigate "Brandywine," Mediterranean Squadron, 1839–40; sloop "Fairfield," Mediterranean Squadron, 1840–43; sloop "Vandalia," 1843–44; Naval School, Philadelphia, 1844–45.

Promoted to passed midshipman, July 2, 1845; frigate "Congress," Pacific Squadron, 1845–49; war with Mexico; operations in the neighborhood of Mazatlan during the time that place was in possession of the United States naval forces, from November, 1847, to June, 1848; two engagements with the enemy.

Commissioned as lieutenant, November, 1853; resigned, February 28, 1854; re-entered the service as lieutenant, 1861; commanded steamer "Clifton" at the passage of Forts Jackson and St. Philip, and capture of New Orleans, also at first attack on Vicksburg, 1862.

Commissioned as commander, November 18, 1862; commanding steamer "Vanderbilt"; special service, 1863–64; ordnance duty, Mare Island navy-yard, California, 1864–67; fleet-captain, North Pacific Squadron, 1868–69.

Commissioned as captain, 1869; Inspector of Ordnance, Mare Island, California, 1869–71; commanding "Colorado," Asiatic Squadron, 1871–73; commanding naval rendezvous, San Francisco, 1873.

Commissioned as commodore, August 8, 1876; member Board of Examiners, 1876–79.

Bale. A pack or bundle.

BALE-GOODS. Goods or merchandise done up in bales.

Baleen. The scientific term for the whalebone of commerce, derived from *balœna*, a whale. It consists of a series of long horny plates growing from each side of the palate in place of teeth. These plates are 10 to 15 feet in length, and about a foot in width at the base.

Bale-fire. A beacon-fire.

Balenot. A porpoise or small whale, which frequents the river St. Lawrence.

Balestilha. The cross-staff of the early Portuguese navigators.

Balinger, or Balangha. A kind of small sloop or barge; small vessels of war, formerly without forecastles. A trading-boat of the Philippines and Moluccas.

Balistes. A genus of ganoid fishes, characterized by their solid coat of mail extending over the head as well as the body. Commonly called *trigger-fish.*

Balit. A one-masted vessel of Muscat, from 100 to 200 tons burden.

Balize is on the Bay of Honduras, at the mouth of the river Balize. Lat. 17° 29′ 18″ N.; lon. 88° 12′ W. The anchorage is safe and the harbor spacious. The chief trade is in mahogany. Exports and imports about $1,000,000 per annum. Pop. 4000.

Balk. Young trees felled and squared. A beam of timber used for temporary purposes, and under eight inches square. Timbers, squared, of any size, intended for planks, or, when very large, for booms or rafts.

Balkar. A man placed on an eminence to watch the movements of shoals of fish. In early statutes he is called *balcor.*

Ball. A round body or globe. A solid shot or bullet discharged from a cannon or other gun. Formerly the word ball in its military sense sufficiently described the projectiles of fire-arms, as nothing but round solid substances, such as stone, iron, or lead, were so employed. With the introduction of the mortar, however, which was probably not long after the invention of cannon, irregularly-shaped pieces of stone or metal came to be used, and at the siege of Naples by Charles VIII., in 1435, we first hear of shells or hollow shot being used. The word, therefore, as applied to the projectiles of fire-arms is not now inclusive of all the projectiles used, but only of a class. See BULLET, SHELL, SHOT.

Ball, with a prefix more or less descriptive of its purposes, such as fire-ball, stink-ball, etc. (for which see separate headings), denotes pyrotechnical compositions, or missiles filled with mal-odorous matter.

BALL AND SOCKET. A joint, of which the inner part is formed like a ball and the outer part is a hollow socket, inclosing the greater portion of the ball, and fitting close upon it, but allowing freedom of motion in every direction.

TO BALL OFF. To wind up into a ball; as, rope-yarns.

Ballahou. A fast-sailing schooner, common in Bermuda and the West Indies. The foremast rakes forward and the mainmast aft; hence the term ballahou is sometimes applied to men-of-war in which the masts are not kept properly stayed, or which are slovenly in other respects.

Ballarag. See BULLYRAG.

Ballast. A heavy substance employed to give a ship sufficient hold on the water to give her stability. The amount of ballast depends not only on the ship's size and cargo, but also on her build. It is not merely the *weight* of ballast which the mariner has to consider; he is required to take into account its *distribution. To ballast* a ship is the act of disposing the ballast so that the ship will maintain her proper equilibrium, and be neither too *stiff* nor too *crank.* If she be too stiff she will sail sluggishly, and her masts will be endangered by her violent rolling. If she be too *crank* she will be unable to carry sail without the danger of capsizing. Stiffness is occasioned by stowing the ballast well down, which brings the centre of gravity very near the keel. Crankness, on the other hand, is occasioned by raising the centre of gravity too high.

The object, therefore, is to so place the ballast, neither too high nor too low, neither too near the head nor too far aft, that the ship may be

brought down so that the surface of the water will be brought nearly to the extreme breadth amidships.

The cargo and ballast are considered together, the quantity and distribution of the latter being made dependent upon the former. In a man-of-war the ballast is permanent, and is made subservient to the guns and other top-weights she is required to carry. The substances used as ballast are various, chiefly iron, stone, gravel, sand, mud, and water.

A ship is said to be *in ballast* when she carries no weight except the ballast, crew, passengers, provisions for, and baggage of, crew and passengers.

To LOSE ONE'S BALLAST is to become top-heavy from conceit.

To HEAVE or SHOOT BALLAST is to dump mud or gravel ballast overboard. In order to prevent the filling up of harbors and channels certain regulations have been made at most maritime places for the disposal of ballast. The ballast is said to *shift* when from violent rolling it is removed from its original position.

BAG-WATER BALLAST is contained in water-proof bags laid upon the floor of a vessel, and filled or emptied by means of a pump and hose.

BOTTOM-WATER BALLAST is confined beneath a false bottom in the vessel.

HOLD-WATER BALLAST is contained in a large receptacle, which may be filled with cargo when the ship is not in ballast.

PIG-IRON BALLAST is supplied to men-of-war. It has the great advantage of taking up but little space.

SHINGLE BALLAST is composed of coarse gravel.

TANK-WATER BALLAST is contained in two fore-and-aft tanks, which can be easily filled and emptied by means of a pump.

Ballastage. A duty paid for taking up ballast from a port.

Ballast-basket. A basket made of osier for the measure and transport of ballast.

Ballast-lighter. A large flat-floored barge, for heaving up and carrying ballast.

Ballast-mark. The horizontal line described by the surface of the water on the body of a ship, when she is immersed with her usual weight of ballast on board.

Ballast-master. A person appointed to see the port-regulations in respect to ballast carried out.

Ballast-ports. Square holes cut in the sides of merchantmen for taking in ballast.

Ballast-trim. Trim when in ballast.

Ballatoon. A sort of long heavy luggage-vessel of upwards of a hundred tons, employed on the river between Moscow and the Caspian Sea.

Ball-cartridge. See CARTRIDGE.

Ball-clay. Stiff clay brought up by the flukes of the anchor.

Ballistic Pendulum. An instrument invented by Robins for measuring the force or velocity of cannon- and musket-balls. To one extremity of an iron bar was fixed a heavy cubical block of wood, lined at the back with iron. A transverse bar of iron at the other extremity of the first bar served as an axis of suspension, in which the pendulum swung freely, backwards and forwards. In order to measure the extent of the vibration which the pendulum made after receiving the impact of the projectile, a ribbon was attached to the lower end of the pendulum, passing loosely through an orifice in a horizontal bar in the frame-work; when the pendulum was raised it drew the ribbon along with it, and the quantity which thus passed through the orifice measured the chord of the arc of vibration. The instrument now used consists of a case or mortar of cast iron, partly filled with sand-bags or block-lead, suspended by wrought-iron bars from an axis working on knife-edges on V-supports, and the arc of vibration is measured on a copper arc by an index carrying a vernier. If such a pendulum, when at rest, be struck by a body of a known weight, and the vibration which the pendulum makes after the blow be known, the velocity of the striking body may thence be determined. The quantity of motion of the projectile before impact is equal to that of the pendulum and projectile after impact. See ELECTRO-BALLISTICS, GUN PENDULUM.

Ballistics. The art or science of throwing weapons by means of engines.

Balloen. A Siamese state-galley built to imitate a sea-monster, and pulling seventy to a hundred oars of a side.

Ballon. A brigantine-rigged vessel used in Siam, and made of a single tree.

Balloon. A bag of silk or other fabric filled with gas specifically lighter than the atmosphere, and hence deriving a tendency to ascend.

Balloon-fish. A fish of the genus *Diodon*, having the power of inflating its body until it becomes almost globular.

Balloon-jib. See JIB.

Ballot. To bound from side to side; as, a shot in the bore of a gun.

Ballow. Deep water inside a shoal or bar.

Bally. A Teutonic word for *inclosure*, now prefixed to many seaports in Ireland, as Ballycastle, Ballyhaven, etc.

Balsa (*Sp.*). 1. A pool; a lake. 2. A raft, or float, for conveying goods or persons across a river. It seems probable that the original signification of a pool or lake was converted into the means employed to cross lakes or rivers. On the west coast of South America balsas are made of bullocks' hides sewn together over a frame-work in two cylinders joined together, not unlike in form to the jaw-bone of a horse. Another kind of balsa is made of several pieces of an extremely light wood, sharpened at the ends and lashed together, with transverse slats to hold them singly in position. Both these means were employed centuries ago for landing in the surf. The same primitive arrangement of the second kind, using a sail, is the fishing-boat met far out of sight of land on the coast of Brazil. The general acceptation of the word on this continent is either two or more inflated bags of india-rubber, or long casks of metal or wood secured together in pairs, held some distance apart by a frame-work, or logs of light wood held together as before described, usually employed where the surf is heavy. 3. Any form of flotation capable of propulsion not designed for temporary use, differing from a raft in that the latter is a mere temporary expedient. See LIFE-BOATS and LIFE-RAFTS.—*Daniel Ammen, Rear-Admiral U.S.N.*

Baltheus Orionis. The three bright stars constituting Orion's Belt.

Baltimore, a city and port of entry of Maryland, is on the estuary of the Patapsco River, 12 miles from its entrance into Chesapeake Bay, and 250 miles by ship-channel from the sea. Lat. 39° 17′ N.; lon. 76° 37′ W. The harbor is spacious and secure. The facilities for the transfer of freight from the railways to the shipping are excellent, and in recent years the city has become one of the leading places of export in the United States. Steamship lines connect it with Liverpool, Bremen, and the principal domestic ports. Pop. 330,000.

Balusters. The ornamental pillars of the balconies or galleries of ships.

Bamba. A commercial shell of value on the Gold Coast of Africa.

Bamboo. A plant of the family of grasses, and genus *Bambusa*, growing in tropical countries. *Bamboo arundinacea* has a round, straight, hollow, woody, jointed stem; it grows to the height of forty feet and upward. Old stalks are five or six inches in diameter, and are so hard and durable that they are used in the manufacture of agricultural implements, and in building houses and ships. Bamboo is in general use in China for masts of junks, hence the pidgin-English expressions, "two piecee bamboo" and "three piecee bamboo" for brig-rigged and full-rigged vessels.

Bamboozle. To deceive; to play low tricks upon. To decoy the enemy by hoisting false colors.

Banana. A species of the genus *Musa* and its fruit.

Band. An iron hoop around a mast or yard. A company of musicians allowed to a ship or navy-yard. See Reef-band, Roband.

Bandsman. A member of the band.

Master of the Band. The leader of the band.

Bandage. A fillet, roller, or swath used in dressing wounds.

Bandala. The fibre from which the Manilla white rope is made. It is an outer layer of the abaca, a variety of the plantain. See Rope.

Bandaleer, or Bandoleer. A large leathern belt thrown over the right shoulder and dangling under the left arm, worn by ancient musketeers for sustaining their musket. A small leather case, of which every musketeer wore twelve, suspended by a belt.

Banded-drum. See Grunter.

Banderole. A small streamer or banner carried at the mast-head of a vessel, or at the end of a pike or lance.

Band-fish, or Ribbon-fish. A popular name of the *Gymnetrus* genus.

Bandle. An Irish measure of two feet.

Bang. An astringent and narcotic drug made from the large leaves and capsules of the wild hemp (*Cannabis Indica*). A mixture of opium, hemp-leaves, and tobacco, of an intoxicating quality, chewed and smoked by the Malays and other people in the East.

Bange. Light, fine rain.

Bangkok, capital of Siam, on the Menam, 20 miles from its mouth. Lat. 13° 38′ N.; lon. 100° 34′ E. Steamers ply hence to Singapore and Hong Kong. Value of exports in 1877, $8,200,000; of imports, $7,500,000. Vessels of 250 tons come up to the town. Pop. 500,000.

Bangles. The hoops of a spar. The rings on the wrists and ankles of Oriental people, chiefly worn by females.

Bangor. A city and port of entry in Maine, on the right bank of the Penobscot River, about 60 miles from the ocean. Lat. 44° 48′ N.; lon. 68° 47′ W. It is the head of navigation on the Penobscot River, which traverses extensive forests of pine, cedar, etc. The average quantity of lumber shipped annually from Bangor is about 200,000,000 feet. Pop. about 23,000.

Banian. A sailor's colored frock.

Banian-, or Banyan-days. A cant term among sailors to denote those days on which meat does not form a part of the ration. The term is derived from a religious sect in the East who never eat flesh.

Banian-, or Banyan-tree. The India fig-tree (*Ficus Indica*). The tendrils from the branches take root on reaching the ground, and form new stocks, till they cover a space of an acre or more. Religious rites, from which women are excluded, are there performed.

Banjo. The brass frame in which a screw-propeller is hung.

Bank. The border or margin of a river or lake. A shoal composed of sand, mud, or gravel. A seat or bench for rowers in a galley. The common galleys had 25 banks on each side, with one oar to each bank, and four men to each oar. The galeasses had 32 banks on a side, and six or seven rowers to each bank. See Galley.

To Double-bank an Oar is to set two men to pulling one oar.

A Single-banked Boat is one in which a thwart is occupied by one man.

A Double-banked Boat is one in which two rowers sit on the same thwart.

Banka. A canoe of the Philippines consisting of a single piece.

Banker. A vessel engaged in the cod-fishery on the banks of Newfoundland.

Bankerk, Joseph van Trappen. A Dutch admiral, born at Flushing about 1590; fought in the battle of Dunkirk, and defeated the Portuguese fleet near Brazil in 1647. Died on his voyage home the same year.

Bank Fires. To allow the fires in the furnace to burn down low, and then cut off the supply of oxygen by covering the fires with ashes and closing the doors of the furnace and ash-pit. By this means fuel will be saved, and in an emergency fires can be spread and steam generated with great rapidity.

Bank-harbor. A harbor protected from the violence of the sea by banks of sand, mud, or gravel.

Bankhead, John Pine, Captain U.S.N. Born in South Carolina, August 3, 1821. Entered as a midshipman August 6, 1838, became a passed midshipman in 1844, a lieutenant in 1852, a commander in 1862, and a captain in 1866. Died at Aden, Arabia, April 27, 1869. In command of the gunboat "Pembina," November 7, 1861, at the battle of Port Royal, and subsequent operations on the coast of South Carolina. In command of the original "Monitor" when she foundered off Cape Hatteras, December 31, 1863.

Bank-hook. A large fish-hook laid baited in running water with line attached to the bank.

Banking. A general term applied to fishing on the great bank of Newfoundland.

Banksal, or Banksaul, and in Calcutta spelled

bankshall. A shop, office, or other place, for transacting business. A square inclosure at the pearl-fishery. A beach store-house wherein ships deposit their rigging and furniture while undergoing repair. A place where small commercial courts and arbitrations are held.

Bannag. A name for a white trout; a sea-trout.

Bannak-fluke. A name of the turbot, as distinguished from the halibut.

Banner. A small square flag edged with fringe.

Bannerol. A little banner or streamer.

Bannock. A name given to a certain hard ship-biscuit.

Banstickle. A diminutive fish, called also the three-spined stickle-back (*Gasterosteus aculeatus*).

Baptism. A ceremony practiced on sailors and passengers on their first crossing the equator: a riotous and ludicrous custom, which from the violence of its ducking, shaving, and other practical jokes, is becoming annually less in vogue. It is esteemed a usurpation of privilege to baptize on crossing the tropics.

Bar. A boom formed of huge trees, or spars lashed together, moored transversely across a port, to prevent entrance or egress. The short bits of bar-iron, about half a pound each, used as the medium of traffic on the Negro coast. An accumulated shoal or bank of sand, shingle, gravel, or other uliginous substances, thrown up by the sea to the mouth of a river or harbor. The shore on which the deposition of sediment is taking place will be flat, whilst the opposite one is steep. It is along the side of the latter that the deepest channel of the river lies; and in the line of this channel, but without the points that form the mouth of the river, will be the *bar*. If both the shores are of the same nature, which seldom happens, the bar will lie opposite the middle of the channel. Rivers in general have what may be deemed a bar, although it may not rise high enough to impede the navigation,—for the increased deposition that takes place when the current slackens must necessarily form a bank. Bars of small rivers may be deepened by means of stockades to confine the river current, and prolong it beyond the natural points of the river's mouth; they operate to remove the place of deposition farther out, and into deeper water. Bars, however, act as breakwaters in most instances, and consequently secure smooth water within them. The deposit in all curvilinear or serpentine rivers will always be found at the point opposite to the curve into which the ebb strikes and rebounds, deepening the hollow and depositing on the tongue. Therefore if it be deemed advisable to change the position of a bar, it may in some cases be aided by works projected on the last curve seaward. By such means a parallel canal may be formed which will admit vessels under the cover of the bar.

Bar-harbor. One which from a bar at its entrance cannot admit ships of great draft, or can only do so at high water. *Bar-shallow*, a term sometimes applied to a portion of a bar which has less water on it than other parts of the bar.

Baracoota. A tropical fish (*Sphyræna baracuda*), considered in the West Indies to be dangerously poisonous at times, nevertheless eaten, and deemed the sea-salmon.

Barangay. An East Indian vessel propelled by oars.

Barbadoes Tar. A mineral pitch or petroleum, which flows from the earth or rocks in many places.

Barbalot. The barbel. Also, a puffin.

Barb-bolt. A *rag-bolt.* A bolt with a jagged end to make it hold when it cannot be clinched.

Barbel. A fresh-water fish found in many European rivers; its upper jaw is furnished with four beard-like appendages.

Barber. A singular vapor rising in streams from the surface of the water. The condensed breath on the beard and moustache. A rating on the ship's books for the man who shaves the people.

Barbette (*Fr.*). A mound on which guns are mounted to fire over the top of the parapet. Guns are *in barbette* when they are mounted so as to fire over a parapet, and not through an embrasure. *Barbette gun*, or *barbette battery*, a gun or battery mounted *in barbette*. *Barbette carriage*, a carriage which permits of its gun being mounted in barbette.

Barca (*Sp.*). A small two-masted vessel.

Barca-longa (*Sp.*). A large Spanish coasting vessel with pole-masts and lug-sails. The name is also applied to Spanish gunboats.

Barcarolle. A popular song sung by Venetian gondoliers.

Barcelona. A seaport town of Spain. Lat. (mole light) 41° 22′ 36″ N.; lon. 2° 11′ E. The port is commodious, two moles having been built for its improvement. Pop. 225,000.

Barces. Short guns with large bores, formerly used in ships.

Barchetta. A small bark for transporting provisions.

Barcon. A Mediterranean lighter.

Bareka. A small barrel, spelled also barika.

Bare poles. A vessel at sea is said to be under *bare poles* when no sail is set; in which case she may be either lying-to, or scudding before the gale.

Barge. A vessel or boat of state elegantly furnished. A double-decked passenger or freight boat having no power of its own, but towed by a steamboat. A long double-banked boat of spacious construction for the use of flag-officers. A spacious light-draft river-boat for the transportation of heavy merchandise.

Bargees. The crews of canal-boats and river-barges.

Barge-mate. The officer who steers a boat of state on occasions of ceremony.

Barge-men, or Barges. Picked men who pull the barges.

Barget. An old term for a small barge.

Bari. A city and seaport of Italy, on a peninsula in the Adriatic. Lat. 41° 7′ 52″ N.; lon. 16° 53′ 4″ E. The quay and roadstead are good, and the harbor has been much improved of late. Pop. 52,000.

Barilla. A sea-shore or maritime plant from which soda is made. In commerce this name is applied to the impure carbonate of soda made by burning certain maritime plants. See Algæ.

Bark, or Barque. Any small vessel. A three-masted vessel square-rigged on the fore and main, with fore-and-aft sails on the mizzen-mast. *Bark-rigged*, rigged as a bark, with no square-sails on the mizzen-mast.

Barkantine, or Barquantine. A three-masted vessel square-rigged on the fore-mast, and fore-and-aft rigged on the main- and mizzen-masts.

Barkers. An old term for lower deck guns and pistols.

Barkey. A sailor's term of endearment for the ship to which he belongs.

Barking-irons. Large dueling pistols.

Barling. An old term for the lamprey.

Barling-spars. Spars fit for any small mast or yard.

Barnacle (*Conch.*). A species of the *Balanidæ*, a family of sessile crustaceans. The shells are common along sea-shores, where they adhere to rocks, timber, and vessels. (*Ornith.*) A species of goose (*Anas lucopsis*) frequenting the northern seas in summer and migrating southwards in winter. Formerly the strange notion prevailed that they grew out of the barnacles attached to ships; hence the name.

Barnstable (Mass.). A port of entry on a bay of the same name, which is a part of Cape Cod Bay. Pop. about 430, mostly engaged in the coast-trade and fisheries.

Barometer (Gr. *baros*, weight, and *metron*, measure). An instrument for measuring the weight or pressure of the atmosphere. The discovery of the instrument resulted from an application, made to Galileo by workmen engaged in preparing a suction pump for a deep well, to know why, notwithstanding great care in forming and fitting the valves and piston, the water would not rise higher than about 32 English feet. In that age the doctrine of a *plenum* was an axiom in philosophy; and the ascent of water in the barrel of the pump was universally ascribed to nature's horror of a *vacuum;* Galileo therefore contented himself with replying that the power of nature to overcome a vacuum was limited, and did not exceed the pressure of a column of water 32 feet in height. Before his death, however, which happened soon after, in 1642, he earnestly recommended to his pupil Torricelli to undertake the investigation of the subject. Torricelli, suspecting the true cause of the suspension of the water, namely, the weight of the atmosphere, conceived the idea of trying the experiment with mercury. He perceived that if the weight of the atmosphere forms a counterpoise to a column of water of 32 feet, it must also counterpoise a column of mercury of about 28 inches in height, the weight of mercury being about 14 times greater than that of water. Having procured a glass tube of about 3 feet in length and a quarter of an inch in diameter, hermetically sealed at one end, he filled it with mercury; and covering the open end with the finger, he immersed it in an open vessel containing mercury. On bringing the tube to the vertical position, and removing the finger, the mercury instantly sank, leaving a vacuum at the top of the tube, and after making several oscillations, stood in the tube at the height of about 28 inches above the surface of that in the vessel. On covering the mercury in the vessel with a portion of water, and raising the tube till the lower end came into contact with the water, the mercury all ran out, and the water rushed up to the top of the tube. This experiment, called after its author, the *Torricellian experiment*, demonstrated that the mercury was sustained in the tube, and the water in the barrel of the pump, by exactly the same counterpoise, whatever the nature of it might be. Torricelli died shortly after without completing his discovery, but the fame of his experiment attracted to the subject the attention of philosophers in other countries; among others the celebrated Pascal. After various experiments, all of which tended to establish the pressure of the atmosphere, it occurred to Pascal that if the mercurial column was really supported by atmospheric pressure it must be affected by the weight of the superincumbent mass of air, and consequently be diminished at considerable elevations. Assisted by his brother-in-law, Perier, he conclusively established by experiments the correctness of the theory, and thereupon proposed the barometer as an instrument for measuring the height of mountains, or the relative altitudes of places above the surface of the earth. While Pascal, therefore, is justly credited with the practical demonstration of the value of the barometer in the determination of heights, it is claimed that Claudio Beriguardi, at Pisa, had made the same application of the instrument five years before; and it appears that Alhazen, the Saracen, A.D. 1100, was aware that the atmosphere decreases in density with increase of height.

The barometer in its ordinary form consists of a tube 34 inches in length, closed at the top, exhausted of air, and with its lower end immersed in a cup of mercury, which the pressure of the atmosphere causes to ascend in the tube. The height of the mercurial column varies with changes in the weight of the atmosphere, and a graduated scale alongside the tube, embracing the range of oscillation, enables the variations to be noted.

In all barometric observations there are, in general, two essential corrections to be made: one for capillarity, or depression of the mercury in the tube, and the other for temperature. The following are the corrections for tubes of different diameters according to the theory of Mr. Ivory:

Diam. of tube. *Inches.*	Depression. *Inches.*	Diam. of tube. *Inches.*	Depression. *Inches.*
.10	.1403	.40	.0153
.15	.0863	.45	.0112
.20	.0581	.50	.0083
.25	.0407	.60	.0044
.30	.0292	.70	.0023
.35	.0211	.80	.0012

In siphon barometers (so called from their shape), having both branches of the same diameter, the depression is equal at both ends; consequently the effect is destroyed, and no correction is required. The correction for the temperature, which is the most important, depends on the expansion of the mercury and the expansion of the scale on which the divisions are marked; this latter expansion being very small, is disregarded. In order to ascertain the necessary correction for expansion of the mercury, a thermometer must be attached to the barometer and observed at the same time. The rule usually followed is to "subtract the ten-thousandth part of the observed altitude for every degree of Fahrenheit above 32°." Calculated correction tables are published.

The Aneroid Barometer (Gr. *a*, without, and *neros*, a fluid). In this instrument the varying pressure of the atmosphere is indicated, not by the varying height of a column of fluid, but by the compression and expansion of a small metal vessel from which nearly all the air has

been exhausted. Its external appearance is that of a circular brass box having a dial face, the graduations of which are pointed out by a finger, which is moved by machinery attached to the elastic nearly exhausted vessel fixed within. At the back of the instrument is a screw for the purpose of adjusting its indications by reference to the mercurial barometer. The aneroid requires to be thus originally set, and should be thus adjusted from time to time. It possesses the advantages of being very susceptible and portable, and is a most convenient "weather glass" for ship's use. It is also a convenient instrument for roughly estimating the heights of mountains.

For additional information respecting the barometer and its uses, see "Weather Guides," by Rear-Admiral Jenkins.

Barometer-gauge. An appendage to a boiler or condenser to indicate the state of the vacuum.

Barquantine. See BARKANTINE.

Barque. See BARK.

Barra-boats. Vessels of the western isles of Scotland, carrying ten or twelve men. They are extremely sharp fore and aft, having no floor, but with sides rising straight from the keel, so that a transverse section resembles the letter V. They are swift and safe, for in proportion as they heel to a breeze their bearings are increased.

Barrack-smack. A corruption of *Berwick-smack;* a word applied to small Scotch traders.

Barracoon. A slave warehouse, or an inclosure where slaves are kept.

Barrator. The master of a ship who commits any fraud in the management of the ship, or in relation to his duties as master, by which the owners or insurers are injured.

Barratry. A fraudulent breach of duty or willful act of known illegality on the part of a master of a ship, in his character as master, or of the mariners, to the injury of the owner of the ship or cargo, and without his consent, and it includes every breach of trust committed with dishonest views; as, by running away with a ship, by scuttling or deserting her, or by embezzling her cargo.

Barred Killifish. A fish from two to four inches in length, which frequents salt-water creeks, floats, and the vicinity of wharves.

Barrel. The cylinder between the whelps and the pawl-rim constituting the main piece of a capstan. The part of the wheel on which the tiller-ropes are wound. The tube of a fire-arm. The piston-chamber of a pump. A cylindrical wooden vessel or cask, greater in length than in breadth, bulging in the middle, and composed of staves and headings held together by hoops of wood or iron. A measure of capacity, as 31½ gallons of wine, 36 gallons of ale, or 196 pounds of flour.

BARREL-BUILDER. An old rating on the ship's books, now called *cooper.*

BARREL-BULK. A measure used in estimating capacity for freights. It is equal to five cubic feet, or one-eighth of a ton.

Barrel-screw. A powerful machine, consisting of two large poppets, or male screws, moved by levers in their heads upon a bank of plank, with a female screw at each end. It is of great use in starting a launch.

Barrier of Ice. Ice stretching from the land-ice to the sea- or main ice, or across a channel, so as to render it impassable.

Barrier Reefs. Coral reefs that either extend in straight lines in front of the shores of a continent or large island, or encircle smaller isles, in both cases being separated from the land by a channel of water. Barrier reefs exist in New South Wales, the Bermudas, Laccadives, Maldives, etc.

Barron, James, Commodore U.S.N. Born in Virginia in 1769. Went to sea early in life, and served with his father in the early marine of Virginia, commanding the "Patriot." Entered the navy as lieutenant, March 9, 1798, and cruised under Barry, in the "United States," in the West Indies, and afterwards to France. Promoted to captain, May 22, 1799, commanded the "President" (44) in Dale's squadron to Tripoli, and returned in Morris's squadron in the "New York" (36) in 1802. Transferred to the "Chesapeake" (38), and returned home in her. Again went to the Mediterranean, in the "Essex" (32), under the flag of his brother, S. Barron, and was transferred to the "President" (44) in 1805. Was sixth captain on the new navy list. Returning home in 1806, he was given the "Chesapeake" (44), and hoisted a broad-pennant on her in June, 1807. He put to sea June 22, and was followed out of Chesapeake Bay by the "Leopard" (50), an English frigate, and, while unprepared to fight, was fired into from that ship, after some parley concerning search, and compelled to surrender, having been wounded. He was tried on several charges, found guilty of two, and suspended from rank and pay for five years, until 1813. During the period of his suspension he was absent from the United States, and on his return became involved in a quarrel with Commodore Decatur, and killed that officer in a duel, March 22, 1820, himself being seriously wounded. Resided in Norfolk until 1825. Commanded Philadelphia navy-yard, 1825–27; Norfolk navy-yard, 1827–32; Philadelphia navy-yard, 1833–37; waiting orders, 1838–42. He became the senior officer of the navy in 1839. On leave and waiting orders until his death, which occurred at Norfolk in 1851, April 21, he being 82 years old, and having been in the navy 53 years.—*F. S. Bassett, Lieutenant U.S.N.*

Barry, John, Commodore U.S.N. Born in Wexford County, Ireland, in 1745. He went to sea in the merchant service while yet young. Arriving in America at the age of 15, he adopted it as his home. He received one of the first commissions in our navy. Commanded the "Lexington," brig (16), the first cruiser to sail, and captured the British tender "Edward." Was transferred to the frigate "Effingham" the same year, and commissioned captain, No. 7 on the list. Successfully removed the ships up the river when Philadelphia was taken, and captured a schooner by a bold dash with boats. Volunteered with the army, and was aid to General Cadwalader at Trenton. Appointed to command the "Raleigh" (32), and being chased by a British squadron, he made a brave defense, but ran his ship ashore and lost her.

Commanded several letters of marque in the West Indies. Sailed in February, 1781, in command of the "Alliance" (32), with our minister, Laurens, to France, and on his return in the same year, May 29, captured the English sloop "Atalanta" and brig "Trepassa," and was severely wounded.

Sailed again in 1781, conveying Lafayette and De Noailles to France. Left L'Orient February, 1782, and cruised in the Atlantic. Returning from Havana in March, he was chased by three English ships, but, engaging the first, so injured her that he was able to escape.

Sailed at intervals during the war in letters of marque. Made senior officer of the navy in 1794. In command of the "United States" (44) at Philadelphia, and was influential in having set on foot the construction of those heavy frigates that won so many victories. During the war with France he cruised in European waters in the "United States," protecting our commerce. He died at Philadelphia, September 13, 1803, at the age of 58. He was the third commander-in-chief of the navy.—*F. S. Bassett, Lieutenant U.S.N.*

Barse. The common river-perch.

Bar-shot. Two half balls joined together by a bar of iron, for cutting and destroying spars and rigging. When whole balls are thus fitted they are more properly double-headed shot.

Bart, Jean. Born at Dunquerque, October, 1650. Died in the same place, April, 1702. The life of Jean Bart is, or was, a text-book in the French naval schools, and his memory has always been preserved among the French seafaring population as a type of a French sailor. He is to the French navy what Bayard and Latour d'Auvergne are to the army. In the English navy every old prejudice, as well as the custom of hard fighting, is said to come down from Benbow, and so in the French navy all such traditions are traced to Jean Bart. He was a member of a seafaring family of Dunquerque, on the very N.E. confines of France. He was rather more Flemish than French, in fact.

His father commanded a *corsaire* (somewhat equivalent to a "letter of marque") out of the port of Dunquerque. Jean Bart went to sea at twelve years of age, and long before his majority became "second" of a brigantine, with the euphonious name of the *Cochon Gras*, or "Fat Hog," which cruised in the dangerous navigation of the English Channel as a lookout against the advance of the British fleet.

In 1666, Jean Bart entered the Dutch Marine, serving under the celebrated Admiral de Ruyter in the war with the English. He returned home in 1672, having attained the rank of lieutenant, leaving the Dutch service on account of war breaking out between Holland and France. Still a very young man, he commenced his career as *corsaire*, and for six years his wholesale captures of Dutch vessels caused his name to be known in all northern ports.

In 1679, upon the recommendation of the celebrated Vauban, Jean Bart was commissioned as *lieutenant de vaisseau* in the French Royal Marine.

In 1681 he was sent by Colbert, in command of two frigates, against the Salee pirates. He made a brilliant cruise, bringing back with him many important Moorish prisoners. Two years after, during the war between France and Spain, he made important and successful cruises in the Mediterranean, and was advanced to the rank of *capitaine de frégate*. At this time he organized squadrons of fast frigates and *corsaires* combined, and so drilled them that they were not only able to greatly interfere with the enemy's commerce, but were able to unite and fight in line upon occasion.

By this time his reputation as a bold and skillful commander was so well established that his services were always sought for when anything especially difficult or daring was to be attempted by sea.

In 1689 he convoyed a fleet of powder and provision vessels from Calais to Brest, fighting his way down the channel through a fleet of English and Dutch cruisers. During one of these fights he saw his son, a child of ten years old, showing some trepidation, and at once had him lashed to the mainmast until the action was over. This boy became a vice-admiral in the French navy.

Soon after this Jean Bart was, with Captain the Chevalier Forbin, wounded and taken prisoner in a bloody frigate action in the channel. They were taken to Plymouth, but, owing to the stubborn resistance of the men-of-war, their convoy escaped. He was not many days a prisoner, but succeeded in escaping during foggy weather, and, with Forbin and two or three sailors, seized the yawl of a merchant vessel, and pulled for the French coast. After forty-eight hours of exposure and excessive labor, they landed on the coast of Brittany, near St. Malo. Both he and Forbin were made *capitaines de vaisseau* for this exploit.

Jean Bart was soon at sea again, this time in command of a squadron of frigates, with which he fought several actions and made captures.

In 1690 he commanded the frigate "Alcyon," in Tourville's fleet, with great approval from his admiral; and, upon his return from this cruise, he was allowed to carry out his idea of forming a special squadron to destroy the Dutch commerce in the North Sea and in the Baltic.

By the time he had, at Dunquerque, got ready seven frigates and a fire-ship, he found himself blockaded by thirty-five English and Dutch vessels. He managed, however, to elude them all, and to make his cruise, during which he burnt nearly a hundred English vessels, landed near Newcastle, burnt a number of houses, and returned safely to his port, with his squadron intact and laden with spoil. Never willing to be idle, he was soon off again into the North Sea, this time with only three ships, and again returned with prizes.

Jean Bart's fame was now such that he was sent for by Louis XIV., when the brilliant courtiers of that august monarch were much amused with his brusque manners and ways. He had already been popularly called "the Sea Bear," and all sorts of stories are told of how he bore himself in the presence of the "Sun of France,"—how he smoked his pipe in his presence, clapped the princes of the blood on the back, and generally behaved as a genuine *loup-de-mer*. There appears to be little truth in these relations. Jean Bart was no doubt of simple, plain manners, but long before this period he had associated with some of the best men in France, and he had commanded fleets very successfully. It is not likely, therefore, that he would have been found wanting in common courtesy. The fact appears to be that the stories told of his behavior at court were only a corollary to those popularly related of him, so great was the enthusiasm created by his exploits.

It has been said by Eugène Sue, in his "Histoire de Marine," that Jean Bart could not write, and only signed his name mechanically. This is not probable in the case of one who was a good navigator. The "Archives de la Marine" show exceedingly well-formed signatures of his, although the letters themselves are written by a clerk, as is the case in all services and at all times. The naval registers of Dunquerque show the same thing. M. Vanderest, in his "Histoire de Jean Bart," disposes of these stories in an enthusiastic but complete fashion.

Portraits of Jean Bart show him to have been a square-built man, of fair height, with a good, open, Flemish countenance, blue eyes, and light hair. He spoke several languages, including English, but, it is said, spoke French with a Flemish accent.

In 1693, Louis XIV., wishing to repair the disgrace of La Hogue, gave Tourville command of a new fleet, in which Jean Bart commanded the "Glorieux," and in her fought at the battle of Lagos.

After this he had command of a squadron of six frigates to escort an immense convoy of grain, and succeeded in getting his charge safely into Dunquerque, after a severe battle with the Anglo-Dutch fleet. By this action he saved that part of France from impending famine; and the event was considered so important that a medal was struck to commemorate it. In the same year Jean Bart took three English frigates and their convoy of transports, loaded with provisions and stores.

In 1694, Louis XIV. gave Jean Bart *lettres de noblesse*, with the cross of Saint Louis, and the right to wear the *fleur-de-lis* in his arms.

In the same year the ennobled sailor narrowly missed capturing, in the North Sea, William of Orange, who was returning from Holland to England. A curious speculation could be elaborated upon the result of such a capture. Certainly William would have fared badly as prisoner of Louis XIV., and most likely James II. would have had the English throne.

In 1696, Jean Bart went cruising in the North Sea again, and though, as usual, blockaded in Dunquerque by a strong Anglo-Dutch fleet, he succeeded in eluding them and getting to sea. Just north of the Texel he encountered the Dutch Baltic fleet, and captured their escort of frigates and some forty merchant vessels. When about to take possession of them a very superior force of the enemy hove in sight, and Jean Bart was obliged to burn his prizes, which he did thoroughly, and then made sail in retreat in line of battle, the enemy not caring to pursue. His thorough ability and boldness on this occasion elicited the admiration of the very men opposed to him. Forbin, in his "Mémoires," pretends that Jean Bart was only fitted for frigate actions and *coups de main*, but we have seen that he handled squadrons well, and his dispatches concerning such affairs were always clear and well considered. On his return from this cruise Louis XIV. sent for him, and said, "Jean Bart, I have made you *chef d'escadron*" (commodore,—a higher rank than in our day). "Sire," Jean Bart replied, "you have done well." In the previous year the "Grand Monarque" had hurt Jean Bart's feelings by telling him he had not done as well as usual.

In 1697, Jean Bart took the Prince de Conti to Dantzic, where he went in the hope of obtaining the throne of Poland. On their voyage they were met by an enemy's squadron of no less than nine line-of-battle ships, but they succeeded in escaping from them. The prince said, "We were near being taken!" "Oh, no," said Jean Bart: "I had my son in the magazine, to blow us up before that should happen." The prince was, naturally, shocked at this, and said, "Your remedy is worse than the evil! I forbid anything of the kind while I am on board." Conti got safe to Dantzic, but, as we all know, effected nothing.

In 1697 occurred the peace of Ryswick, and then Jean Bart, for the first time in his life, had a period of repose, which he spent most simply, with his family, at Dunquerque.

As soon as the war of the Spanish Succession broke out he was ordered to command a fleet again. Unfortunately, in his personal exertions in pressing on the preparations he caught cold, had a pleurisy, and died, in April, 1702, just at the time that France had most need of him, for she was soon to be brought to suffer great disasters, both by sea and land.

His successor in the fleet never tried to pass the blockade, as Jean Bart had done so often, and by so doing kept ten times his number employed against him.

Jean Bart was only fifty-two years old when he died, and the loss of no man of his time was more deplored.

In spite of all his prizes he had saved very little money, but the king gave his widow a pension of 2000 crowns.

In 1845 a statue to Jean Bart, by the celebrated David, was erected at Dunquerque. As has been stated, his son became a vice-admiral, and died at the age of 78. His grandson became a *chef d'escadron*, and died in 1784, being the last of his direct descendants.

The last of the descendants of his brother, and the last who bore the name of the great French sailor, died a *lieutenant de vaisseau* in 1843.—*E. Shippen.*

Barton, Wm. P. C., Surgeon U.S. Navy. Born in Philadelphia, Pa., November 17, 1786. He was descended from Rev. Thomas Barton, an Episcopal clergyman who came to America under the patronage of the Penn family, and married in Philadelphia the sister of David Rittenhouse, the celebrated mathematician and astronomer, and the first president of the Philosophical Society. Dr. Barton received his classical education at Princeton College, where he graduated with distinction at an early age. He commenced the study of medicine under the direction of his uncle, Dr. Benjamin Smith Barton, and graduated at the University of Pennsylvania in 1808. After graduating Dr. Barton commenced the practice of medicine in Philadelphia. He was surgeon at the Pennsylvania Hospital, and upon recommendation of the celebrated Dr. Benjamin Rush and Dr. Physick he was appointed surgeon in the navy. He was for many years on active duty, and distinguished himself in the treatment of cases, and by his great skill in the performance of difficult and delicate operations. During his reliefs from sea service he was not content to pass his time unemployed, but devoted himself with great professional ardor to the publication

of various works, which acquired at the time considerable reputation. Among others, his work on "Marine Hospitals" (published in 1814); his "Vegetable Materia Medica," and "Flora of North America," with drawings from nature, made by himself and colored by his wife (published in 1817 and 1818); his translation of the work of the celebrated Gregory on the influences of climate, and other treatises, were extensively circulated, and gained for their author considerable celebrity. He was chosen professor of botany in the University of Pennsylvania, became a Fellow of the College of Physicians of Philadelphia, a member of the American Philosophical Society, president of the Linnæan Society, and honorary member and surgeon of the First City Troop. Upon the creation of the Bureau of Medicine and Surgery in the navy, Dr. Barton was tendered and accepted the appointment of chief of that bureau. In this position he introduced many reforms, corrected and abolished many abuses, and secured the warm commendation and approval of the government. He resigned his position as head of the bureau, but retained his commission in the navy, and had been at the time of his death for several years the senior surgeon of the navy. He died at Philadelphia, February 29, 1856.

Baruth. An East Indian measure, with a corresponding weight of 3½ pounds avoirdupois.

Base. The hemispherical portion of the breech of a gun. The lowest part of the perimeter of a geometrical figure. When applied to a delta it is that edge of it which is washed by the sea, or recipient of the deltic branches. The lowest part of a mountain or chain of mountains. The level line on which any work stands, as the foot of a pillar. An old boat-gun; a wall-piece on the musketoon principle, carrying a 5-ounce ball.

BASE-LINE. In surveying, the base on which the triangulation is founded. In gunnery, a line traced around the breech of a gun, which marks the division between the breech and cylinder.

BASE OF OPERATIONS. That secure line of frontier or fortresses, or strong country occupied by troops, or of sea occupied by fleets, from which forward movements are made, supplies furnished, and upon which a retreat may be made, if necessary.

BASE-RING. A molding around the breech of a gun, between the base and first reënforce.

Bashaw. A Turkish title of honor and command; more properly *pacha*.

Basil. The angle to which the edge of shipwrights' cutting tools is ground away.

Basilicus. A name of Regulus, or the Lion's Heart, *a Leonis;* a star of the first magnitude.

Basilisk. An old name for a long 48-pounder, the gun next in size to the carthoun: called basilisk from the snakes or dragons sculptured in the place of dolphins. Also, in still earlier times, a gun throwing an iron ball of 200 pounds weight.

Basillard. An old term for a poniard.

Basin. A wet-dock provided with flood-gates for restraining the water, in which shipping may be kept afloat at all times of tide. Also, all those sheltered spaces of water which are nearly surrounded with slopes from which waters are received; these receptacles have a circular shape and narrow entrance. Geographically basins may be described as upper, lower, lacustrine, fluvial, mediterranean, etc.

Basket-fish. A name for several species of *Euryale;* a kind of star-fish, the arms of which divide and subdivide many times, and curl up and intertwine at the ends, giving the whole animal something of the appearance of a round basket.

Basket-hilt. The guard continued up the hilt of a cutlass, so as to protect the whole hand from injury.

Basking Shark. So called from being often seen lying still in the sunshine. A large cartilaginous fish, the *Squalus maximus* of Linnæus, inhabiting the Northern Ocean. It attains a length of 30 feet, but is neither fierce nor voracious. See SAIL-FISH.

Bass, or Bast. A soft sedge or rush (*Juncus lævis*), of which coarse kinds of rope and matting are made. A Gaelic term for the blade of an oar.

Basse. A species of perch (*Perca labrax*), found on the coast and in estuaries, commonly about 18 inches long.

Bassos. An old term for *shoals*. Rocks a-wash, or below water.

Bast. The inner bark of the lime-tree or linden, hence the cordage or mats made from this bark. See BASS.

Basta. A word from the Italian, in former use for *enough*.

Bastard. A term applied to all pieces of ordnance of unusual or irregular proportions. A square-sail in use in some Mediterranean craft; it was occasionally used as an awning.

Bastard-mackerel, or Horse-mackerel. The *Caranx trachurus*, a dry, coarse, and unwholesome fish of the family *Scomberidæ*.

Bastard-pitch. When a mixture of equal parts of colophony, black pitch, and tar is boiled down, it forms a liquid substance called by the French *bray gras*. When a thicker consistence is required more colophony is added, and it is then called *bastard-pitch*.

Baste. To beat; to cudgel. To sew with long stitches.

Bastile. A temporary wooden tower used formerly in military and naval warfare. The name is specifically applied to an old fortification in Paris built in the 14th century, long used as a state prison, but demolished by the populace in 1789.

Bat, or Sea-bat. An Anglo-Saxon word for boat or vessel. A broad-bodied thoracic fish (*Chætodon vespertilio*).

Batardate. A square-stemmed row-galley.

Batardeau. Planks to prevent the entrance of water when a ship is hove down for repairs.

Batardelle. A galley less strong than the capitana.

Batavia. A city and seaport of Java, at the mouth of the Jukatra River, on the N. coast of the island, with a free port, extensive and safe. Lat. 6° 8′ S.; lon. 106° 50′ E. The bay or harbor forms a roadstead of great beauty, and may be entered by vessels of the largest class. Pop. 100,000.

Bateau. A flat-bottomed, sharp-ended, clumsy boat used on the lakes and rivers of Canada. A peculiar army pontoon.

Bated. A plump, full-roed fish is said to be *bated*.

Batella. A small plying-boat.

Bath (Maine). A city and port of entry on the right bank of the Kennebec River, 12 miles from the ocean, 36 miles N.E. of Portland. Wooden ship-building is carried on at Bath to a very large extent. Pop. 11,000.

Bath-brick. A preparation of calcareous earth in the form of a brick, used for cleaning bright-work.

Bathometer. A sounding apparatus, which see.

Bathymetry. The art or science of measuring the depth of the sea.

Batillage. An old term for boat-hire.

Batman. A weight used in the East, varying according to locality.

Bat-swain. An Anglo-Saxon expression for *boatswain.*

Battard. An early cannon of small size.

Batteloe. A lateen-rigged vessel of India.

Batten. Scantlings from one inch to three inches broad. Long slips of timber used for setting fair the sheer lines of a ship, for staying the lower masts, and for setting off distances generally. Strips of wood secured to masts, yards, or rigging to protect them from chafe. Slips of wood used for confining the edges of the tarpaulins over the hatches.

To BATTEN DOWN THE HATCHES, to haul over the tarpaulins and secure them by nailing battens over them.

Battering Charge. A charge of powder heavier than the ordinary charge, to be used against ironclads or masonry at short range for a limited number of fires.

Battering-guns, or Battering-pieces. Guns whose weight and power fit them for demolishing by direct force the works of the enemy.

Battery. A place where guns or mortars are mounted. A body of cannon taken collectively; as, the starboard battery. Two or more pieces of artillery in the field. *Barbette battery*, one without embrasures. *Floating-battery*, a vessel heavily clad with iron, and having little or no steam-power, used for harbor defense; a battery mounted on a raft or hulk. *Masked, or covered battery*, one concealed from the enemy by a bank or breastwork until it opens fire. *Water-battery*, one close to and nearly on a level with the water. *Mortar-batteries* have no embrasures, the mortar being generally fired at an angle of 45°. See ELECTRIC BATTERY, GALVANIC BATTERY.

Battle-lantern. A lantern supplied to each gun for lighting up the decks during an engagement at night.

Battle-royal. A term derived from cock-fighting, but generally applied to a noisy, confused row.

Battle the Watch. To contend with a difficulty; to shift as well as one can; to depend on one's own exertions.

Bat-ward. An old term for a boat-keeper.

Bavin. See BORE.

Baw-burd. An old expression for *larboard.*

Bawdrick. A corruption of *baldrick.*

Bawe. A species of worm used for bait for fish.

Bawgie. One of the names given to the great black and white gull (*Larus marinus*).

Bawkie. A name for the awk, or razor-bill.

Baxios (*Sp.*). Rocks or sand-banks covered with water.

Bay. An inlet of the sea, having a wide entrance, and usually smaller than a gulf, although many large sheets of water are named bays. Of the many names adopted to designate inlets from the seas, those of fiord and viik may be properly included under the head of bays. The greater portion of inlets so named are of salt water, but many fresh-water bays exist, especially in the great American lake-region. An enumeration of the bays would require several pages, and some that are not from their size geographically important are remarkable nevertheless from the rivers that empty into them, as Delaware Bay; the cities that are situated on them, as Boston Bay; from natural causes, as Fundy Bay from its great rise of tides; from historical reasons, as Aboukir Bay; from strategical causes, as Gibraltar Bay; or from some use made of them, rendering them peculiarly notable, as Botany Bay, the home of English convicts.

Keith Johnston, in his "Royal Atlas," enumerates more than a thousand bays, and this number would doubtless increase threefold on a careful count of our charts of the known coasts of the world. Of these, Europe has by far the greater number, there being about 440 on the chart, and North America comes next with 230, while South America and Oceanica have upwards of 100 each, and Asia has upwards of 80, Africa having no more than 60. Of European countries, the British Isles have the most bays, and Norway comes next with her *fiords.* Holland, Belgium, and Corsica have none; Italy, Portugal, Austria, and Turkey one each.

The principal bays of Asia are the Tidanski, Taimurski, Katangski, and Borkaia on the Arctic Ocean, Avatcha, Ulbansk, Vladimir, Victoria, Broughton, Hangchow, Yeddo, Hakodadi, Wanchow, Manila to the eastward, and the great Bay of Bengal on its south shores.

The principal African bays are Sofala, Delagoa, and Algoa to the eastward, False, Table, St. Helena, and Walfisch on the west, Algiers, Tunis, and Arab bays to the northward. Neustadt, Kiel, and Lübeck on the Baltic, Cardigan, Donegal, and Galway in the British Isles, and Biscay, Cancale, and Fetubâl on the west coast, comprise the principal European bays. North America has many large bays, chief of which are Mackenzie, Baffin's, Frobisher's, Hudson, James, Ungava, and Cumberland on the north coast, Melville and Disco in Greenland, Bay of Fundy, Massachusetts, Cape Cod, Delaware, Chesapeake, Long, and Onslow bays on the east coast, Appalachicola, Pensacola, and Galveston on the Gulf, Campeachy, Fonseca, and Tehuantepec in Mexico and Central America, and Magdalena, Seb. Vizcaino, Monterey, San Francisco, and Bristol bays on the west coast. South America has Bahia de Todos os Santos, Rio Janeiro, and White bays on its east coast, and Arauco, Coquimbo, Salado, Moreno, Pisco, Sechura, and Buenaventura on her west coast. Australia is well provided with bays, Prince Charlotte, Hervey, Encounter, Geographe, and Shark bays being the most important.

Three bays are particularly noticeable from their great size, viz.: 1. Bay of Bengal. This is a triangular sheet of water, an arm of the Bengal Sea, washing the northeastern shores of Hindostan and the west coast of Pegu. It ex-

tends over 6 degrees of latitude and 10 of longitude, being about 200,000 square miles in area. It is the recipient of the great Brahmapootra, Ganges, and Shina rivers, but contains no obstacles to navigation except near the land. 2. Bay of Biscay. This is a trapezoidal-shaped bay, an arm of the Atlantic, washing the southwest coast of France, where its shores are low and marshy, and the rocky and mountainous north coast of Spain. It embraces some 8 degrees of latitude and 5 of longitude, being about 125,000 square miles in area. It receives the waters of the Adour, Garonne, and Loire. 3. Hudson's Bay, discovered in 1615 by Hendrik Hudson. It is situated wholly within the North American continent, and is nearly square, having, as an addition, James Bay, itself of some extent. Hudson's Bay occupies some 9 degrees of latitude and 14 of longitude, and contains some 300,000 square miles of area. It communicates with the Atlantic by a strait of the same name, and with the Arctic Ocean by several passages. Some idea of the great size of these bays is obtained by a comparison with countries. The Bay of Bengal is as large as Germany, or its own neighbor, Siam. The Bay of Biscay is as large as Holland, and Hudson's Bay would about cover Spain.—*F. S. Bassett*, *Lieutenant U.S.N.*

Bay. The fore part of the ship between decks. See SICK-BAY.

Bayamos. Violent blasts of wind blowing from the land, on the south coast of Cuba, and especially from the Bight of Bayamo. They are accompanied by wind and lightning, and generally terminate in rain.

Bay-bolt. A bolt with a barbed shank.

Bay-gulf. A branch of the sea of which the entrance is the widest part, as contradistinguished from the strait-gulf.

Bay-ice. Ice newly formed on the surface of the sea, and having the color of the water; it is then in the first stage of consolidation. The term is sometimes applied to ice a foot or two in thickness in bays.

Bayle. An old term for *bucket.*

Bayonet. A short triangular dagger fitted to the muzzle of a musket or rifle, for the purpose of giving the fire-arm effect as a thrusting weapon. It takes its name from Bayonne, France, where it is said to have originated. It was first used by the French in the Netherlands in 1647. Formerly the handle of the bayonet was inserted into the bore of the fire-arm, and had to be unfixed when the piece was fired; to remedy which it is now made with a hollow handle and a shoulder so that it fits over the barrel, and sets off from the line of fire. Modifications affecting the shape of the blade have also been made, of which the sabre-bayonet and the more recent trowel-bayonet are examples. The latter form of bayonet, invented by Bvt. Lt.-Col. Rice, U.S.A., is less sightly than the triangular, either fixed or worn as a side-arm, but is most valuable as an intrenching tool to forces operating on land.

Bayou. The outlet of a small lake; a creek or small river.

Bazaras. A large pleasure-boat of the Ganges impelled by oars and sails.

Beach. A shelving tract of sand or shingle washed by the sea or a lake, and interposed between the water and the land on which vegetation grows. The beach of the ocean is, generally speaking, little more than the space between low- and high-water mark; the beach of a lake that between the water-marks of the highest and lowest ordinary level of the lake. An inland sea without tide, such as the Mediterranean, has generally little beach, except on flat coasts, where the waters are apt to rise and fall considerably, according to the prevailing winds. To land a person with the intention of deserting him, an old buccaneer custom. To run a boat or a vessel on the beach, either to land or for the purpose of repairs where there are no other accommodations. See SURF.

BEACH-COMBERS. Long waves rolling in from the ocean. Loiterers around a bay or harbor.

BEACH-COMBING. Loafing about a port to filch small things.

BEACH-FLEA. A small crustacean (*Talitra*) frequenting sandy shores.

BEACH-GRASS. *Alga marina* thrown up by the surf or tide.

BEACH-MAN. A person on the coast of Africa who acts as interpreter to shipmasters, and assists them in conducting trade.

BEACH-MASTER. An officer appointed to superintend the disembarkation of an attacking force, who holds plenary powers, and generally leads the storming party.

BEACH-MEN. A name applied to boatmen and those who land people through a heavy surf.

BEACH-RANGERS. Men hanging about seaports, who have been turned out of vessels for bad conduct.

BEACH-TRAMPERS. A name applied to the coast-guard of England.

Beacon. A post or stake erected over a shoal or sand-bank, as a warning to seamen to keep at a distance; also a signal-mark placed on the top of hills, eminences, or buildings near the shore for the safe guidance of shipping.

BEACONAGE. A payment levied for the maintenance of beacons.

Be-aft. A term frequently used by sailors for *abaft.*

Beak, or Beak-head. A piece of brass like a beak, fixed at the head of the ancient galleys, with which they pierced their enemy's vessels. Pisæus is said to have first added the rostrum or beak-head. Later it was a small platform at the fore part of the upper deck, but the term is now applied to that part without the ship before the forecastle, or knee of the head, which is fastened to the stem and is supported by the main knee. Latterly the whole of this is enlarged, strengthened, and armed with iron plates, and thus the armed stem revives the ancient strategy in sea-fights.

Beam. A long double stratum of murky clouds generally observed in the Mediterranean previous to a violent storm. A collection of parallel rays emitted from the sun or other luminous body. Any large piece of timber or iron long in proportion to its other dimensions. One of the heavy transverse timbers which support the deck and retain the sides of a ship in shape. *Beam*, or *breadth of beam*, the width of a ship. *On the beam*, in a line with the beams, or at right angles to the keel.

BEAM CENTRE. The fulcrum on which the walking-beam vibrates.

BEAM-ENDS. A ship is said to be *on her beam-*

ends when she has heeled over so much that her beams approach a vertical position. The expression is used figuratively for a person in distress.

BEAM-ENGINE. An engine with an oscillating beam, by which the power is transmitted from the piston to the shaft.

BEAM-FILLINGS. Short pieces of wood to fit between the beams, to complete a cargo of timber.

BEAM-LINE. A line which indicates the intersection of the upper part of the beams with the frames of a ship.

BEAM, WALKING-. The beam of a beam-engine, called also *working-beam.*

Bean-cod. A small fishing-vessel, or pilot-boat, common in Spain and Portugal. It is fitted with a large lateen-sail, and sometimes has an outrigger over the stern. It is extremely sharp forward, and works well to windward.

Bear. A coir-mat filled with sand, or a block of stone, matted, loaded with shot, and fitted with ropes, for hauling to and fro to grind the decks.

Bear. *To bear down* upon a vessel is to approach her from to windward. *To bear up*, to put the helm up and run off to leeward. *To bear sail*, stiff under canvas. *To bring the guns to bear*, to so lay the ship's head that the guns may be pointed at the enemy. *To bear in with* (or *off from*) the land is to stand in toward (or off from) the coast. *To bear off*, to push one object off from another; as, a lighter from the ship's side.

BEAR A BOB, OR A FIST. Jocular for *lend a hand.*

BEAR A HAND Hasten.

Beard. The silky filaments by which some testacea adhere to the rocks. The gills of an oyster. The rays of a comet emitted toward that part of the heavens to which its proper motion seems to direct it.

Bearding. The diminution of the edge or surface of a piece of timber from a given line; as, on the stem, deadwood, etc.

Bearding-line. The trace of the inner surface of the ship's skin on the keel, stem, and stern-post.

Bearer. An instrument used in handling heavy shells.

Bearing. The manner in which a person conducts himself. The portion of an axle or shaft in contact with its supports. The bearing of an object or place is the angle contained between the meridian and the vertical plane through the object. It is the same as the *course* to the place.

BEARING, COMPASS. The bearing of an object as observed by the compass. It is the angle between the needle of the standard compass on board the ship of the observer and the direction of the object: it is, therefore, affected by the deviation and variation of the compass. If the correction for deviation be applied, the *True Magnetic Bearing* is obtained; and if, further, the correction for variation be applied, the *True Bearing* or *Azimuth* is deduced.

BEARING, MAGNETIC. The magnetic bearing, or "*True Magnetic Bearing*," of an object is the angle which its direction makes with the magnetic meridian. This is the bearing which is observed with the azimuth compass after being corrected for local deviation; from it the *True Bearing* is deduced by applying the correction for variation.

BEARING, TRUE. The true bearing of an object, or the "*Bearing*," properly so called, is the angle which the direction of the object makes with the meridian. It is thus qualified to distinguish it from the *Compass* and *Magnetic Bearing*. See AZIMUTH.

BEARING, TAKING A. Taking a bearing of an object is to ascertain its direction by the compass.

BEARINGS, CROSS. "Cross Bearings" are the bearings of two or more objects taken from the same place, and therefore intersecting or "crossing" each other at the station of the observer. When near a coast where the landmarks are well laid down on the chart, cross bearings give the position with ease and accuracy.

BEARING, LINE OF. If a ship is in the vicinity of land, one "*Circle of Equal Altitude*" (Sumner's Method) is often of great use to the navigator who is uncertain of his exact position. He is on some point of this circle, but does not know where. Let him project it on his chart and produce the resulting line till it meets or passes near the land. Such a line is called a "Line of Bearing." If it hit any prominent mark or light, the *bearing* of this is known, and by sailing along the line of bearing till the object is sighted, the exact position of the ship may be picked up. The line of bearing may cross the range of a light-house, and consequently, when the light is first sighted, the exact position of the ship is known. Or the position on the line of bearing may be found by soundings. When the coast trends parallel to the line of bearing, the distance of the ship from the shore is indicated, though her absolute position is uncertain.

Bearing Binnacle. A small binnacle, generally placed in the centre of the forward part of the poop-deck.

Bearings. The widest part of a vessel below the plank-shear. The line of flotation when properly trimmed with stores and ballast on board. *To bring a person to his bearings* is to bring him to his senses; to put him under control.

Beat. To make progress against a head wind by a series of zigzag courses.

Beaten Back. Forced to return on account of a head wind and sea.

Beating Wind. A wind which necessitates tacking to make progress.

Beating the Booby. Swinging the arms from side to side to create a warmth by accelerating the circulation of the blood.

Beaufort (S. C.), a port of entry, on Port Royal or Beaufort Island, on an inlet called Port Royal River, about 14 miles from the ocean, and 55 miles W.S.W. of Charleston. Pop. 2000.

Beaumont, J. C., Commodore U.S.N. Appointed midshipman, March 1, 1838; sloops-of-war "Ontario" and "Erie," 1838–40; frigate "Constellation" during her cruise around the world, 1840–44.

Promoted to passed midshipman, 1844; sloop-of-war "Jamestown," coast of Africa, acting master, 1844–46; ship-of-the-line "Ohio," West India Squadron, 1846; at the fall of Vera Cruz; frigate "Columbia," 1847, acting lieutenant; Naval Observatory, Washington, D. C., 1848; razee "Independence," Mediterranean Squadron, master and acting lieutenant, 1849–52.

Promoted to lieutenant in 1852; Naval Ob-

servatory, 1852–54; steamer "San Jacinto," on the coast of Europe and the West Indies, 1854–55; frigate "Potomac," Home Squadron, 1856; steam-frigate "Wabash," Home Squadron, 1857; receiving-ship at New York, 1857–58; steam-sloop "Hartford," East India Squadron, 1859–60; sloop-of-war "John Adams," executive-officer, 1860–61; lieutenant-commander, commanding steamer "Aroostook," North Atlantic Squadron, 1862; was an active participant in the engagements with the enemy's batteries in the James River and at Fort Darling, in May, 1862.

Promoted to commander, 1862; commanded the steam-gunboat "Sebago," South Atlantic Squadron, 1862–63; commanded monitor "Nantucket," 1863, in various engagements with the rebel fortifications in Charleston harbor, and took a leading part in the capture of Fort Wagner; commanded steamer "Mackinaw," 1864–65, in the North and South Atlantic Squadrons; participated in all of the attacks on Fort Fisher, where his vessel was badly cut up by the enemy's shell; participated in all of the subsequent engagements with the rebel batteries on the Cape Fear River; commanded the iron-clad "Miantonomah," special cruise on the coast of Europe, 1866–67; retired in 1868.

Restored to the active list in 1873, as captain; commanded the steamer "Powhatan," 1873–74, special service.

Promoted to commodore in 1874; chief signal-officer of the navy, 1875–79; commandant navy-yard, Portsmouth, N. H., 1879–80.

Becalm. To render quiet or calm by intercepting the current of air in its passage to the object; thus the jib is becalmed by the foresail when before the wind.

BECALMED. Rendered quiet. State of a vessel at sea when there is no wind.

Becket. A small grommet used for various purposes; as, for reefing with toggles, for hitching the standing part of a fall, etc. A sailor's name for *pocket*.

Bed. Flat thick pieces of wood, lodged under the quarters of casks containing any liquid, and stowed in a ship's hold, in order to keep them bilge-free; being steadied upon the beds by means of wedges called quoins. The impression made by a ship's bottom on the mud when aground. The bite made in the ground by the fluke of an anchor. A kind of false deck, or platform, placed on those decks where the guns were too low for the ports. A platform for supporting a mortar. That part of the channel of a stream over which the water generally flows, as also that part of the basin of a sea or lake on which the water lies. *Bed of a gun-carriage*, or *stool-bed*. The piece of wood between the brackets which, with the intervention of the quoin, supports the breech of the gun. It is itself supported, forward, on the *bed-bolt*, and aft on the rear axle. *Bed of the bowsprit*, a bearing formed out of the stem and apron, to support the bowsprit; it is lined with lead to prevent the water from getting below on account of any shrinkage in the timber.

BED-BOLT. A horizontal bolt passing through both brackets of a gun-carriage, and on which the forward end of the stool-bed rests.

BEDDING A CASK. Placing dunnage round it.

Bedlamers. Young Labrador seals, which set up a dismal cry when they cannot escape their pursuers.

Bed- or Barrel-Screw. A powerful machine for lifting large bodies, and placed against the gripe of a ship to be launched for starting her.

Be-dundered. Stupefied with noise.

Bee-blocks, or Bees. Pieces of hard wood bolted to the sides of the bowsprit, through which are rove the fore-topmast stays.

Beef. A figurative term for strength. *More beef!* more men on.

Beef-eater. A man more distinguished for physical strength than for mental weight. It is Jack's term for an Englishman.

Beetle. A shipwright's heavy mallet for driving the reeming-irons.

Beetle-head. A large beetle used in pile-driving.

Before the Mast. A term used to distinguish the ship's crew from the officers.

Before the Wind. A vessel having the wind aft is *before the wind*. The yards are squared, and as the mainsail becalms the foresail and causes the ship to steer badly, it is generally taken in, though in the very long ships of the present day it is sometimes carried.

Beggar-bolts. A contemptuous term for the missiles which were thrown by the galley-slaves at an approaching enemy.

Behavior. The action and qualities of a ship under different impulses. Seamen speak of the manner in which she *behaves* as if she acted by her own instinct.

Behring, Vitus, a celebrated Danish navigator. Born in Jutland, 1680, entered the Russian navy at an early age, and fought with distinction against the Swedes. In 1725 engaged in command of an expedition to explore the Sea of Kamtchatka, this skillful Danish navigator discovered in 1728 the straits which connect the Pacific and the Atlantic, and they received his name. In a subsequent voyage he was wrecked on Behring's Island, where he died December 8, 1741.

Beikat. See BYKAT.

Beiled. A sea-term in the old law-books, apparently for moored.

Belay. To secure a rope with turns around a pin, cleat, or cavil.

BELAYING-PIN. A small pin of wood or iron to which are made fast the hauling parts of the running-gear.

Belcher, Sir Edward. Born in 1799, entered the navy in 1812 as a volunteer; in 1816 took part in the bombardment of Algiers. Distinguished above every other British admiral for his voyage round the world and his exploration of the American shores of the Pacific, he was nevertheless unfortunate in an attempt that he made in 1852 to trace the whereabouts or the fate of Sir John Franklin. He lost both of his ships in the enterprise, and was, according to custom, tried by court-martial for the disaster. The verdict was honorable acquittal. In 1864 he became rear-admiral of the red.

Belfast (Me.). A city and port of entry on the W. side of Penobscot Bay (which is the estuary between the Penobscot River and the ocean), 42 miles E. by N. from Augusta, and 30 miles from the ocean. Many of the inhabitants are employed in ship-building. Pop. 6200.

Belfry. A frame or shelter under which the ship's bell is suspended.

Bell. The rapid ringing of a ship's bell is the fire-alarm, which see. The tolling of the bell is the summons to divine service. The principal use of the bell on board ship is to mark the time. At four, eight, and twelve o'clock the bell is struck eight times,—half an hour afterwards it is struck once, and an hour afterwards it is struck twice, and so on until the end of the watch, when it is struck eight times, after which the preceding routine is again carried out. Time is reckoned by *bells*, thus *three bells* in the forenoon is half-past nine o'clock, and *four bells* in the afternoon is two o'clock, etc.

Bell, Charles H., Rear-Admiral U.S.N. Born in New York, 1798. Appointed midshipman June 18, 1812; attached to Commodore Decatur's squadron all of 1813 and until the spring of 1814; in the summer of 1814 was transferred to the squadron of Commodore Chauncey, on Lake Ontario, where he remained until the war ended; attached to Commodore Decatur's squadron, in the Mediterranean, in 1815.

Commissioned as lieutenant, March 28, 1820; serving in sloop-of-war "Erie," West India Squadron, 1829; navy-yard, New York, 1833; sloop "Vincennes," Pacific Squadron, 1834–35; commanding schooner "Dolphin," Pacific Squadron, 1836.

Commissioned as commander, September 10, 1840, and ordered to command the schooner "Dolphin," Brazil Squadron; commanding sloop-of-war "Yorktown," coast of Africa, 1846; navy-yard, New York, 1850; special duty, 1851–54.

Commissioned as captain, August 12, 1854; commanding frigate "Constellation," Mediterranean Squadron, 1856–58; commandant Norfolk navy-yard, 1860.

Commissioned as commodore, July 16, 1862; commanding Pacific Squadron, 1862–64; special duty, James River, 1865.

Commissioned as rear-admiral, July 25, 1866; commandant navy-yard, New York, 1866–68; died 1872.

Bell, Henry H., Rear-Admiral U.S.N. Born in North Carolina, 1808; midshipman, August 4, 1823; lieutenant, March 3, 1831; commander, August 12, 1854; captain, 1861; commodore, July 16, 1862; rear-admiral, July 25, 1866. First served in the "Grampus" in clearing the coast of Cuba of pirates. He commanded one of the vessels of the East India Squadron, which, in November, 1856, captured and destroyed the four barrier forts near Canton, China. Assigned to the Gulf Squadron in 1861, and as fleet-captain took an active part in the capture of New Orleans and siege of Vicksburg. He was for a time in 1863 in command of the West Gulf Squadron, and when Admiral Thatcher was ordered to other duty its command again devolved on him. In July, 1865, he was ordered to command the East India Squadron, and was very active in putting down the pirates that infested the Chinese seas. In 1867 he was retired, but had not been relieved when he was drowned at the mouth of the Osaka River, Japan, January 11, 1868.

Bella Stella. A name used by old seamen for the cross-staff.

Bellatrix (Lat. *warlike*). The name for the bright star γ *Orionis.*

Bell-buoy. A buoy on which is placed a bell, which is sounded by the action of the waves.

Belligerent (Lat. *bellum*, war, and *gerens, gerentis*, waging). Waging war. Tending or pertaining to war; as, *belligerent rights.* A nation, power, or state carrying on war. See INTERNATIONAL LAW.

Bellona. The goddess of war.

Bellows. *An old hand at the bellows*, a phrase equivalent to saying that a person is well posted in all his duties. When a gale increases the sailors say there is a *fresh hand at the bellows.*

Bell-rope. A piece of rope spliced around the clapper for convenience in striking the bell.

Belly. The inner or hollow part of compass timber. The swell of a sail. *Bellying canvas*, sails inflated with wind.

BELLY-BAND. A strengthening band of canvas from leech to leech, half-way between the lower reef-band and the foot of the sail.

BELLY-GUY. A rope or tackle applied half-way up a sheer-leg, or long spar, to keep it from buckling.

BELLY-MAT. See PAUNCH-MAT.

BELLY-STAY. See BELLY-GUY.

Belone. A genus of abdominal fishes of the *Esox* or pike family.

Below. The opposite of *on deck.* Below the spar-deck.

Belt. A zone; as, a calm belt. To strike.

Belting. A beating.

Beluga. A fish of the cetaceous order and dolphin family. The northern *beluga* is the white whale and white-fish of the whalers.

Benbow, John, Admiral. Born in Shropshire in 1650. Beginning life as a midshipman in the reign of James II., Benbow became a favorite of his successor, William III. After much hard service in different quarters he was engaged with a superior French force under Admiral Ducasse off St. Martha, in the West Indies, where he lost his right leg. In the midst of the fight he was deserted by a part of his squadron, which sorely galled him, as it reflected on the honor and credit of the navy. He exclaimed that he would rather have lost both legs than witnessed the disgrace of the service. Died November 29, 1702.

Bench-mark. One of a number of marks along a line of survey indicating a series of levels at different elevations.

Bend. To make fast a rope to an anchor, spar, or another rope. (See STUN'-SAIL-HALLIARD-, FISHERMAN'S-, SINGLE-, DOUBLE-, and CARRICK-BEND.) *To bend a sail* is to make it fast to its proper yard, gaff, or stay, and reeve all the gear belonging to it. *To bend to the oars*, to give way strong. *To bend the cable*, the operation of making fast the cable to the ring of the anchor. The term is still used for shackling the chain to the anchor.

Bender. A spree or jollification.

Bend-mold. A mold made to form the futtocks in the square body.

Bends. The thickest and strongest planks on the outward part of a ship's side. They are more properly called wales. They are reckoned from the water, and are distinguished by the titles of *first, second*, or *third bend.* They are the chief strength of a ship's sides, and have the beams, knees, and foot-hooks bolted to them. Bends are also the frames or ribs that form the ship's body from the keel to the top of the side, individualized by each particular station. That at

the broadest part of the ship is denominated the *midship-bend* or *dead-flat*.

Be-neaped. The situation of a vessel when she is aground at the height of spring-tides. See NEAPED.

Bengal-light. See BLUE-LIGHT.

Benicia (Cal.). On the north side of the Strait of Carquinez, about 40 miles N.E. of San Francisco, and 56 miles S.W. of Sacramento. It is at the head of navigation for the largest ships, and contains the depot and machine-shops of the Pacific Mail Company. Pop. 2000.

Benjy. A low-crowned straw hat, with a very broad brim.

Benk. A term for a low bank, or ledge of rock; probably the origin of *bunk*, or sleeping-places in merchant vessels. See BUNK.

Benn. A small kind of salmon.

Bent. The trivial name of the *Arundo arenaria*, or coarse unprofitable grass growing on the sea-shore.

Bentinck-boom. The boom which stretches the foot of the foresail in many small square-rigged merchantmen; particularly used in whalers in the ice, with a reefed foresail to see clearly ahead. The tack and sheet are thus dispensed with, a tackle amidships bringing the leeches taut.

Bentincks. Triangular courses, so named after Captain Bentinck, by whom they were invented.

Bentinck Shrouds. Ropes of the size of the topmast rigging, seized on to the weather futtock-staff and set up to the lee channels, to support the mast when rolling heavily. They are not now in use.

Bent on a Splice. Going to be married.

Bergen, a fortified city and seaport of Norway, is on a peninsula at the end of a deep bay on the Atlantic, 190 miles W.N.W. of Christiania. Lat. 60° 24′ N.; lon. 5° 18′ E. Bergen is the station of a naval squadron. Its harbor is deep and sheltered, and defended by several forts. Ship-building is carried on; the fishery is, however, the principal employment. Pop. 36,000.

Bermuda Sails. See 'MUGIAN.

Bermuda Squall. A sudden and strong wintry tempest experienced in the Atlantic Ocean, near the Bermudas; it is preceded by heavy clouds, thunder, and lightning. It belongs to the Gulf Stream, and is felt, throughout its course, up to the banks of Newfoundland.

Bermudez, Juan. A Spaniard who, in the era of Spanish discoveries (1522), came upon the cluster of islands in the West Indies, to which he gave his own name. The Bermudas, though often "vexed" with storms, are among the most beautiful of the isles of the west, and are particularly valuable as harbors for vessels bound either to the north or south of the American continent. They are now the property of Great Britain. "Somerset Island" derives its name from a navigator who was driven upon it in a gale.

Bermudians. Three-masted schooners, built at Bermuda for the English during the war of 1814; they went through the waves without rising to them, and consequently were too ticklish for northern stations.

Bernak. The barnacle goose (*Anser bernicla*).

Bersis. A species of cannon formerly much used at sea.

Berth. The place in which a ship lies when she is at anchor. Situation, position, or employment of an individual. The space allotted to a sailor to sleep in. *To give a point* or *rock a wide berth*, to keep at a considerable distance from it. *To berth a ship's company*, to allot to the crew the place in which they are to swing their hammocks. The watches are distributed in equal numbers on each side of the ship. The boys are berthed apart from the men. Marines, quartermasters, and others who sleep in till six bells are berthed well aft, so they will not be disturbed when all hands are called. Boatswain's mates swing near the hatches. Over each man's hammock-hook is hung a tin plate with his hammock-number.

BERTH-DECK. The deck next below the lower gun-deck.

Berthing. The rising or working up of the planks of the ship's side. Berthing also denotes the planking outside above the sheer-strake.

Bervie. A haddock split and half dried.

Berwick Smack (*Eng.*). The old and well-found packet of former days.

Bessemer Process. See STEEL.

Best Bower. See ANCHOR.

Betelguese, or Betelgeux. The name for the bright star *α Orionis*.

Betty Martin. *My eye and Betty Martin* is an expression implying disbelief. It is a corruption of the Romish *mihi, beate Martine!*

Between-decks. The space comprised between any two whole decks.

Betwixt Wind and Water. That portion of a vessel's side which is sometimes below and sometimes above the surface of the water. This is the most dangerous place to receive a shot, hence the figurative phrase "a shot betwixt wind and water," to express a palpable hit in an argument.

Bevel. Any angle except a right angle; a sloped surface. An instrument composed of a stock and movable tongue, used by shipwrights in getting out frame timber, plank, etc., to the desired angle.

BEVELING. The angle formed between one surface and another. When it is an obtuse angle it is called a *standing* beveling; when the angle is acute it is called an *under* beveling.

BEVELING-BOARD. A piece of white pine board on which the beveling of the frame timbers is described.

BEVELING-EDGE. The edge of a ship's frame which is in contact with the skin.

Bewpar. The old name for bunting.

Bezant. An early gold coin, so called from having been first coined at Byzantium.

Bhur. A lighter used for discharging cargo at Calcutta.

Bibbs. Pieces of timber bolted to the hounds of a mast, to support the tressle-trees.

Bible. A small holystone. It is also called a prayer-book. It is so named because sailors kneel in using them to clean the decks.

Bible-press. A hand rolling-board for cartridges, rocket, and port-fire cases.

Biddle, James, Commodore U.S.N., was born in Philadelphia in 1783, and entered the navy as midshipman in 1800. On his second cruise he was captured, with Capt. Bainbridge and the other officers and crew of the frigate "Philadelphia," by the Tripolitans, when that ship had struck

upon an unknown rock off the harbor. After an imprisonment of twenty months the captives were released. From that time until the war of 1812 Biddle was actively employed, and upon the breaking out of hostilities sailed in the sloop-of-war "Wasp," Capt. Jacob Jones, as first lieutenant. In October, 1812, the "Wasp" captured the British sloop-of-war "Frolic," of about equal force, this being the second of those famous naval combats of which Alison says, "No words can convey an adequate idea of the impression which the successive capture of these three frigates and two sloops made, not only in Great Britain and America, but over the whole civilized world." For gallantry on this occasion Lieut. Biddle was promoted, and placed in command of the sloop-of-war "Hornet." On this ship he was blockaded, with Commodore Decatur's squadron, in New London. Escaping the blockade he sailed for the East Indies, and off the island of Tristan d'Acunha encountered the British brig "Penguin," of equal force with the "Hornet." After an action of twenty-two minutes, in which the British ship lost a third of her officers and crew killed and wounded, the "Penguin" surrendered, but was so damaged that it was necessary to scuttle her. Biddle was severely wounded in the neck, and on his return to the United States was promoted to the rank of captain.

After the termination of the war he was constantly employed both in the ordinary routine of duty and also upon special services of more importance. In 1817 he took possession of Oregon Territory; in 1826 he signed a commercial treaty with Turkey. From 1838 to 1842 he was governor of the Naval Asylum, Philadelphia; and at his suggestion Secretary Paulding sent thither unemployed midshipmen for instruction, thus laying the foundation of a naval school. His last cruise was in command of a squadron in the East Indies. After exchanging the ratifications of the first treaty with China, in 1845, he touched at Japan, and was for a short time in command on the coast of California during the Mexican war. He died in Philadelphia in October, 1848.

Biddle, Nicholas, Captain U.S.N. An officer of the Colonial period. In command of the "Andrew Doria," of 14 guns, he displayed great activity, zeal, and intelligence. He made a number of prizes, and had at an early period raised the expectations of his friends to such a height that by many of them he was pronounced, and probably justly, not to have his superior in merit in the service. While cruising near the banks of Newfoundland he intercepted two transports, with 400 Highland troops on board, and was so successful in making captures that it is said he returned to the Delaware with five only of the men which composed his crew when he last left that river. He had distributed them among the captured, and received in return such of the crews of his prizes as were disposed to enter the Continental service. Capt. Biddle was appointed by Congress (June 6, 1776) to command one of the frigates then building in Philadelphia,—the "Randolph," of 32 guns. In February, 1777, she sailed on a cruise. In a few days a defect discovered in his masts induced him to put into Charleston, S. C., to repair them. Having refitted, he again sailed, and three days after being out he fell in with four vessels from Jamaica, one of them, the "True Briton," of 20 guns. Having captured the whole four, he returned with them to Charleston. This success gave such animation and encouragement to the State authorities of South Carolina that they fitted out four small vessels of war ("General Moultrie," "Fair American," "Polly," and "Notre Dame"), and placed them under the orders of Capt. Biddle. The immediate object was an attack upon the "Carrysfort," 32, the "Perseus," 24, the "Hinchinbrook," 16, and a privateer then cruising off Charleston. The bar of Charleston and adverse winds detained Capt. Biddle so long in Rebellion Road, that when he got to sea the British cruisers had disappeared. He captured a small schooner, and proceeded on his cruise till, between 8 and 9 o'clock at night of March 7, 1778, he fell in with the "Yarmouth," Capt. Vincent, of 64 guns. An action immediately commenced by a broadside from the "Randolph," and was maintained with great energy for twenty minutes or more, when the "Randolph" blew up, and the gallant Biddle, with 310 of his crew, perished in a blaze of glory. Four only of his men escaped, and they were picked up by the "Yarmouth" four days after the action, having supported themselves on a piece of the wreck, without anything to subsist on or quench their thirst excepting rain-water sucked from a blanket, which they had providently preserved.

Bid-hook. A small kind of boat-hook.

Biel-brief. The bottomry contract in Denmark, Sweden, and the north of Germany.

Bierling. An old name for a small galley.

Bifurcate. A river is said to bifurcate, or to form a fork, when it divides into two distinct branches, as at the heads of deltas and in fluvial basins.

Bight. The loop of a rope. A bend of the coast forming a wide-mouthed bay.

Bilander. A small merchant vessel with two masts, particularly distinguished by the form of her mainsail. It is bent to the whole length of the yard, hangs fore-and-aft, and is inclined at an angle of 45° to the horizon. Few vessels are now rigged in this manner, and the name is indiscriminately used.

Bilbo. An old term for a flexible kind of cutlass from Bilboa, where the best Spanish sword-blades were made.

Bilboa. A city and seaport of Spain, on the Nerva, 6 miles from its mouth. Lat. 40° 14′ 3″ N.; lon. 2° 56′ 5″ W. Bilboa has large rope-walks and docks for ship-building, and the anchors for the Spanish navy are here manufactured. Pop. 27,000.

Bilboes. Bolts and shackles used by the Spanish to confine the legs of their prisoners.

Bilge, or Bulge. The largest circumference of a cask. That part of the hull of a ship which approaches more nearly to a horizontal than to a vertical position. When a ship runs aground and receives an injury in this part of the hull she is said to be *bilged*. *To bilge*, in a figurative sense, means to be dropped from the service for failure to pass an examination.

BILGE-BOARD. The board covering the limbers.

BILGE-FEVER. A fever caused by the foulness of the hold.

BILGE-FREE. The situation of a cask when it

rests entirely on its beds, and the bilge is clear of everything.

Bilge-keel. A projection on the bilge of a vessel parallel with the keel. Used in flat-bottomed light-draft vessels to check the rolling.

Bilge-kelson. A timber extending fore-and-aft inside the bilge to strengthen the frame.

Bilge-plank. A strengthening plank at the bilge outside or inside.

Bilge-pump. A pump for clearing the hold of water. A small pump for drawing off the bilge-water when the ship is careened so that the water cannot make its way to the pump-well.

Bilge-water. Water that has collected in the bottom of a ship. It should be pumped out frequently, as it soon gives off an offensive odor and endangers the health of the crew.

Bilge-water Alarm. A bilge water gauge (which see), to which is an attachment that sounds an alarm when the water has risen to a certain height.

Bilge-water Discharge. An apparatus for discharging the bilge-water automatically; a tube from the pump-well through the stern, through which a current is induced by the vacuum which is formed at the rear orifice by the passage of the ship through the water.

Bilge-water Gauge. An apparatus to indicate the depth of water in the hold.

Bilge-ways. A series of timbers on either side of a vessel on the launching-ways, on which rests the cradle which supports the body of the ship in launching.

Bill. The end of a compass or knee-timber. The extremity of the arm of an anchor. A point of land, as Portland Bill. The point of a hook. See Fire-bill, Watch-Bill, Quarter-bill, and Station-bill.

Bill of Entry. A document containing an account of goods entered at a custom-house, either inward or outward.

Bill of Exchange. A note ordering the payment of a sum of money at a specified time and place, to a person therein appointed, in consideration of value received by the drawer at another.

The negotiation of inland bills of exchange, or those drawn by one person on another residing in the same country, may be effected either with or without the agency of bankers.

Usually there are three parties to a bill of exchange, viz., the drawer, the acceptor, and the indorser. When a party refuses to accept a bill drawn upon him, the holder's notary takes protest upon it, whereupon it is returned to the original drawer, who is liable in damages to the holder. Should the bill be accepted, but not paid when due, the holder's notary protests for non-payment. The acceptor is always liable to the holder; and the holder has recourse also against the drawer and the indorsers: the acceptor is liable only for the expenses of an action against himself, therefore the holder must make his election whom to sue. To preserve this recourse the earliest possible notice of the non-payment of a bill, to the drawer, and also to the indorsers, must be given. Every bill must be for payment of money only; but it does not affect the validity of a bill that its payment should depend upon some contingency, provided it be a contingency which must eventually happen, such as the death of a party now living. An alteration in the date, sum, or time of payment of a bill, will invalidate it; but it has been ruled that the words "or order" may be interlined in it. A bill may be accepted either *absolutely* or *with qualifications*. When accepted qualifiedly, it does not bind the acceptor till the contingency stipulated shall have happened. A bill may be also accepted partially, that is, it may be drawn for $200, but accepted only for $150. In all cases of conditional or partial acceptance, it is the duty of the holder, if he wish to preserve his recourse against the drawer and indorsers, to give notice to them of such partial or conditional acceptance. When a bill is made payable a certain time after sight, the holder must get the acceptor to note upon it the day when it was presented for his acceptance. Notice of the dishonoring of a bill by non-payment, or non-acceptance, should always be given to the immediate indorser, next day, through the post-office. Bills may be transferred either by delivery only or by indorsation and delivery. Bills payable to order require indorsation and delivery; but bills payable to bearer may be transferred by either mode. A special indorsement precludes the person in whose favor it is made from making a transfer. After the payment of a part, a bill may be indorsed over for the residue. If a bill is not presented for payment when due, the drawer and indorser will be exonerated from liability. If a bill fall due on Sunday, or a holiday, it must be presented for payment on the day preceding. The days of grace ought to have expired before a bill is presented for payment. No days of grace are allowed on bills payable on demand, or where no time of payment is expressed.

Bills of exchange may be drawn payable at sight, or so many days or months after date, or at *usance*, as it is termed; that is, the usual term allowed by the law of the place where the bill is payable. Most countries, however, allow a few days beyond the term of payment for settling or taking up a bill. These are called *days of grace*.

Bill of Freedom. A full pass for a neutral in time of war.

Bill of Health. A certificate properly authenticated by the consul, or other proper authority at any port, that the ship comes from a place where no contagious disorder prevails, and that none of the crew, at the time of her departure, were infected with any such distemper. Such constitutes a *clean* bill of health, in contradistinction to a *foul* bill.

Bill of Lading. A document signed by the master of a ship by which he acknowledges the receipt of a merchant's goods, and undertakes to deliver the same at the place to which they are consigned. Bills of lading are generally printed, leaving blanks to be filled in. Three sets are made out, one of which should be sent to the consignee by mail; the second transmitted to him by the vessel itself; and the third retained by the shipper. Bills of lading are transferable by indorsement. The indorsement and delivery of the bill of lading transfers the property in the goods from the time of such delivery. The *bona fide* holder of the bill, indorsed by the consignee, is entitled to the goods if he purchased the bill for a valuable consideration. Where there are several bills of lading, each is a contract in itself as to the holder of it, but the whole make only one contract as to the master and owners. If the several parts of the bill of lading

be indorsed to different persons, a competition may arise for the goods; and the rule generally is that if the equities be equal, the property passes by the bill first indorsed. See CHARTER PARTY.

Bill of Parcels. A written account, given by seller to buyer, of the quantities, sorts, and prices of goods bought.

Bill of Rights. In English law the declaration delivered by the two houses of Parliament to the Prince of Orange, February 13, 1688, at the period of his succession to the British throne, in which, after a full specification of various acts of James II. which were alleged to be illegal, the rights and privileges of the people were asserted. In the United States the term is applied to a declaration of the fundamental rights and liberties of the people which, in the shape of abstract propositions and elementary principles, forms part of the constitutions of many of the States.

Bill of Sale. See VESSELS, TITLE TO.

Bill of Sight. When an importer, from ignorance of the actual quantities or qualities of goods assigned to him, is unable to make an exact entry at the custom-house, he is allowed to make an entry by bill of sight,—that is, according to the best description that can be given. On this, the collector or comptroller is empowered to grant warrant for the landing of the goods, the importer being bound to make, within three days afterwards, a perfect entry, and either to pay down the duties or to warehouse the goods.

Bill of Store. A license granted by the custom-officers for carrying, free of duty, such stores as may be necessary for a voyage. Returned goods may be entered by a bill of store.

Bill-boards. Projections of oak plank secured to the bow of the ship abaft the cat-heads for the fluke of the anchor to rest on.

Billet. The tin tag hung above the hammock-hook on which the number is painted. An individual's situation or employment. A memorandum of the various duties and stations of a seaman, which is given to him when he first comes on board for duty.

Billet-head. A scroll-head. A round piece of wood fitted to the bow or stern of a whale-boat, around which the line is veered when the whale is struck.

Billet-wood. Small wood used for dunnage.

Bill-fish. See GAR-FISH.

Billow. A great wave or surge of the sea.

Bindings. A general term for beams, knees, clamps, transoms, and other connecting parts of a vessel.

Binding Strakes. Thick planks on the decks, running just outside the line of hatches, jogged down over the beams and ledges. The principal strakes of plank in a vessel, especially the sheer-strake and wales.

Binge. To rinse a cask.

Bingid. An old term for locker.

Bink. See BENK.

Binnacle. A case or box to contain the compass. It is fitted with a lamp to light up the card at night.

BINNACLE-LIGHT. The lamp used in a binnacle.

Binocle. A telescope adapted to the use of both eyes.

BINOCULAR TELESCOPE. A two-barreled telescope invented by Galileo in 1617, though the invention is sometimes credited to Schyrleus de Rheita.

Bior-linn. A very old word for boat.

Bird's-foot Sea-star. The *Palmipes membranaceous*, one of the *Arteriadæ*, with a flat, thin, pentagonal body, of a bright scarlet color.

Bird's-nest. A round top at a mast-head for a look-out station. A smaller crow's-nest. Chiefly used in whalers, where a constant look-out is kept for whales. See EDIBLE BIRD'S-NEST.

Bireme. In Roman antiquity, a vessel with two rows of oars.

Birt. A kind of turbot.

Birth-marks. Marks denoting the depth to which a ship may be loaded with safety.

Biscuit. Hard bread for naval use.

Bishop. A name of the great northern diver (*Colymbus glacialis*).

Bismer. A name of the stickleback (*Gasterosteus spinachia*).

Bissextile (Lat. *bis*, twice, and *sextus*, sixth). "*Leap-year.*" In the Julian calendar every fourth year consisted of 366 days. The additional day was inserted after the 24th of February, which in the Roman calendar was called "the *sixth* day before the Calends of March," and being reckoned twice over every fourth year it was called *bissextus dies*, and the year was named *Bissextilis*.

Bit. A *short bit* is equal to 12½ cents, a *long bit* to 25 cents. The term arose from the cutting of Spanish silver coins into "bits." It is still in use in the west, especially in California.

Bite. The hold which the short end of a lever has under the object to be lifted. When the fluke of an anchor enters the ground it is said to *bite*.

Bitt. To take a turn with the cable around the head of the bitts. *To double bitt* or *to weather-bitt* the cable is to take an extra turn around the head of the bitts.

Bitter. Any turn of the cable around the bitts. Hence a ship is *brought to a bitter* when the chain has run out to that point.

Bitter-end. The last end. The end of the cable not bent to the anchor.

Bitt-head. The upper part of the bitts.

Bitt-pin. A large iron pin in the head of the bitts to prevent the chain from slipping off in veering.

Bitts. Vertical timbers projecting above the decks. The bitts for the cable are circular, and are coated with iron. There are generally two pairs of them, the after pair being used for the sheet-chains. The *topsail-sheet bitts* are fixed near to, and forward of, the masts.

Bitt-stopper. A stopper used at the bitts for securing the cable. See STOPPER.

Bize. A cold wind from the summits of the Pyrenees.

Blackamoor. A thoroughly black negro.

Black-and-tan. An epithet applied to a mulatto.

Black-bird Catching. The slave-trade.

Black-birds. Negroes.

Black-fish. A name applied to many different species of cetaceans.

Black-head. The pewitt-gull (*Larus ridibundus*).

Black-hole. A place of solitary confinement.

Black Indies. Newcastle, Sunderland, and Shields.

Blacking down. The operation of tarring and blacking the rigging.

Black-jack. A piratical-looking individual. The ensign of a pirate.

Black-list. A record of misdemeanors formerly kept by officers for their private use. The list of men who are detailed for extra duty as a punishment.

Black Ship. A term applied to a ship built in India, of teak.

Black South-easter. A well-known violent wind at the Cape of Good Hope, in which vapory clouds, called the Devil's Table-cloth, appear on Table Mountain.

Black Squall. This squall may be principally ascribed to the heated state of the atmosphere near the land.

Black-strake. The range of planks just above the wales.

Black-strap. Bad port wine. The dark wines of the Mediterranean.

Black-tang. The sea-weed *Fucus vesicolosus*, or tangle.

Blackwall-hitch. A hitch made by putting the bight of a rope over the back of a hook, and jamming the end under the standing part. It is used principally for the hauling part of a tackle when there is not sufficient length to make a cat's-paw.

Black Whale. A name for the right whale of the south seas (*Balæna australis*).

Black Vomit. A copious vomiting of dark-colored matter, or the substance so discharged; one of the most fatal symptoms in yellow fever.

Blad. A term used on the northern coasts of Great Britain for a squall accompanied by rain.

Bladder-fish. A name for the tetrodon. See Balloon-fish.

Blade. The cutting part of a sword or cutlass. The part of the arm of an anchor prepared to receive the palm. One of the projecting arms of a screw-propeller. The part of an oar which is immersed in the water in rowing.

Blae, or Blea. The alburnum or sap-wood of timber.

Blake, George S., Commodore U.S.N. Born in Massachusetts. Appointed midshipman, April 23, 1818; commissioned as lieutenant, March 31, 1827; West India Squadron, 1829; survey of Narragansett Bay, 1831–33; navy-yard, Philadelphia, 1834; coast survey, 1837–48; navy-yard, Philadelphia, 1848; commissioned as commander, February 27, 1847; fleet-captain, Mediterranean Squadron, 1850–52; bureau construction, 1853–55; commissioned as captain, September 14, 1855; special duty, 1856–57; superintendent Naval Academy, 1858–65; commissioned as commodore, July 16, 1862; light-house inspector, 1866–69; died at Longwood, Mo., June 24, 1871.

Blake, Homer C., Commodore U.S.N. Born in New York, 1822. Appointed midshipman, March 2, 1840; frigate "Constellation," East India Squadron, 1841–43; sloop "Preble," coast of Africa, 1843–45; naval school, 1846; sloop "Preble," Pacific Squadron, 1846–48.

Promoted to passed midshipman, July 11, 1846; receiving-ship, New York, 1849–50; frigate "Raritan," Pacific Squadron, 1850–52; receiving-ship, Boston, 1853–56.

Commissioned as lieutenant, September 14, 1855; frigate "St. Lawrence," Brazil Squadron, 1857–59; frigate "Sabine," Home Squadron, 1861–62.

Commissioned as lieutenant-commander, July 16, 1862; commanding steamer "Hatteras," Western Gulf Blockading Squadron, 1862–63. On January 11, 1863, the "Hatteras," while at anchor off Galveston, Texas, was ordered by signal from the "Brooklyn," flag-ship of the division blockading Galveston, to chase a sail to the southward and eastward. Commander Blake at once obeyed the signal, and steamed at all speed in the direction indicated, and rapidly gained upon the suspicious vessel, which was discovered to be a steamer. When within about four miles of the vessel, it was observed that she had ceased to steam, and was lying "broadside on," awaiting the approach of the "Hatteras." When at about the distance of seventy-five yards, Commander Blake hailed, and asked, "What steamer is that?" The reply was, "Her Britannic Majesty's ship 'Vixen.'" Commander Blake ordered a boat to be sent aboard, but before the order could be obeyed, the commander of the strange craft hailed and said, "We are the Confederate steamer 'Alabama,'" which was accompanied by a broadside. The "Hatteras" returned the fire almost instantly, and steamed directly for the "Alabama" in the hope to carry her by boarding; but the attempt was defeated by the commander of the piratical craft. At length a shell entered the hold of the "Hatteras," and at the same instant another shell passed through the "sick bay," exploding in an adjoining compartment, and setting fire to the vessel. Still another shell entered the cylinder, filling the engine-room and deck with steam, and depriving Commander Blake of all power to manœuvre his vessel or work the pumps, upon which the reduction of the fire depended. With the vessel on fire in two places and her engine disabled, Commander Blake felt that it was useless to sacrifice the lives of his command, and so ordered a lee gun to be fired. The "Alabama" then asked if assistance was desired, to which an affirmative answer was given. After considerable delay, the "Alabama" sent assistance, and the crew and officers of the "Hatteras" were transferred to the "Alabama." Ten minutes after the crew left her decks, the "Hatteras" went down bow first. The battery upon the "Alabama" brought into action against the "Hatteras" numbered seven guns, consisting of four long 32-pounders, one 100-pounder rifled gun, one 68-pounder, and one 24-pounder rifled gun. The guns used in the action by the "Hatteras" were two short 32-pounders, one 30-pounder rifled Parrot, and one 20-pounder rifled gun. The action was fought at a distance of about seventy-five yards. The crew of the "Hatteras" was landed at Port Royal, Jamaica, and was with all dispatch conveyed from Port Royal to Kingston, under the guidance of the American vice-consul, John N. Camp. Commanding steamer "Utah," North Atlantic Blockading Squadron, 1863–65; shelled three divisions of rebel army at Malvern Hill, 1864; assisted to repulse an attack of the rebels on the right of the army of the James, October, 1864; engagement with rebel batteries at Trent Reach, James River, 1865; navy-yard, Portsmouth, N. H., 1866–68.

Commissioned as commander, March 3, 1866;

commanding steam-sloop "Swatara," European Squadron, 1868–69; commanding steam-sloop "Alaska," Asiatic Fleet, 1870–72.

Commissioned as captain, May 25, 1871; commanding naval rendezvous, New York, 1873–78.

Promoted to commodore, 1880, and died in February of that year.

Blake, Robert. Born at Bridgewater, in Somersetshire, in 1599. In the annals of the Commonwealth of England few names stand higher than that of this bold seaman. He was appointed for his pre-eminent ability and singular intrepidity "General of the Sea" in 1649, yet he was fifty years of age before he became a sailor. One of his earliest exploits was the defeat of Prince Rupert's fleet on the Tagus in 1651. In 1652 he gained a victory over Van Tromp after a running fight of three days. The piratical Tunisians had no mercy at his hands. His greatest achievement was at Santa Cruz, in 1657. The Spaniards, with several treasure-ships, were, as they supposed, impregnable within the fortified harbor; but Blake dashed in, faced the fire of the castle, silenced the smaller redoubts, and, seizing the richly-laden galleons, sailed out without the loss of a single ship. It was truly said of him that "it would have been hard to find the thing which Blake dared not do." Died at Plymouth, August 17, 1657.

Blakeley, Johnston, Captain U.S.N. Born at Seaford, county Down, Ireland, October, 1781; lost at sea in 1814. His father emigrated to Wilmington, N. C. The members of his family dying one by one, he was left alone in the world, and had also the misfortune to lose the little remnant of their property. A friend gave him an education, and procured for him a midshipman's warrant, February 5, 1800. Made lieutenant, February 10, 1807; master-commander, July 24, 1813; captain, November 24, 1814. In 1813 he commanded the brig "Enterprise," and did good service in protecting our coasting trade. In August he was appointed to "The Wasp," in which, June 28, 1814, he captured, after an action of nineteen minutes, in latitude 48° 36′ north, H. B. M. ship "Reindeer," which he was obliged to burn. This severe action showed the manifest superiority of American gunnery. The "Reindeer" made three attempts to board, in the last of which her gallant commander was slain. For this exploit Congress voted him a gold medal with suitable devices. September 1, 1814, in a severe action with the brig "Avon," he compelled her to strike; but the approach of another enemy prevented his taking possession of her. "The Wasp" was afterward spoken off the Western Isles, and on September 21 captured the brig "Atalanta," which arrived safely in Savannah, and brought the last direct intelligence ever received from "The Wasp." Being heavily armed and sparred, and very deep-waisted, she probably foundered in a gale. His only child, a daughter, was educated at the expense of the State of North Carolina.

Blank. The white mark in the centre of a target. See Point-blank and Cartridge.

Blanket. The layer of blubber under the skin of a whale.

Blare. To bellow or roar vehemently. A mixture of hair and tar, used for calking the seams of boats.

Blarney. Idle discourse; obsequious flattery.

Blashy. Watery or dirty; as, a *blashy* day. In parlance, trifling, flimsy.

Blast. A sudden and violent gust of wind.

Blast-engine. An apparatus for urging the fire of a furnace. A ventilating machine to draw off the foul air from a ship's hold and force fresh air into it.

Blast-furnace. A furnace in which the supply of air is furnished by a pneumatic apparatus.

Blast-pipe. A pipe to convey steam into the smoke-stack to aid the draft.

Blather. Thin mud; idle nonsense.

Blay. A name of the bleak (which see).

Blazer. A term applied to a mortar-vessel, from the great emission of flame when the mortar is fired.

Blazing-star. A popular name for a comet.

Bleak. The *Leuciscus alburnus* of naturalists, and the fresh-water sprat of Izaak Walton. The name of this fish is from the Anglo-Saxon *blican*, owing to its shining whiteness,—its lustrous scales having long been used in the manufacture of false pearls.

Bleed the Buoys. To let the water out.

Bleeding the Monkey. The monkey was a tall pyramidal kid or bucket, which conveyed the grog from the grog-tub to the mess,—stealing from this *in transitu* was termed *bleeding the monkey*.

Blenny. A small acanthopterygious fish (*Blennius*).

Blether-head. A blockhead.

Blethering. Talking idle nonsense; insolent prate.

Blind. A name on the west coast of Scotland for the pogge, or miller's-thumb (*Cottus cataphractus*).

Blind-bucklers. Those fitted for the hawse-holes, which have no aperture for the cable, and used at sea to prevent the water coming in.

Blind-harbor. One, the entrance of which is so shut in as not readily to be perceived.

Blind-rock. One lying just under the surface of the water, so as not to be visible in calms.

Blind-shell. A shell with a large fuse-hole and filled with composition, to indicate the range at night. A shell which does not explode.

Blind-stakes. A sort of river-weir.

Blink. A term in Greenland for *iceberg*.

Blink of the Ice. The reflection of an iceberg in the air above it.

Blirt. A gust of wind and rain.

Bloat. To dry by smoke; a method applied almost exclusively to cure herrings. *Bloated* is also applied to any half-dried fish.

Bloater. A herring dried by smoke.

Blocco. Paper and hair used in calking a vessel's bottom.

Block. The large piece of timber out of which a figure-head is carved. One of the transverse timbers on which a ship is built or placed for repairs. A flat oval piece of wood containing one or more sheaves. *Blocks* are used either to gain an increase of power or to give a rope a fair lead. A block consists of the *shell*, *sheave*, *pin*, and *strap*. The *shell* is the frame or outside part, and is made of ash or elm. In the *morticed* block the shell is composed of but one piece of wood; in the *made* block it consists of two or more pieces pinned together, the two principal outside pieces being called *cheeks*. On the sides and at each end of the shell is cut a single or a double *score*,

which allows the strap to set snugly on the block and prevents it from slipping off. The size of a block is determined by the length of the shell. The *sheave* is the wheel over which the rope runs, and is made of metal or lignum-vitæ. It has a hole in the centre to receive the *pin*. In a lignum-vitæ sheave this hole is generally *bouched*, or lined with metal, to decrease the friction and to protect the sheave from chafe. *Friction rollers* are sometimes inserted in the sheave when it is not to be subjected to a very great strain. Around the circumference of the sheave a *groove* is cut, which serves to retain the rope in place and prevent it from chafing against the shell. The *pin* is the bolt through the shell and sheave on which the latter revolves. The *strap* is a rope which encircles the shell, and by which it is attached to its particular place. The *swallow* is the aperture through which the rope reeves. The *hook* is attached to the strap, and is prevented from chafing by means of a *thimble*. Two of these thimbles joined together are called *lock-thimbles*. The *breech* is the end of the block farthest from the hook. The *becket* is a small grommet to which the standing part of the fall is made fast. Blocks are *single*, *double*, *threefold*, or *fourfold*, according to the number of their sheaves, and vary in size from four to thirty inches. Iron blocks, and wooden blocks with iron straps, are now coming more generally into use. Under the general head of blocks come hearts, collar-hearts, dead-eyes, bull's-eyes, wooden thimbles, fair-leaders, euphroes, cleats, cavils, wooden belaying-pins, wooden rollers, chocks, toggles, travelers, wooden hanks, hoops, trucks, etc. (which see under their proper heads). Blocks receive their names from some peculiarity of form, from the position they occupy, or from the rope leading through them. For description of blocks, see under the following heads: BEE-BLOCKS, or BEES, BRAIL-, CAT-, CHEEK-, CLEW-GARNET-, CLEWLINE-, CHUNK-, CLUMP-, D-, DASHER-, DOUBLE-, FIDDLE-, FISH-, FIXED-, FLY-, GIRT-LINE-, GIN-, GUN-TACKLE-, HANGING-, JACK-, JEER-, JEWEL-, LONG-TACKLE-, MONKEY-, NINE-PIN-, NIB-, PATENT-, QUARTER-, RUNNING-, RACK-, SHOE-, SPAN-, SPRING-, SINGLE-, SHOULDER-, SISTER-, SECRET-, STANDING-, SNATCH-, TELEGRAPH-, TREBLE-, TAIL-, TOP-, TYE-, VIOL-, and WARPING-BLOCK.

Blockade. The shutting up of a port or ports by troops or ships, so as to prevent egress or ingress, or the reception of supplies. To constitute a blockade the investing power must be able to apply its force to every point of practicable access, so as to render it dangerous to attempt to enter or depart. See INTERNATIONAL LAW.

Block-and-block. An expression denoting that the two blocks of a tackle have been drawn together, and that the tackle is inoperative. Synonymous with *two-blocks* and *chock-a-block*.

Blockmaker. A manufacturer of blocks.

Blockmaking Machine. The first set of machinery for making blocks was invented by Brunel early in the present century, and was set up at Portsmouth, England, in 1808. The saving in the cost of blocks is about $100,000 per annum.

Blood-sucker. A skulker; one who throws his proportion of work on the shoulders of his shipmates.

Bloody. A slang superlative, principally used by Englishmen.

Bloody Flag. A large red flag.

Bloom. A warm blast of wind. A mass of iron which has been deprived of its dross by squeezing or shingling.

Blore. An old word for a stiff gale.

Blouse. A light single-breasted sack-coat.

Blout. A name to denote the sudden breaking up of a gale.

Blow. A gale of wind. The moving of the air; as, the winds *blow*. A violent stroke of the hand, or any instrument. To eject wind from the mouth; hence the term as applied to the breathing of cetaceans,—the air expelled from the lungs, being heavily charged with moisture, condenses on contact with the atmosphere, and appears like a column of steam. *There she blows!* the cry of the look-out when a whale is sighted.

Blowe. An old word for *scold;* hence the term "blowing-up" for a reprimand.

Blow-holes. The nostrils of the cetaceans. In some species they are slits placed side by side; in others there is but one opening.

Blow Home. The wind does not *blow home* when its course is diverted by a chain of mountains or other obstacle.

Blowing Great Guns. An expression to denote a violent gale.

Blowing Off. The operation of ejecting from the boiler the water which has become saturated with salt, to prevent the formation of scale.

Blowing the Grampus. Throwing water over a sleeper on watch.

Blowing Through. The operation of clearing the valves, cylinders, and condenser of air before starting the engine.

Blowing Weather. A term to signify a continuance of strong gales.

Blow-off Pipe. A pipe leading from the bottom of the boiler to convey the sediment overboard.

Blown. Half-dried; applied to cod and herrings.

Blown Itself Out. A gale is said to have *blown itself out* when its energy is expended.

Blow-out. A jollification or spree.

Blow-pipe. An engine of offense used by the Araucanians and Borneans, and with the latter termed *sumpitan:* the poisoned arrow, *sumpit*, will wound at the distance of 140 or more yards. The arrow is forced through by the forcible and sudden exertion of the lungs. A wafer can be hit at 30 yards to a certainty, and small birds are unerringly stunned at 30 yards by pellets of clay.

Blow the Gaff. To reveal a secret; to expose or inform against a person.

Blow-through Valve. A valve admitting steam into the cylinder and condenser, in order to clear them of air and water before starting the engine.

Blow Up. To abuse angrily.

Blow-valve. The snifting-valve. The valve which permits the steam to escape on *blowing through*.

Blubber. The layer of fat in whales between the skin and the flesh, varying from 10 to 20 inches in thickness, which is flinched or peeled off, and boiled for oil. See SEA-BLUBBER.

Blubber-forks and Choppers. The implements with which blubber is "made off," or cut for stowing away.

Blubber-guy. A large rope stretched from the main- to the foremast-head of whalers, to which the speck-falls are attached for the operation of flensing.

Blue. *Till all's blue:* carried to the utmost,—a phrase borrowed from the idea of a vessel making out of port, and getting into blue water. *To look blue*, to be surprised, disappointed, or taken aback, with a countenance expressive of displeasure.

Blue-book. The name by which the book containing the regulations for the navy is known; also, a book containing the names of all persons in the employ of the United States government, with the amount of their pay.

Blue-jackets. The seamen as distinguished from the marines.

Blue-light. A pyrotechnical preparation for signals by night. Also called Bengal light.

Blue-lightism. Affected sanctimoniousness.

Blue Moon. An indefinite period.

Blue-nose. A native of Nova Scotia, or a Nova Scotian vessel.

Blue Peter. A flag with a blue ground and a white centre, which, when hoisted at the fore, denotes that the ship is ready to sail. It corresponds to the cornet in the navy.

Blue Pigeon. A nickname for the sounding lead.

Blue Water. The open ocean.

Bluff. An abrupt highland, projecting almost perpendicularly into the sea, and presenting a bold front, rather rounded than cliffy in outline.

Bluff-bowed. Applied to a vessel that has broad and flat bows,—that is, full and square formed; the opposite of lean.

Bluff-headed. Built with the stem nearly straight up-and-down.

Blunderbuss. A short fire-arm with a large bore and wide mouth.

Blunk. A sudden squall.

Blustrous. Stormy.

Boadnash. Buckhemshein coins of Barbary.

Boanga. A Malay piratical vessel impelled by oars.

Board. A piece of sawed timber relatively broad and thin. The terms *board* and *plank* are often indiscriminately used. See Plank.

The deck or interior of a vessel. To *board* a vessel is to enter either in a friendly or a hostile manner.

The side of a vessel. *Overboard*, over the side, in the water. *In-board*, inside, or farther from the side. *Out-board*, nearer to the side. *Board to board*, or *board and board*, side by side.

The stretch which a ship makes on one tack in beating to windward. To make a *good board*, to lose little or nothing to leeward. To make *short boards*, to tack frequently. When a ship luffs up into the wind until the headway has nearly ceased, and is then made to pay off on the same tack, she is said to make a *half-board;* with smooth water and a good working breeze a ship can eat her way up to windward in this manner. When the vessel goes astern she makes a *stern-board.* It is advisable in this case not to put the helm hard over, as great strain would be brought on the rudder.

A word applied to certain individuals in a collective capacity who are appointed by competent authority for the management of some public office or trust; as, The Light-house Board (which see); or to perform certain specified duties; as, The Board for the Examination of Officers for Promotion and Retirement (which see), and The Board of Inspection (which see). There are also boards convened from time to time for the purpose of collating facts and expressing opinions, of an advisory character, respecting the matters submitted to them by the convening authority.

Board, The Academic. The collective designation of the heads of the departments of instruction at the Naval Academy.

Boarders. The men detailed to attack the enemy by boarding. They are armed with pistols and cutlasses, and are led by the executive-officer. They are summoned by verbal order and by the springing of the rattle, and assemble in the part of the ship designated, keeping under cover as much as possible.

Boarding. The act of entering a vessel, either with hostile intent or in a friendly manner.

In boarding with hostile intent the way is cleared for the boarders by a brisk fire from the rifles and machine-guns, by hand-grenades, and by streams of hot water from the steam-pumps. The great guns are depressed, and, at the order *board the enemy*, the boarders gain the enemy's deck as quickly as possible, and use every endeavor to clear the decks by disabling or driving the men below. While the boarders are absent from their guns, the remaining men keep up as rapid a fire as is possible under the circumstances, and the ports of the guns not in use are closed.

If the boarders are driven back they rally on the flanks of the riflemen, taking care to get quickly out of the line of their fire.

If the enemy manifest a disposition to board, the marines and riflemen are called away, and open fire from favorable positions, and the great guns, howitzers, and machine-guns are brought to bear on the enemy's boarders. Every effort should be made to shake or disperse them, and, if not successful, it will be necessary, before the enemy closes, to call *all hands repel boarders.* The marines and riflemen form on the side which is engaged, opposite to the point where the enemy is likely to attempt to enter, the boarders being on the flank and in the rear. The reserves are posted in the rear of the flanks of the riflemen. If the enemy gain a footing he must be charged in force, as the necessity for driving him back at once is absolute. Rallying-points should be designated, and barricades should be constructed. The shaft of a paddle-wheel vessel, or a gun run in to a taut breeching, affords a good shelter.

When at close quarters the sword is a more effective weapon than the rifle and bayonet, in which case the bayonets are unfixed and used as swords.

When there is a possibility of being boarded, boarding-nettings are got up, and the torpedoes are got ready for use.

Boarding a Vessel under Sail. Board to leeward, and do not go alongside while she has stern-way on. See that the line by which the boat rides is long enough to permit the boat to rise and fall with the sea. The line should not be belayed, but kept in hand ready for shipping. Be careful that the masts or oars do not take under the quarter-boats or chains.

Boarding a Wreck. The chief dangers to

be apprehended in boarding a wreck are the collision of the boat with the ship, or with floating spars, and the swamping of the boat alongside. The greater violence of the sea on the weather side makes it preferable to board to leeward. The dangers to be guarded against in boarding on the lee side are the falling of the masts and collision with floating spars.

The large life-boats that go off to wrecks anchor to windward and veer down, care being taken to prevent actual contact.

BOARDING-BOOK. A book in which are entered the particulars in regard to every ship boarded. It is not taken on board men-of-war, but the particulars are afterwards registered.

BOARDING-NETTINGS. A network of wire ropes or hemp ropes soaked in tar and sanded, to prevent boarders from entering a ship. The lower edge is made fast to the rail, and the upper edge triced up by whips or stopped to the ridge-rope.

BOARDING-PIKE. A defensive lance against boarders.

BOARD IN THE SMOKE. A figurative expression, signifying to create confusion or enthusiasm, and then to endeavor to attain one's object before the effect has passed away. The expression arose from the custom of delivering a broadside as the boarders were thrown upon the enemy's decks.

Boardling (*Eng.*). A flippant understrapper of the admiralty or navy-board.

Board of Trade. See TRADE, BOARD OF.

Boat. A small open vessel, propelled by oars or sails, and sometimes by steam. The name is also applied to large river-craft propelled entirely by steam, and also to a vessel having no motive power of its own; as, a *canal-boat*. Boats are built of various materials; as, wood, iron, paper, etc. Wood is used for boats for ordinary purposes, iron for heavy boats, and wood or paper for racing-boats.

The frame of a *carvel-built* boat generally consists of a floor and two futtocks, and the planks do not overlap, but make flush seams, which are calked. In the *clinker-built* boat the lower edge of each plank laps over the upper edge of the one next below. A *diagonal-built* boat is one in which the outer skin consists of two layers of planking at right angles to each other, and making an angle of 45° with the keel.

Boats are square-sterned, or sharp at both ends; in the latter case they are called whale-boats. *Single-banked* boats have one oarsman to each thwart, and a *double-banked* boat has two. *Oars* are double-banked when each oar is pulled by two men.

The boats in use in the navy are as follows: steam-launches, steam-cutters, launches, cutters, whale-boats, dingys, barges, and gigs. For a description of these various boats, with their various rigs, see under the proper heads. See LIFE-BOATS.

Up boats, the order to hoist all the boats. *To secure a boat for sea*, to rig in the davits, and pass the gripes around the boat and strong-back. *To call away a boat*, to pass the word for the crew to man their boat. *To trim boat*, to so dispose the weight in her that she shall float upright. *To bail a boat*, to throw out the water that may be in her. *To moor a boat*, to secure it at a buoy or wharf. *To wind a boat*, to slue it around end for end. *To man a boat*, to send the crew in it to manage it. *To boat the oars*, to place them on the thwarts fore-and-aft ready for use.

Boats, Equipment of.

RUNNING-BOATS, or boats which do the ordinary duty of a ship, are supplied with oars, boat-hooks, fenders, breaker, anchor, colors, cushions, painter, etc. Masts, sails, compass, and awnings will be carried as ordered.

ARMED BOATS are equipped according to the nature of the service they are to perform.

DISTANT SERVICE. The boat is supplied with provisions, fuel, cooking utensils, ammunition, arms and accoutrements, tools and articles for repairing damages, boat-gear, means of making signals, and a medical outfit. If a gun is carried, ammunition and implements for the service of the piece afloat are supplied.

CUTTING OUT VESSELS, OR CONTENDING WITH OTHER BOATS. The boat is supplied with ammunition, arms and accoutrements, tools and articles for repairing damages, medical outfit, means of making signals, a small quantity of provisions, and as many men as can be carried without undue crowding. If a gun is carried, ammunition and implements for the service of the piece afloat are supplied. See CUTTING OUT.

LANDING WHERE LIKELY TO BE OPPOSED. The boat is supplied with ammunition, arms, and accoutrements, tools and articles for repairing damages, and a small quantity of provisions. No masts or sails are carried. If a gun is carried, ammunition and implements for the service of the piece afloat and ashore are supplied. For more minute details, see ORDNANCE INSTRUCTIONS, 1880.

Boats, Management of.

UNDER OARS. Before leaving the ship see that she is properly equipped for the service on which she may be going. Do not shove off during stern-way. Trim the boat. Keep the weights amidships. Do not allow the men to stand up in the boat, or to sit on the gunwale. Sand is much heavier when wet than when dry, therefore do not overload the boat with it. Water in breakers is safest for ballast; iron or sand stows better, but in the event of a capsize would sink the boat. A loaded boat holds her way longer than when light. Make due allowance for the tide; a little judgment may save a long pull. Keep clear of a vessel with stern-way on. Keep a boat bows-on to a heavy sea. A boat may ride out a heavy gale by lashing the spars, sails, etc., together and riding to leeward of them. See BOARDING, KEDGING, ROWING, SURF, SALUTES, TOWING, and WARPING.

UNDER SAIL. When the ship is not head to wind, pull well clear of the ship before making sail. Hoist the jib before the foresail, that the mast-head may not be dragged aft. Do not belay the sheets, but keep them in hand. Running before a stiff breeze, reduce sail before luffing up. Running dead before the wind in a light boat is dangerous; it is safer to run half the distance with the wind on one quarter, and then bring the wind on the other quarter. In a moderate squall ease the sheets; in a hard squall luff up and lower the sails. If there be any doubt about weathering a point, go about at once. If there be any doubt about going around, have an oar ready to leeward. If the men are sitting to windward, make them sit amidships on

passing to leeward of a ship. In a stiff breeze get the masts down before going alongside of a ship.

BOATABLE. Navigable for boats.

BOAT-CHOCKS. Pieces of wood on which boats rest when stowed on deck.

BOAT-CLOAK. A mantle for the use of officers in a boat.

BOAT-DAVIT. The name applied to the timbers which project over the side or stern of a vessel, and to which the boats are hoisted.

BOAT-DRILL. The objects of boat-drill are as follows: *first*, to accustom the men to rowing and to the handling of boats under sail (see MANAGEMENT OF BOATS); *second*, to instruct the men in the manipulation of boat-guns (see HOWITZER); *third*, to familiarize the men with their duties in providing articles for the equipment of boats (see EQUIPMENT OF BOATS); *fourth*, to familiarize the officers and quartermasters with making and reading signals (see SIGNALS); and, *fifth*, to familiarize the officers with the principles of fleet tactics. The tactics for boats under sail are the same as for vessels under canvas, and when the boats are under oars they conform to the rules laid down for the regulation of vessels under steam. See NAVAL TACTICS.

BOAT-FAST. The rope by which a boat is made fast.

BOAT-GEAR. The rigging and furniture of a boat.

BOAT-HIRE. Expenses for the use of shore-boats.

BOAT-HOOK. A staff fitted with an iron or brass head, used in a boat when alongside of a wharf or a ship.

BOATILA. A narrow-sterned, flat-bottomed boat of the Gulf of Manar.

BOATING. Transporting men, munitions, or goods by boats.

BOAT-KEEPER. One of the boat's crew who remains in charge during the absence of the others.

BOAT-LINE. See BOAT-ROPE.

BOAT-ROPE. A rope by which a boat is towed. A rope fitted to a boat to assist in managing it when lowered in a sea-way.

BOAT'S-CREW. The men detailed for duty in a particular boat.

BOAT'S-GRIPES. Lashings for securing davit-boats at sea.

BOAT-SKIDS. Skids to keep a boat clear of the ship's side in hoisting or lowering.

Boatswain (Fr. *maitre d'équipage*). Formerly pronounced and sometimes written bote-son, or boat's-son, and bo'sun, is in the Spanish and Portuguese navies styled "Master of the Canvass." The title is said to be derived from *bat*, a boat, and *swân*, a swain, or servant. His symbol of office—the silver call, or whistle—was once the proud insignia of the Lord High Admiral of England, and the decorative appendage of the Admirals of the Fleet, who wore it suspended from a golden chain, and with it "were wont to cheer their men in battle." The duties of a boatswain are constant and fatiguing; his station is the forecastle, whence he can direct the men aloft. He pipes "all hands" for general work, and his mates repeat the call on their respective decks. Boatswains in the United States navy are warrant-officers, and their principal duties are as follows:

The boatswain is to be generally upon deck during the day, and at all times when any duty shall require all hands to be employed. He is with his mates to see that the men go quickly upon deck when called, and that they perform their duty with alacrity. He will every day at 7.30 A.M., and at such other times as directed, examine the rigging, and report to the officer of the deck the state in which he finds it. He is to be careful that the anchors, booms, and boats are properly secured, and is to have ready a sufficient number of mats, plats, nippers, points, and gaskets, that no delay may be experienced. He will be careful that the masts of the ship are not crippled or strained in setting up the stays and rigging, and that they retain the same angle with the keel after the stays and rigging are set up that they had when they were only wedged. He is to see when junk is worked up that every part is applied to the purposes ordered. When preparing for battle, he is to see that everything necessary for repairing the rigging is in place.

BOATSWAIN-BIRD (*Phæton æthereus*). A tropical bird, so called from the whistling noise it makes. It has two long feathers in its tail, called the marling-spike.

BOATSWAIN-CAPTAIN. A term applied to a commanding officer who pays great attention to the minor details which are generally attended to by the boatswain.

BOATSWAIN'S MATE. The chief petty officer of the watch. He passes all the orders of the officer of the watch, and uses his call as circumstances require.

BOATSWAIN'S STORE-ROOM. An apartment for the boatswain's stores.

Boat the Oars. To place the oars fore-and-aft on the thwarts ready for use.

Bob. The ball or balance-weight of a clock's pendulum; the weight attached to the plumb-line. To fish. A knot of worms on a string, used in fishing for eels; also colloquially, it means a berth. *Shift your bob*, to move about, to dodge. *Bear a bob*, make haste, be brisk.

Bobbery. A disturbance, row, or squabble; a term much used in the East Indies and China.

Bobbing. A particular method of fishing for eels.

Bobbing About. Heaving and setting without making any way.

Bobble. The state of waves when dashing about without any regular set or direction, as in cross tides or currents.

Bobstay. A rope or chain extending from the bowsprit to the cutwater. Its use is to counteract the strain of the head-stays. The bowsprit is also fortified by shrouds from the bows on each side, which are all very necessary, as the foremast and the upper spars on the mainmast are stayed and greatly supported by the bowsprit.

BOBSTAY-COLLARS. These are made with large rope, and an eye spliced in each end; they are secured round the bowsprit, on the upper side, with a rose lashing. They are almost entirely superseded by iron bands.

BOBSTAY-HOLES. Those cut through the forepart of the knee of the head, between the cheeks, for the admission of the bobstay; they are not much used now, as chain bobstays are almost universal, which are secured to plates by shackles.

BOBSTAY-PIECE. A piece of timber to which the bobstays are secured.

Bobstay-plates. Iron plates by which the lower end of the bobstay is attached to the stem.

Bocca (Sp. *boca*, mouth). A term used both in the Levant and on the north coast of South America, or the Spanish Main, for a mouth or channel into any port or harbor, or the entrance into a sound which has a passage out by a contrary way. *Bocca Tigris*, Canton River.

Body. The principal corps of an army, or the main strength of a fleet. The figure of a ship, abstractly considered, is divided into different parts or figures, each of which has the appellation body, as fore-body, midship-body, square-body, etc.

Body-hoops. The hoops of a made mast.

Body-plan. A plan of a ship showing the breadth; it is a transverse section of the ship at the broadest part.

Body-post. The post at the forward end of the space in which the screw revolves.

Boggs, Charles Stewart, Rear-Admiral U.S.N. Born in New Brunswick, N. J., January 28, 1811. Appointed midshipman from same State, November 1, 1826. Attached to Mediterranean Squadron,—sloop of-war "Warren" and ship-of-the-line "Delaware,"—1827–30; West India Squadron, schooner "Porpoise," from 1830–32.

Promoted to passed midshipman, April 28, 1832; receiving-ship, New York, 1832; West Indies, sloop "Falmouth," 1833–34; rendezvous, New York, 1835–36.

Promoted to lieutenant, September 6, 1837; Pacific Squadron, ship-of-the-line "North Carolina" and schooner "Enterprise," 1837–38; receiving-ship "New York," in charge of apprentices, 1840–41; coast of Africa, sloop "Saratoga," 1842–43; participated in the destruction of the Bereby village on that coast; Home Squadron, 1846–47, steamer "Princeton"; present at siege of Vera Cruz; commanded boat expedition from the "Princeton," which destroyed the U. S. brig "Truxtun" after her surrender to the Mexicans; receiving-ship, New York, 1848; executive-officer of the frigate "St. Lawrence" to the World's Fair, London, 1848; first lieutenant navy-yard, New York, and inspecting for Bureau of Provisions and Clothing, 1851–54.

Commissioned as commander, September 15, 1855; commanding United States mail-steamer "Illinois," 1856–58; light-house inspector, California, 1860–61; commanding U. S. steamer "Varuna" at the passage of Forts Jackson and St. Philip, April 24, 1862. The "Varuna" was the only vessel of Farragut's squadron lost at the passage of the forts. From her great speed she was able to get ahead of all the fleet, and engage the rebel squadron above the forts. She was attacked by two rams, and sunk after being run into the bank of the river; causing, however, the destruction of the attacking vessels.

Commissioned as captain, July 16, 1862; commanded steam-sloop "Sacramento" on the blockade of Cape Fear River; left his command on account of serious sickness; special duty under Admiral Gregory, at New York, 1864–65; superintended the construction of small steam picket-boats, and specially designed and fitted out the torpedo-boat which, under the dashing Cushing, destroyed the rebel ironclad "Albemarle"; 1866, commanded the U. S. steamer "Connecticut," special cruise in the West Indies; fell in with the rebel ironclad "Stonewall" in the harbor of Havana, and previous to her being given up to the Spanish government, demanded her surrender to the United States.

Promoted to commodore, July 25, 1866; commanded steamer "De Soto," North Atlantic Squadron, 1866–68; special duty, to report on the condition of steam-engines afloat, 1869–70; commanding light-house depot, Tompkinsville, Staten Island, and light-house inspector, third district.

Commissioned as rear-admiral, July, 1870; commanding European Fleet, 1871–72; retired, 1873.

Bogue. To fall off from the wind; to edge away to leeward. The mouth of a river.

Boiler. A close vessel in which steam is generated, to be used as the motive force in steam-engines, and for other purposes. It is usually made of wrought-iron plates, overlapping at the edges and fastened with rivets. See MARINE BOILERS.

BOILER-ALARM. An apparatus to call attention to the low level of the water in the boiler.

BOILER-FEEDER. An apparatus, usually automatic and self-regulating, for keeping the boiler supplied with water.

BOILER-FLOAT. A float which rises and falls with the water in the boiler, and which shuts off the feed-water when the water has risen to the requisite height.

BOILER-IRON. Rolled plates of iron from one-fourth to one-eighth of an inch in thickness.

BOILER-PROTECTOR. A non-conducting material to prevent the escape of heat; as, felt, lagging, etc.

Boiling, the Whole. A contemptuous expression to denote the whole number or entire quantity.

Bold Bow. A broad bluff bow.

Boldering Weather. Cloudy and thundery.

Bold Shore. A coast where the water deepening rapidly permits the near approach of ships without danger of grounding.

Bold-to. A term applied to land when the adjacent water deepens rapidly. Steep-to.

Bole. A small boat.

Bolide. A name for an aerolite.

Boline. See BOWLINE.

Bollard. A timber around which a turn of the line is taken when a whale is struck, in order that the line may be veered steadily. A vertical timber projecting above the ground, to which hawsers are secured.

Bollard-timber. Usually called *knight-head* (which see).

Bolling, or Bowling Along. Going through the water rapidly with a free wind.

Bolme. An old term for a waterman's pole or boom.

Boloto. A small boat of the Philippines and Moluccas.

Bolsters. Small cushions or bags of tarred canvas, used to preserve the stays from being chafed by the motion of the masts when the ship pitches at sea. Pieces of soft wood covered with canvas, placed on the tressle-trees for the eyes of the rigging to rest upon and prevent a sharp nip. Also pieces of oak timber fayed to the curvature of the bow, under the hawse-holes, and down upon the upper cheek, to prevent the cable from rubbing against the cheeks.

Bolt. To start off; to run away. To swallow food without chewing it. A cylindrical bar of metal. Bolts take their names from the uses to which they are applied; as, *bringing-to bolt*, *drive-bolt*, etc.; from a peculiarity of construction; as, *eye-bolt*, *ring-bolt*, etc.; from the mode of securing them; as, *screw-bolt*, *bay-bolt*, etc. For a description of bolts see under the following heads: BARB-, BAY-, BRINGING-TO-, CLINCH-, COUNTERSUNK-HEADED-, DOUBLE-ENDED-, DRIVE-, DRIFT-, EYE-, FENDER-, FLUSH-, FORELOCK-, FOX-, JAGGED-, KEY-, LEWIS-, POINTED-, RAG-, RING-, RIVETED-, ROSE-HEADED-, ROUND-HEADED-, SCARF-, SCREW-, and SET-BOLT.

BOLT OF CANVAS. A roll of canvas containing 39 yards.

BOLT-AUGER. An auger for boring holes for bolts.

BOLT-CHISEL. A cold chisel for cutting off the projecting ends of bolts.

BOLT-CUTTER. A tool for cutting off bolts. A tool for cutting the thread on bolts.

Bolt-rope. A superior quality of hemp cordage used for roping sails.

BOLT-ROPE NEEDLE. A strong needle for stitching a sail to the bolt-rope.

Bolt-sprit. See BOWSPRIT.

BOLT-STRAKE. Strakes of plank through which pass the beam fastenings.

Bomb. A hollow ball or shell of cast iron charged with powder, and furnished with a fuse so adjusted that when the bomb reaches the end of its range the fuse ignites the powder in the shell and blows it to pieces. Bombs appear to have first come into use in the wars of the Netherlands, in the 17th century. See SHELL.

BOMB-BED. The platform which supports a mortar.

BOMB-KETCH. See MORTAR VESSEL.

BOMB-SHELL. See BOMB.

BOMB VESSEL. See MORTAR VESSEL.

Bombalo. A delicate kind of sand-eel taken in quantities at Bombay.

Bombard. An ancient piece of ordnance for throwing heavy projectiles. Its bore sometimes exceeded twenty inches in diameter. There were also smaller varieties of the bombard. See ORDNANCE.

A vessel in which beer was formerly carried to soldiers on duty; whence *bum-boat* (which see).

Bombay. A city and seaport on the island of Bombay, now artificially converted into a peninsula, all of which is included in the municipal limits. Lat. 18° 56′ N.; lon. 72° 53′ E. Since the development of cotton culture in India, Bombay has largely increased in wealth and importance. It is connected by railroads with most of the large cities of India, and by steamer lines, *via* Suez, with Great Britain. On the S.W. the fort is connected by Colabba causeway with the island of Colabba, on which are the light-house, observatory, and a stone pier. The harbor of Bombay is unequaled for safety in all India. It affords good anchorage for ships of the largest burden, and it has excellent building- and other docks for ships of the first class. Pop. 700,000.

Bombo. Weak, cold punch.

Bonaventure. The old outer mizzen, long disused.

Bone. To study. *To bone up* a subject, to study it thoroughly.

Bon-grace. Junk-fenders, to hang over the bows and sides of a vessel. See BOW-GRACE.

Bonito. The *Thynnus pelamys*, a fish of the scomber family, commonly about 2 feet long, with a sharp head, small mouth, full eyes, and a regular semilunar tail.

Boni-vochil. The Hebridean name for the great northern diver (*Colymbus glacialis*).

Bonnet. An additional part laced to the foot of the jibs, or other fore-and-aft sails, in small vessels in moderate weather, to gather more wind.

Bonnet-flook. The well-known flat-fish, brill, pearl, or mouse-dab; the *Pleuronectes rhombus*.

Bony-fish. A name for the hard-head (which see).

Bony Pike (*Lepidosteus*). A genus of ganoid fishes, conspicuous by being examples of a nearly extinct type.

Booby. A well-known tropical sea-bird, *Sula fusca*, of the family *Pelecanidæ*. It is fond of resting out of the water at night, even preferring an unstable perch on the yard of a ship. The name is derived from the way in which it allows itself to be caught immediately after settling. The direction in which it flies as evening comes on often shows where land may be found.

Booby-hatch. A smaller kind of companion, but readily removable. A kind of wooden hood over a hatch, fitted with a sliding top and readily removable.

Book. A commercial term for a peculiar packing of muslins, bastas, and other stuffs. *Brought to book*, made to account.

Books. Official documents. See SHIP'S BOOKS.

Boom. A long spar used to extend or boom out the foot of a particular sail. It takes its name from the sail it extends. (See JIB-, FLYING-JIB-, STUDDING-SAIL-, SPANKER-, RING-TAIL-, and MAIN-BOOM.) The name is also applied to a chain stretched across a river or mouth of a harbor to prevent the entrance of an enemy's vessel. See FIRE-SHIPS.

Booms may be employed in the defense of harbors either by themselves, or in combination with submarine mines. The essential qualities of a boom are that it shall possess great strength and be easy to manipulate. The main cable should be of wire or chain, and is buoyed up by spars, logs, etc. A space is left between each float to give the whole structure flexibility. The boom should be moored with heavy anchors up-stream, and with heavy chains without anchors down-stream; the former to counteract the force of the current, and the latter to oppose a yielding obstacle to the shock of ramming. The boom should be moored obliquely to the current, which compels an enemy's vessel to place herself athwart the current in order to ram the boom at right angles. The boom should be protected from the enemy's boats by small mechanical mines, and should be covered by batteries on each side of the bay or river. *To boom off*, to shove off a vessel or boat with spars. *To top up a boom* is to elevate one end of it by hauling on the topping lifts. A person is said *to top up his boom* when he fortifies himself with ardent spirits.

Booms. The space between the fore- and main-masts, in which the boom-boats and spare spars are stowed.

BOOM-BOATS. Boats carried inboard and stowed in the booms.

Boom-brace. A rope extending from the outer extremity of the topmast studding-sail-boom through a tail-block in the main-rigging.

Boom-cover. The large tarpaulin, or painted canvas cover, extending over the booms and boom-boats.

Boom-irons. Metal hoops or rings on the lower and topsail yards through which the booms traverse. See Pacific-irons.

Boom-jigger. A tackle used for rigging in and out the topmast studding-sail-booms.

Boomkin. See Bumkin.

Boom-mainsail. A fore-and-aft mainsail the foot of which is spread by a boom.

Boom-tricing-line. The line which trices up the heel of a stun'sail-boom.

Boopah. A Tongatabou canoe with a single outrigger.

Boötes (Gr. *boōtēs*, a plowman). The constellation following the Great Bear, which, it is probable, originally figured as an ox or wagon. Boötes is also called *Arctophylax*, the Bear-watcher; and the bright star *α Bootis* is named *Arcturus*, which means the Bear-keeper.

Boothyr. An old word for a small river vessel.

Boot-lick. One who cringes and flatters to obtain favors.

Boot-topping. The old operation of scraping off the grass, slime, shells, etc., which adhere to the bottom, near the surface of the water, and daubing it over with a mixture of tallow, sulphur, and resin, as a temporary protection against worms. This is chiefly performed where there is no dock or convenient situation for breaming or careening, or when the hurry of a voyage renders it inconvenient to have the whole bottom properly cleansed. The term is now applied to sheathing a vessel with planking over felt.

Booty. That sort of prize which may be distributed at the capstan-head, or at once.

Booze. A carouse; hence, *boozy*, elevated by liquor.

Bora. A very violent wind experienced in the upper part of the Adriatic Sea, but which fortunately is of no great duration.

Borasca. A storm, with thunder and lightning.

Bord. The sea-coast, an old term. Formerly meant the side, edge, or brim; hence, as applied to a ship, *to throw overboard* is to cast anything over the side of the vessel.

Borda, Jean Charles, a scientific French navigator, born at Dax, May 4, 1733; died in Paris, February 20, 1799. He was a teacher of mathematics; became a captain in the French navy, and by his scientific knowledge was of great service to the Count d'Estaing during the American war, in which he commanded the "Solitaire" with distinction. Made a member of the Academy of Sciences in 1756. In 1771 he made a voyage to America for scientific purposes, and again in 1774, and at a later period, of which he published an account in 1778. He founded the School of Naval Architecture in France, invented nautical instruments, was one of the scientific men who framed the French metric system, and published some treatises on hydraulics. Member of the French Institute.

Bordeaux. A city in the S.W. of France, on the Garonne, 60 miles from its mouth, and chiefly on its left bank. Lat. 44° 50′ 19″ N.; lon. 0° 34′ 32″ W. Situated on a navigable river, in this part 2600 feet wide and from 60 to 90 feet deep, Bordeaux takes rank next after Marseilles and Havre among the ports of France both in foreign and coastwise trade. Its harbor or basin, formed by the Garonne, is capable of containing 1200 ships of the largest size, and is accessible for vessels of 600 tons at all times of the tide. It has docks and building-yards for every size of vessels. Its principal exports are wines, brandy, and fruits. Pop. 225,000.

Bordels. An old word for houses built along a strand.

Bord You. A saying of a man waiting, to one who is drinking, meaning that he claims the next turn.

Bore. The cavity, generally cylindrical in shape, of a piece of ordnance; also, the diameter of this cavity. A sudden and rapid flow of tide in certain inlets of the sea; as, the monstrous wave in the river Hoogly, called *bahu* by the natives, which rolls in with the noise of distant thunder at flood-tide. It occurs from February to November, at the new and full moon. Its cause has not been clearly defined, although it probably arises from the currents during spring-tides, acting on a peculiar conformation of the banks and bed of the river; it strikes invariably on the same part of the banks, majestically rolling over to one side, and passing on diagonally to the other with impetuous violence. The bore also occurs in England, near Bristol; and in America, in several rivers, but especially in the Bay of Fundy, where, at the river Petticodiac, the tide rises 76 feet. It also occurs in Borneo and several rivers in the East.

Attention to the bore in different places is of great importance to the seaman. No boat ventures to navigate the channels between the islands at the mouth of the Brahmapootra at spring-tide; in the Hoogly, the bore running along one bank only, on its approach the smaller shipping is removed to the other side, or ride it out in mid-stream; and in some of the rivers of Brazil the barges, at the spring-tides, are always moored in deep water, it being noticed that the bore is only dangerous on the shoals.

Boreas. Son of Æstræus and Heribeia, generally put for the north wind.

Bore Down. Sailed down from to windward.

Boring. In Arctic seas, the operation of forcing a ship through the loose ice.

Boring-bit. A tool for clearing the vent of a gun.

Borrachio (Sp. *borracho*, drunk). A skin, usually a goat's, for holding wine or water. Used in the Levant. A skin-full; literally, gorged with wine.

Borrow. To approach closely either to land or wind; to hug a shore or coast to avoid an adverse tide.

Bort. The name given to a fishing-line in the Shetland Isles.

Boscawen, Edward, Admiral. Born August 19, 1711. Measuring men by their success, this very distinguished sailor occupies a high place in British annals. For twenty years he was in continual active service. The West Indies, the South American coast, the Mediterranean, India, and the coast of North America were

the scenes of his professional employment. Frequently engaged in contests with the French, he, singularly enough, three times took prisoner the same admiral, and carried more prizes into English ports than any other seaman before or since. Vice-admiral of the blue, 1756. Died January 10, 1761.

Boss. An elevated or thickened portion, usually around an aperture; as, a socket for a pivot-bolt. A master-workman or superintendent.

Boston (Mass.) is on a bay called Boston Harbor, which forms the inner bight of Massachusetts Bay, at the mouth of the Charles and Mystic Rivers. Lat. 42° 21′ 27.6″ N.; lon. 71° 3′ 30″ W. The harbor is excellent, and the wharves, warehouses, and other shipping facilities are not surpassed. Steamers ply hence to Europe and to the principal ports of the United States. Boston has a large trade with the West Indies, and with Nova Scotia and New Brunswick, and the coastwise traffic is extensive. Her commerce with India, China, and Liverpool is very large, although less than it was twenty years ago. Much capital has been expended in the extension of harbor facilities. The inner harbor is completely sheltered, not difficult of access, and is seldom encumbered by ice. Several large works have been constructed for its defense, Forts Warren, Independence, and Winthrop being the most important. The channel is well lighted, the structure on Minot's Ledge being the outermost and highest of its four light-houses. The harbor covers 75 square miles, and has a minimum depth of 23 feet above mean low tide. Charlestown, formerly a suburb of Boston, now incorporated with it, is the seat of a large United States navy-yard. Pop. about 352,000.

Botany Bay. Discovered by Cook in 1770, and received its name from the great variety of herbs found on its shores. The settlement was selected as a site for a colony of English convicts, and the first governor arrived in January, 1788. The colony was eventually located at Port Jackson, 13 miles north of the bay.

Botarga. The roe of the mullet pressed flat and dried; that of commerce, however, is from the tunny, a large fish of passage which is common in the Mediterranean.

Botch. To make bungling work.

Bote's-carle. An old word for coxswain.

Both Sheets Aft. A ship before the wind has both fore-sheets hauled aft. The expression is also applied to a half-drunken sailor rolling along with both hands in his pockets and elbows square.

Botte. An old word for boat.

Bottle-charts. Charts on which the set of surface currents is marked, when the set has been calculated from the data found in bottles thrown overboard and washed up on the beach, or picked up by ships.

Bottle-nose, or Bottle-nosed Whale. A name applied to several of the smaller cetaceans of the northern seas, more especially to the *Hyperoodon rostratus*.

Bottom. The lowest part of anything. The rich low land formed by alluvial deposits. The part of a ship under water; hence, the ship itself; as "foreign bottoms." A *full bottom* denotes that such a form has been given to a ship as to allow her to carry a large amount of merchandise. The bed of a body of water; it is characterized as muddy, rocky, sandy, etc.

BOTTOM-CLEAN. Thoroughly clean, free from weeds, etc.

Bottomry. A contract in the nature of a mortgage of a ship when the owner, or his agent, borrows money to enable him to carry on his voyage, and pledges the keel or *bottom* of the ship (*partem pro toto*) as a security for the repayment. If the ship be lost the lender loses also his whole money; but if it return in safety then he shall receive back his principal, and also the premium stipulated to be paid, however it may exceed the usual or legal rate of interest. And this is allowed to be a valid contract in all trading nations, for the benefit of commerce, and by reason of the extraordinary hazard run by the lender. And in this case the ship and tackle, if brought home, are answerable (as well as the borrower personally) for the money lent. But if the loan be not upon the vessel, but upon the goods and merchandise, which must necessarily be sold or exchanged in the course of the voyage, then only the borrower, personally, is bound to answer the contract, and in this case he is said to take the money at *respondentia* (which see).

BOTTOMRY PREMIUM. The high rate of interest charged on the safety of the ship,—the lender losing his whole money if she be lost.

Bottom-wind. A phenomenon that occurs on the lakes in the north of England, especially Derwent Water, which is often agitated by swelling waves without any apparent cause.

Bouche. See BUSH.

Bougainville, Louis Antoine de. Born in Paris, November 11, 1729. The first voyage round the world by a Frenchman was made by this illustrious seaman. He crossed the Atlantic, braved the stormy seas around Cape Horn, and passed into the Pacific. He visited many places on the western shores of America and among the islands in the Pacific, but the charts which he prepared and bequeathed to his country and posterity are not reliable, owing to the great difficulty in Bougainville's day of making astronomical observations, and the imperfect character of the plans laid down by men of science for ascertaining the longitude. Died August 31, 1811.

Bouge. See BOWGE.

Bouge and Chine, or Bowge and Chime. A method of stowing casks with the bilge of one against the end of another.

Bouguer, Pierre. Born at Le Croisic, in Bretagne, February 16, 1698. A profound French mathematician, who was one of a body of *savants* deputed in 1735 to proceed to South America to measure a degree of the meridian at the equator. Died August 15, 1758.

Bouilli. Preserved beef in hermetically-sealed cans; termed by sailors "bully-beef," or "soup and bully."

Boulder. See BOWLDER.

Boulogne. A town of France, on the English Channel, at the mouth of the Lianne. Lat. 50° 44′ 32″ N.; lon. 1° 36′ 15″ E. The port is formed by piers stretching out only to low-water mark, but the tide rises upwards of 16 feet, and vessels find good anchorage about half a mile from the harbor. There is also a wet-dock with other harbor improvements. Pop. 40,000.

Bounce. The larger dog-fish.

Bouncer. A gun which kicks violently when fired.

Bound. The path of a projectile between two grazes. Destined; going, or intending to go. *Where are you bound?* to what place are you going. *Ice-bound*, entirely surrounded by ice. *Tide-bound*, beneaped, or prevented from sailing by an adverse tide. *Wind-bound*, prevented from sailing by an unfavorable wind.

Boundary-line. The trace of the outer surface of the skin of a ship on the stern-post, stem, and keel.

Bounty for Destruction of Enemies' Vessels. An amount awarded to a ship or vessel of the United States which sinks or destroys a vessel of war belonging to an enemy. If the vessel destroyed was of equal or superior force to the United States vessel, the latter is awarded $200 for each person on board the former at the beginning of the engagement; if of inferior force, $100 for each person. If the captors of an enemy's vessel are instructed to, or do immediately, destroy the vessel for the public interest, $50 is awarded for each person on board the vessel at the time it was captured. The gross amount awarded as above is divided among the officers and crew in the same manner as prize-money. (See PRIZE-MONEY.) When the actual number of persons on board the destroyed vessel cannot be ascertained, it is estimated according to the complement of a vessel of its class in the United States navy. This bounty is authorized by the laws of the United States, but cannot be paid unless an appropriation is made by Congress for that purpose.

Bourdonnais, Bertrand F. de. A naval officer in the service of the French East India Company. He held the post of Director-General of Mauritius (then called the Isle of France) and Bourbon; and in 1746, when France and England were at war, he beat a squadron under Admiral Bassett, and bombarded the city of Madras.

Bourse (*Fr.*). An exchange; a place where merchants congregate to transact business.

Bouse. See BOWSE.

Bout. A turn, round, or trial. A convivial meeting.

'Bout-ship. A contraction of *about-ship*. An order to prepare for going about.

Bow. The forward part of a vessel. A *full* or *bluff* bow is broad and round; a *sharp* or *lean* bow is narrow and thin. The bow *flares* more or less as it falls out or increases in breadth at the upper part. *Doubling of the bows*, a thick planking secured on the bow to prevent the point of the anchor from injuring it. *Bows on*, stem first. *On the bow*, at an angle less than 45° from the ship's course. *Broad off the bow*, at an angle of 45° from the ship's course.

Bow. An old instrument for taking angles, consisting of a graduated arc of 90°, three vanes, and a staff.

Bow-bye. An old expression for the situation of a ship when she is in irons.

Bow-chaser. A gun placed in the bow to fire on a retreating vessel.

Bowd-eaten. An old term for eaten by weevils.

Bowditch, Nathaniel, LL.D., F.R.S., mathematician and astronomer, born in Salem, Mass., March 26, 1773; died at Boston, March 16, 1838. The poverty of his parents occasioned his withdrawal from school at the age of 10, and after an apprenticeship in a ship-chandler's shop until he was 21, he spent nine years in a seafaring life, attaining the rank of master. He published in 1800, while engaged as a supercargo, his well known "Practical Navigator," still a standard work of great utility and value. His fame as a man of science will principally rest on his Commentary on the "Mécanique Céleste" of La Place, of which he made the first entire translation, and which he elucidated in a manner that commands the admiration of scientific men. The elucidations and commentaries of Bowditch form more than half the work. They record subsequent discoveries, and show the sources whence La Place derived assistance. He contributed many valuable papers to "The Memoirs of the American Academy," and an article on modern astronomy to vol. xx. "North American Review." At his death he was a member of the principal scientific societies of Europe. He twice had a seat in the executive council of Massachusetts.

Bowditch's Practical Navigator. The standard work on navigation, published by the government and supplied to all government vessels. It contains, with the "Nautical Almanac," all the data necessary for the solution of problems in navigation.

Bowed. The state of a yard when it arches in the centre from hoisting it too taut. Also of a mast when it bellies or is crippled by injudiciously setting up the rigging too taut.

Bower. See ANCHOR and CHAIN.

Bow-fast. A rope or chain for securing a vessel by the bow. See FAST.

Bowge, or Bouge. An old term for bilge.

Bow-grace. A kind of frame or fender of old junk, placed round the bows and sides of a ship to prevent her receiving injury from floating ice or timbers. See BON-GRACE.

Bowing the Sea. Meeting a turbulent swell in coming to the wind.

Bowlder. A large stone worn and rounded by the attrition of the waves of the sea.

Bowlder-head. A work against the encroachment of the sea made of wooden stakes.

Bowline. A rope leading forward connected by bridles to cringles on the leech of the square-sails; it is used to keep the weather-edge of the sail steady when the ship is close-hauled, and enables the ship to come nearer to the wind.

On a bowline and *on a taut bowline* are expressions to signify that a ship is sailing as close as possible to the wind. *To check*, *slack*, or *come up* a bowline is to let it go when the wind becomes free. *To clear away* a bowline is to let it go when preparing to swing the yard. *To sharp*, *haul taut*, or *steady out* a bowline is to pull it as taut as it can well bear.

BOWLINE-BRIDLE. The span attached to the cringles on the leech of a square-sail to which the bowline is toggled or clinched.

BOWLINE-CRINGLE. An eye worked into the leech-rope of a sail, to which a bowline or the bowline-bridle is attached.

Bowline-bend. The mode of bending warps or hawsers together by making a bowline in the end of one rope, and passing the end of the other through the bight, and making a bowline upon it.

Bowline-knot. A knot much in use on board ship. The loop can be made of any size, and does not jamb nor render.

the scenes of his professional employment. Frequently engaged in contests with the French, he, singularly enough, three times took prisoner the same admiral, and carried more prizes into English ports than any other seaman before or since. Vice-admiral of the blue, 1756. Died January 10, 1761.

Boss. An elevated or thickened portion, usually around an aperture; as, a socket for a pivot-bolt. A master-workman or superintendent.

Boston (Mass.) is on a bay called Boston Harbor, which forms the inner bight of Massachusetts Bay, at the mouth of the Charles and Mystic Rivers. Lat. 42° 21′ 27.6″ N.; lon. 71° 3′ 30″ W. The harbor is excellent, and the wharves, warehouses, and other shipping facilities are not surpassed. Steamers ply hence to Europe and to the principal ports of the United States. Boston has a large trade with the West Indies, and with Nova Scotia and New Brunswick, and the coastwise traffic is extensive. This bounty is authorized by the laws of the United States, but cannot be paid unless an appropriation is made by Congress for that purpose.

Bourdonnais, Bertrand F. de. A naval officer in the service of the French East India Company. He held the post of Director-General of Mauritius (then called the Isle of France) and Bourbon; and in 1746, when France and England were at war, he beat a squadron under Admiral Bassett, and bombarded the city of Madras.

Bourse (*Fr.*). An exchange; a place where merchants congregate to transact business.

Bouse. See BOWSE.

Bout. A turn, round, or trial. A convivial meeting.

'Bout-ship. A contraction of *about-ship*. An order to prepare for going about.

Bow. The forward part of a vessel. A *full* or *bluff* bow is broad and round; a *sharp* or *lean* bow is narrow and thin. The bow *flares* more or less as it falls out or increases in breadth at the upper part. *Doubling of the bows*, a thick planking secured on the bow to prevent the point of the anchor from injuring it. *Bows on*, stem first. *On the bow*, at an angle less than 45° from the ship's course. *Broad off the bow*, at an angle of 45° from the ship's course.

Bow. An old instrument for taking angles, consisting of a graduated arc of 90°, three vanes, and a staff.

Bow-bye. An old expression for the situation of a ship when she is in irons.

Bow-chaser. A gun placed in the bow to fire on a retreating vessel.

Bowd-eaten. An old term for eaten by weevils.

Bowditch, Nathaniel, LL.D., F.R.S., mathematician and astronomer, born in Salem, Mass., March 26, 1773; died at Boston, March 16, 1838. The poverty of his parents occasioned his withdrawal from school at the age of 10, and after an apprenticeship in a ship-chandler's shop until he was 21, he spent nine years in a seafaring life, attaining the rank of master. He published in 1800, while engaged as a supercargo, his well known "Practical Navigator," still a standard work of great utility and value. His fame as a man of science will principally rest on his Commentary on the "Mécanique Céleste" of La Place, of which he made the first entire translation, and which he elucidated in a manner that commands the admiration of scientific men. The elucidations and commentaries of Bowditch form more than half the work. They record subsequent discoveries, and show the sources whence La Place derived assistance. He contributed many valuable papers to "The Memoirs of the American Academy," and an article on modern astronomy to vol. xx. "North American Review." At his death he was a member of the principal scientific societies of Europe. He twice had a seat in the executive council of Massachusetts.

Bowditch's Practical Navigator. The standard work on navigation, published by the government and supplied to all government vessels. It contains, with the "Nautical Almanac," all the data necessary for the solution of problems in navigation.

Bowed. The state of a yard when it arches in the centre from hoisting it too taut. Also of a mast when it bellies or is crippled by injudiciously setting up the rigging too taut.

Bower. See ANCHOR and CHAIN.

Bow-fast. A rope or chain for securing a vessel by the bow. See FAST.

Bowge, or Bouge. An old term for bilge.

Bow-grace. A kind of frame or fender of old junk, placed round the bows and sides of a ship to prevent her receiving injury from floating ice or timbers. See BON-GRACE.

Bowing the Sea. Meeting a turbulent swell in coming to the wind.

Bowlder. A large stone worn and rounded by the attrition of the waves of the sea.

Bowlder-head. A work against the encroachment of the sea made of wooden stakes.

Bowline. A rope leading forward connected by bridles to cringles on the leech of the square-sails; it is used to keep the weather-edge of the sail steady when the ship is close-hauled, and enables the ship to come nearer to the wind.

On a bowline and *on a taut bowline* are expressions to signify that a ship is sailing as close as possible to the wind. *To check*, *slack*, or *come up* a bowline is to let it go when the wind becomes free. *To clear away* a bowline is to let it go when preparing to swing the yard. *To sharp*, *haul taut*, or *steady out* a bowline is to pull it as taut as it can well bear.

BOWLINE-BRIDLE. The span attached to the cringles on the leech of a square-sail to which the bowline is toggled or clinched.

BOWLINE-CRINGLE. An eye worked into the leech-rope of a sail, to which a bowline or the bowline-bridle is attached.

Bowline-bend. The mode of bending warps or hawsers together by making a bowline in the end of one rope, and passing the end of the other through the bight, and making a bowline upon it.

Bowline-knot. A knot much in use on board ship. The loop can be made of any size, and does not jamb nor render.

Bow-lines. Longitudinal curves representing the ship's fore-body.

Bowling Along. Sailing rapidly with a free wind.

Bowman, or Bow-oarsman. The man who pulls the forward oar in a single-banked boat. In a double-banked boat there are two bowmen.

Bow-oar. The foremost oar or oars in a pulling boat.

Bow-rail. The rail around the bows.

Bowse. To haul heavily upon a rope or tackle. *Bowse up the jib*, a colloquialism to denote the act of tippling. It is an old term, probably derived from the Dutch *buyzen*, to booze.

Bowsprit. A large spar projecting over the bows to support the foremast and extend the head-sails. It is supported laterally by shrouds, and from below by the gammoning and bobstays. The outer end is the *head*, the inner end the *heel*, and that portion which is inboard is called the *housing*. A *running-in* bowsprit is used in boats, and when the jib is hauled down, the bowsprit is run in.

Bowsprit-bitts. Strong upright timbers secured to the beams below the deck; they have a cross-piece bolted to them, the inner end of the bowsprit steps between them, and is thus prevented from slipping in. The cross-piece prevents it from canting up.

Bowsprit-cap. The cap on the outer end of the bowsprit, through which the jib-boom traverses.

Bowsprit-chock. A piece placed between the knight-heads, fitting close upon the upper part of the bowsprit.

Bowsprit-gear. A term denoting the ropes, blocks, etc., belonging to the bowsprit.

Bowsprit-heart. The heart or block of wood used to secure the lower end of the fore-stay, through which the inner end of the jib-boom is inserted. It is seldom, if ever, used now.

Bowsprit-horses. The ridge-ropes which extend from the bowsprit-cap to the knight-heads.

Bowsprit-netting. The netting placed just above a vessel's bowsprit, for stowing the fore-topmast staysail; it is usually lashed between the ridge-ropes.

Bowsprit-shrouds. Strong ropes or chains leading from nearly the outer end of the bowsprit to the bow, giving lateral support to that spar.

Bow-timbers. The timbers which form the bow of a ship.

Box. See Cartridge-, Coxswain-, Passing-, Primer-, Transporting-, and Shell-box.

Boxhauling. An evolution by which a ship is veered short round on her heel, when the object is to avoid making a great sweep. Luff; when headway has ceased, haul up mainsail, brail up spanker, square after-yards, brace abox head-yards. Keep the after-sails lifting till braced up sharp on the other tack, and lay the head-yards square. Shift the helm when the ship gathers headway, and set the mainsail and spanker when they will take on the other tack. With much wind and sea this evolution would be dangerous, and it is seldom performed except in a case of emergency, as a seaman never likes to see his ship have sternway.

Boxing. Any projecting wood forming a rabbet; as, the boxing of the knight-heads.

Box-metal. A composition of 32 parts of copper to 5 of tin.

Box-off. To force the ship's head off from the wind by hauling aft the head-sheets and bracing aback the head-yards.

Box the Compass. To repeat the names of the points of the compass in regular order.

Boy. A rating in the navy. See Naval Apprentice System.

Boyart. An old term for a hoy.

Boyer. A sloop of Flemish construction, with a raised work at each end.

Brab. The sheaf of the young leaves of the Palmyra palm, from which sennit for hats is made.

Brab-tree. The Palmyra palm.

Brace. A composition strap to receive a pintle of the rudder; a gudgeon. A prop or support. In carpentry and engineering the term strictly applies to something that supports parts in compression, being the opposite of a *stay* or *tie;* but in boiler-making it is sometimes applied to parts in tension.

One of the ropes attached to the extremities of the yards by which they are moved about horizontally. They also assist in counteracting the lateral strain brought on the yard by the wind acting on the sail. *To brace* a yard, to move it horizontally by the braces. *To brace up*, to haul in the lee braces. To brace up *sharp*, to brace a yard as far forward as the stay and rigging will permit it to go. *To brace in*, to haul in the weather braces. *To brace to*, to check the lee head-braces and haul in the weather ones to allow the ship's head to come up to the wind rapidly. *To brace aback*, to so brace a yard that its sail will be aback. *To brace abox*, to lay the head-yards abox. *To counter-brace* the yards is to brace them all sharp up, the head-yards by opposite braces to the after-yards.

Brace of Shakes. An expression signifying "in a moment"; as, I will be with you in a *brace of shakes*. The expression is taken from the flapping of a sail.

Brace Pendant. A length of rope or chain into which the yard-arm brace-blocks are spliced. They are in use in the merchant service, and have the following advantages, viz., rope is saved, the blocks have more play, and when the lee brace is let go the weight of the chain overhauls the brace.

Brace Up! Gather Aft! An order to brace up the head-yards and haul aft the head-sheets which had been flowing.

Bracket. A short crooked timber resembling a knee, used as a support. One of the vertical side pieces of a gun-carriage; when made of wood they are generally formed of two pieces jogged and doweled together.

Brackish. Moderately salty; applied to river water mingled with sea water.

Brad. A small nail without a head, having a projection at the top on one side.

Brad-awl. A tool to pierce holes for the insertion of brads.

Brail. Brails are ropes, the bights of which are seized to the leech of a trysail, leading through blocks on the gaff or luff. All trysails are fitted with them. They serve to gather up the sail ready for the furling-line. When a jib is fitted with brails it is for the purpose of lifting the clew clear of the stays when the sheet is

shifted over. *Foot-brails*, the lowest brails. *Peak-brails*, the outermost brails on the gaff. *Throat-brails*, the brails which make fast to the clew of the sail and reeve through a block at the jaws of the gaff. *Brail-up!* the order to pull on the brails and thereby spill the sail and haul it up for furling.

Brake. The lever which works a pump. A piece of mechanism for retarding or stopping machinery by friction.

Bran. To go on. To lie under a floe edge, in foggy weather, in a boat in Arctic seas, to watch the approach of whales.

Branch (*Eng.*). The diploma of those pilots who have passed at the Trinity House, as competent to navigate vessels in particular places.

Branch-pilot (*Eng.*). One approved by the Trinity House, and holding a branch, for a particular navigation.

Brand. The Anglo-Saxon for a burnished sword. A burned device or character.

Branded Ticket (*Eng.*). A discharge given to an infamous man, on which his character is written, and the reason he is turned out of the service. In the army, deserters are branded with D; also B for bad character. In the navy, a corner of the ticket is cut off.

Brandling. A supposed fry of the salmon species, found on the north of England coasts. Also, the angler's dew-worm.

Bran-new. Brand-new; quite new.

Brash. Small fragments of crushed ice, collected by the wind or sea near the shore, which a ship can force her way through.

Brass. Impudent assurance. An alloy of copper and zinc. The proportions vary according to the required color and proposed use. The term is often employed as synonymous with bronze (which see), as when it is applied to ordnance, the bearings of machinery, etc. See BRIGHT-WORK, SHEATHING.

Brave. This word is used to express strength as well as courage; as, a brave wind.

Brawet. A kind of eel.

Brazil, Navy of. Fifty-seven steamers, of which 18 are ironclads, carrying 68 guns, and possessing 5060 horse-power, represent the navy of the Brazilian empire. The gunboats are 23 in number. The rest of the vessels are corvettes and transports, and 1 small frigate. The crews consist altogether of 4200 sailors, and for their command and the general management of naval affairs there is a minister of marine, 1 admiral, 2 vice-admirals, 4 rear-admirals, 8 chiefs of division, 16 post-captains, 30 captains of frigates, 60 commanders, 146 lieutenants, and 88 sub-lieutenants. There are 5 naval arsenals and [illegible] good naval school.

Breach. An old term for a [illegible]vy surf. An old word to denote the gap i[illegible] levee or bank made by the breaking in of [illegible] sea, now also applied to the opening or gap [illegible]ortified works, made by an enemy's guns. [illegible]olling of waves over a vessel; a *clear* brea[illegible]plies that the waves roll over without [illegible]ng, and a sea makes a *clean* breach when [illegible]asts and every object on deck are swept a[illegible]

Breaching. A word m[illegible] the act of leaping out of the water; app[illegible] whales.

Breachy. Brackish, a[illegible]ed to water, probably derived from the fa[illegible]t water was made brackish by the sea break[illegible]

Bread. The usual name given to biscuit for ship's use.

Bread-fruit. The fruit of a tree (*Artocarpus incisa*) found in the islands of the Pacific. When baked it somewhat resembles bread. The name is also applied to the tree.

Bread-room. A water-tight compartment in which the bread is stowed.

Bread-room Jack. See JACK O' THE DUST.

Bread-tree. See BREAD-FRUIT.

Break. An opening in the clouds. An interruption; as, a break in an electric circuit. A sudden ending; as, the break of the poop. To deprive of commission, warrant, or rating. To shatter into pieces; as, a wave breaks. *To break one's liberty or leave* is to remain away beyond the time specified for returning. *To break off*, to be forced off to leeward of the course by a change in the direction of the wind. *Break off!* An order to stop working at one job to begin at another. *To break up*, to separate into parts; as, the ice breaks up. *To break up a ship* is to take her to pieces when she becomes old and unserviceable. *Breaking up* of the monsoon, the ending or shifting of a monsoon. This period is generally prolific of violent storms. *Breaking of a gale*, indications of a return of fair weather. *To break bulk*, to destroy the entirety of a cargo by removing a portion of it. *To break ground*, to heave the anchor clear of the ground. *To break joints*, to so arrange the planking that the joints in adjoining courses do not coincide with each other. When a ship at anchor is forced by the wind or current out of her proper position she is said to *break her sheer*.

Breakage. Damage to goods in being broken. The leaving of empty spaces in stowing the hold.

Break-beam. A beam at the break of a deck.

Breaker. A small water-cask. A wave which breaks violently over reefs or rocks lying at, or under, the surface of the water. They are distinguished both by their appearance and by their sound, as they cover the sea with foam and produce a loud roaring. *Breakers ahead!* A warning from the lookout that there is broken water in the direction the ship is standing.

Breakwater. Any structure or contrivance, as a mole, mound, wall, or sunken hulk, to break the force of waves and protect a harbor or anything which is exposed to the force of the waves.

Bream. A common fresh- as well as salt-water fish (*Abramis brama*), little esteemed as food.

Breaming. Cleaning a ship's bottom by burning off the grass, ooze, shells, or sea-weed, which it has contracted by lying long in harbor; it is performed by holding kindled furze, fagots, or reeds to the bottom, which, by melting the pitch that formerly covered it, loosens whatever filth may have adhered to the planks; the bottom is then covered anew with a composition of sulphur, tallow, etc., which not only makes it smooth and slippery, so as to divide the fluid more readily, but also poisons and destroys those worms which eat through the planks in the course of a voyage. This operation may be performed either by laying the ship aground after the tide has ebbed from her, or by docking or careening.

Breast. To run abeam of a cape or object. To cut through a sea, the surface of which is poetically termed breast. *To breast the sea*, to meet it by the bow on a wind. *To breast the*

surf, to brave it, and overcome it by swimming. *To breast a bar*, to heave at the capstan. *To breast to*, the act of giving a sheer to a boat.

Breast-backstay. Breast-backstays extend from the head of an upper mast, through an outrigger, down to the channels forward of the standing backstays, for supporting the upper spars from to windward. When to leeward, they are borne abaft the top-rim.

Breast-fast. A rope or chain used to confine the midship part of a ship to a wharf or another ship, as the bow-fast confines her forward, and the stern-fast abaft. See FAST.

Breast-gaskets. An old term for bunt-gaskets.

Breast-hooks. Large pieces of compass-timbers or knees fitted in the bows of ships against the apron and stemson, with the arms running back across the timbers of the bow. Those in the line of the decks are called deck-hooks.

Breast-rail. The upper rail of the balcony; formerly it was applied to a railing in front of the quarter-deck, and at the after-part of the forecastle-deck.

Breast-rope, or Breast-band. A rope or band fitted between the shrouds in the chains for the safety of the leadsman.

Breather. A tropical squall.

Breath of Wind. The lightest perceptible air.

Breech. The outer angle of a knee-timber. The end of a block farthest from the hook. The portion of a gun abaft the chamber.

BREECH-BLOCK. A mass of metal which closes the breech of a gun, and receives the rear thrust of the charge when it is fired.

BREECHING. A large rope rove through the cascabel of a gun and secured to the ship's side, to limit the recoil. Breechings are made of hemp, and they are not to be covered, blackened, nor rendered less pliable in any way.

BREECHING-BOLT. A bolt in the ship's side to which the breeching is shackled.

BREECH-LOADER. A gun, large or small, which is charged at the breech. The objects sought to be attained by this change from the old system are rapidity in loading, facility of cleaning, accurate adjustment of the size of the shot to the calibre of the gun, and facility in making the shot accommodate itself to the rifling. Additional mechanism is required, as the breech must be so far opened as to admit the shot and cartridge, and then so firmly closed as to resist the immense pressure occasioned by the discharge of the piece. See ORDNANCE and SMALL-ARMS.

BREECH-PIN. A plug screwed into the rear-end of a gun-barrel, forming the bottom of the bore. Called also a breech-screw or breech-plug.

BREECH-PLUG. See BREECH-PIN.

BREECH-SCREW. See BREECH-PIN.

BREECH-SIGHT. See SIGHT.

Breese, Samuel L., Rear-Admiral U.S.N. Born in New York. Appointed at large, September 10, 1810. Midshipman Breese was present at the battle of Lake Champlain. Commissioned as lieutenant, April 27, 1816, and as commander, December 22, 1835. Commissioned as captain, September 8, 1841.

Captain Breese was in the Pacific during the Mexican war, and was present at the attack on, and capture of, the towns Tuspan and Tobasco, Mexico, and at the capture of Vera Cruz, 1847; special duty on the lakes, 1848; commandant Norfolk navy-yard, 1853–55; commanding Mediterranean Squadron, 1856–58; commandant navy-yard, New York, 1859–61.

Commissioned as rear-admiral, July 16, 1862; light-house inspector, 1862; special duty, New York, 1865; port admiral at Philadelphia, 1867–68. Died in Philadelphia, 1870.

Breeze. A wind which may be characterized as light, gentle, moderate, fresh, stiff, or strong. The *land* and *sea* breezes are occasioned by the unequal heating of the land and water. On the coast within the tropics, a light breeze sets in from the sea in the morning, and gradually increases in strength until the hottest portion of the day, when it begins to decrease, and sinks to a calm toward sunset. Soon after the land-breeze commences to blow, and continues until the morning, when it gives place, in turn, to the sea-breeze.

During the day the land becomes more heated than the sea, and the air over the land ascends, and the cold air from the sea rushes in to supply its place. After sunset the land parts with its heat more readily than the water, and the temperature falls below that of the sea, and the air becoming heavier and denser, flows out to sea as a land-breeze.

TO KICK UP A BREEZE. To create a disturbance. When the wind increases it is said to *breeze up*.

Brest. A city of France, on the N. shore of a small gulf, called the Road of Brest. Lat. (of observatory) 48° 23′ 32″ N.; lon. 4° 29′ 25″ W. It is a fortified city of the first class. From its natural advantages, the extent of its various establishments, and its means of defense, Brest is one of the first naval ports in Europe. The outer road is one of the finest in the world, and has no superior in the safety and excellence of its anchorage. It communicates with the sea by a single passage, called the Goulet, 1750 yards broad. In the middle of the passage rise the Mingan Rocks, which contract the entrance, and oblige vessels to pass directly under the batteries. It has extensive quays, large basins, vast magazines, ship-yards, etc. Brest has important educational establishments, and the naval school is here located. The port has little trade, and its manufacturing establishments outside the arsenals are not large. A telegraph cable extends to Duxbury, Mass. Pop. 70,000.

Brewing. Gathering or forming; as, a storm which is foretold by the gathering of clouds, or other indications.

Bricklayer's Clerk. A contemptuous expression for one who pretends to have seen "better days," but who is forced to betake himself to seafaring.

Bridge. A [illegible] arrangement of electrical circuits used for [illegible] the resistance of a substance in the cir[illegible]

A plati[illegible] or other substance, in a circuit, whi[illegible] A [illegible]eat resistance to the passage of the cu[illegible] [illegible]eason of this resistance heat is evolve[illegible] the current be sufficient, ignites th[illegible]

Bridge. [illegible] ridge of rock, sand, or shingle, a[illegible]tom of a channel, so as to occasion a[illegible] which the tide ripples.

Bridge. [illegible] partition in a furnace. It may be [illegible] brick or of iron. Some-

times it is hollow, and forms a portion of the water-space of a boiler.

Bridge. A platform extending across the deck above the rail for the convenience of the officer in charge of the ship. Some vessels have two bridges, one forward of the main- and the other forward of the mizzen-mast. In paddle-wheel vessels it connects the paddle-boxes.

Bridgeport, a city and port of entry of Connecticut, is on a small inlet of Long Island Sound, at the mouth of the Pequonnock River. Steamers ply daily between this port and New York. Pop. 20,000.

Bridle. A chain or rope span, both ends of which are made fast, the power being applied to the bight or middle portion.

BOWLINE-BRIDLE. A span the legs of which are attached to the leech of a sail, and the bowline is bent to the bight.

BRIDLE-CABLE. The cable which is bent to a bridle.

MOORING-BRIDLE. The chains of permanent moorings.

Bridle-port. The forward port on the gun-deck.

Brig. The name given to the place where prisoners are confined on board men-of-war. A two-masted square-rigged vessel. See BRIG-SCHOONER and HERMAPHRODITE BRIG.

Brigantine. A two-masted square-rigged vessel, differing from a brig in that she does not carry a square mainsail.

Bright Look-out. A vigilant look-out.

Bright-work. A term applied to metal objects which are kept bright by polishing; as, the railing about the hatches, capstan-head, cap-squares, lock- and sight-covers, metal blocks, rear face of the cascabel, face of the muzzle, ring-bolts in the decks, etc. *Bright wood-work* is a term applied to the wood-work which is scraped and scrubbed; as, the pin-rails, cavils, cleats, halliard-racks, etc.

Brig-schooner. A two-masted vessel with square-sails on the foremast and fore-and-aft sails on the main; an hermaphrodite brig.

Brill. The *Pleuronectes rhombus*, a common fish, allied to, but smaller than, the turbot.

Brine. A saturated solution of salt.

Brine-gauge. See SALINOMETER.

Brine-pump. A pump to draw off the super-salted water from a boiler.

Brine-valve. A blow-off valve.

Bring by the Lee. See BROUGHT BY THE LEE.

Bring 'em Near. A spy-glass.

Bringers Up. The men who are last in a boarding party. The rear-most men.

Bring Home. When the toggle becomes disengaged and the chip slips through the water the ship *brings home the log*. When in heaving up the anchor, the anchor *comes home*, the ship *brings home the anchor*.

Bringing-to Bolt. A bolt having an eye in one end and a nut and screw at the other; used in keying up a structure.

Bring the Sun Down. To bring in contact the horizon and the reflected image of the sun in a sextant or other instrument.

Bring-to. *To bring-to* a sail is to bend it to its yard or gaff. *To bring to* a messenger or cable is to put it around the capstan. *To bring a ship to* is to lie-to or heave-to or force another ship so to do. *To bring a ship to an anchor* is to let go the anchor. *To bring an enemy to action* is to force him to give battle.

Bring-up. To stop. A ship is *brought up* when her way is stopped either by letting go the anchor, or by running on a rock or shoal. *To bring-up with a round turn* is to stop the running of a rope by taking a round turn around a cavil or pin; figuratively used in speaking of doing anything effectually though abruptly. *To bring-up all standing* is to be stopped suddenly and without warning.

Briny. An adjective which, used as a noun, signifies the sea; as, plowing the *briny*.

Brisas. A northeast wind which blows on the coast of South America during the trades.

Brismak. A name among the Shetlanders for the excellent fish called tusk or torsk, the best of the cod kind (*Brosmus vulgaris*).

Bristol (England) is on the Avon, at its confluence with the Frome, 8 miles from Bristol Channel. It is one of the leading British ports in foreign trade. Large ships can ascend the river to the city, where spacious docks, quays, and ship-yards have been constructed. It is the fourth town in Great Britain in customs revenue. Pop. 190,000.

Brit. A fish of the herring kind (*Clupea minima*) from 1 to 4 inches long, found, at some seasons, in immense numbers, on the eastern coast of New England.

British-built Ship. A ship built in Great Britain or Ireland, Guernsey, Jersey, the Isle of Man, or some of the colonies, plantations, islands, or territories in Asia, Africa, or America, which, at the time of building, belonged to or were in possession of Great Britain; or any ship whatsoever which has been taken and condemned as lawful prize. See INTERNATIONAL LAW.

British Seas. The four seas which surround Great Britain.

Brittle-star. The common name of a long-rayed starfish (*Ophiocoma rosula*).

Broach. To pierce; to tap; as a cask, to draw off the fluid. *To broach a business*, to begin it.

Broach-to. To fly up into the wind. It generally happens when there is considerable sea on, and the ship is carrying a press of canvas with a good deal of after-sail set. When a ship sails with the wind aft, or on the quarter, the wind acts in the direction of the ship's course and the pressure on the sails is very much diminished. If from this position the ship suddenly presents her broadside to the wind, the sails, masts, and rudder will be endangered, and in extreme cases the ship may capsize or be forced down stern foremost. Broaching-to is generally occasioned by the difficulty of steering the ship; by the negligence or incapacity of the helmsman; or by an accident happening to the helm which renders it incapable of governing the ship. See BROUGHT BY THE LEE.

Broad Arrow (*Eng.*). The royal mark for government stores.

Broad-ax. See AX.

Broadcloth. Square-sails. A wide and superior article of woolen cloth, plain or twilled.

Broad-horn. An old name for a flat-boat on the Western rivers.

Broad of Water. An extensive lake with a channel communicating with the sea, or a wide opening of a river after passing a narrow entrance.

commerce of Buffalo is large and constantly increasing, a fact due to its location at the foot of the great chain of lakes, and to its being the terminus of the Erie Canal and of several railroad lines. Grain is the most important article of commerce, and the facilities for handling and storing it are unexcelled by those of any other city on the continent. Pop. 150,000.

Bug. An old term for a vessel more remarkable for size than efficiency.

Bugalilo. A large trading-boat of the Gulf of Persia; called *buglo* by sailors.

Bugazeen. An old term for calico.

Buggy-boat. A boat fitted with wheels for use as a vehicle on land.

Bugling. At the Naval Academy the bugle sounds a call to terminate each recitation, and when a midshipman has a problem which he is unable to solve, he sometimes remains at the blackboard until this call is sounded, trusting thus to evade the consequences of a poor recitation. This manœuvre is termed *bugling*.

Bugologist. Jack's term for an amateur entomologist.

Build. A vessel's form or construction.

Build a Chapel. To turn a vessel suddenly by negligent steering. See CHAPEL.

Builder's Certificate. A document containing an account of a ship's denomination, tonnage, where and by whom built, etc.

Built. A suffix to denote the construction of a boat or vessel; as, carvel-built, frigate-built, sharp-built, etc.

Built-block. A made block.

Built-up. An expression applied to masts or guns made of several pieces.

Bulch. To bilge.

Bulge. See BILGE.

Bulk. The greater part. Substances stowed without cases or packages are stowed *in bulk. To break bulk*, to commence discharging cargo.

BULKER. A person employed to measure goods, and ascertain the amount of freight with which they are chargeable.

Bulk-head. Any partition separating apartments on the same deck. Some are very strong, and others are light and can be removed at pleasure. *To bulk-head* is to carry on a conversation which is intended for the ears of a third party.

Bull. A male whale. Weak grog made by pouring water into a spirit-cask nearly empty. When the tide and wind cause the ship to bump up against her buoy she is said to *bull the buoy*.

Bull-dance. A stag-dance.

Bull-dogs. A general term for the main-deck guns.

Bullet. A small projectile, usually of lead, and either spherical or elongated, for use in the smaller kinds of fire-arms, such as muskets, rifles, carbines, and pistols. Formerly spherical bullets were made by melting lead and pouring it into molds. They are now made more expeditiously and more truly spherical by compression. The lead is first formed into a rod about a yard long by five- or six-eighths of an inch thick, which is passed between rollers for the purpose of condensing it; other rollers then press it into a row of nearly globular pieces, to each of which the proper form is given by means of a spherical die, after which a treadle-worked punch separates them into bullets. The spherical bullet is, however, rapidly becoming obsolete, having been almost entirely superseded by the elongated bullet, which encounters less resistance from the air, and has a longer range and greater penetrating power than the spherical. Several forms of the elongated bullet are used. In most of them the base of the bullet is made expansive either by being hollowed, or by being fitted with a wooden plug, so that the force of the powder shall dilate the lead and cause it to fill the grooves of the rifle. By this means the bullet acquires a rotatory motion around its long axis which tends to increase its range and precision. See EXPLOSIVE BULLET.

BULLET-COMPASSES. A pair of compasses with a ball on one leg to fit in a hole.

BULLET-LADLE. A ladle for melting lead for casting bullets.

BULLET-MOLD. An implement for shaping bullets.

BULLET-PROBE. An instrument for exploring tissue to find the situation of a bullet.

BULLET-SCREW. A screw on the end of a rammer for drawing a bullet from a fire-arm.

BULLET-SHELL. An explosive bullet.

Bull-head, or Bull-jub. A name of the fish called miller's thumb (*Cottus gobio*).

Bullion. Heavy twisted fringe for ornaments.

Bullock-block. A block formerly used under the topmast cross-trees for the topsail-ties.

Bullock-slings. Slings for hoisting in live cattle.

Bull's-eye. A small annular block of hard wood without a sheave; it has a groove to take a strap, and is measured by its diameter. A small circular cloud ruddy in the centre, a forerunner of a storm. The centre of a target. The lens of a dark lantern; hence the lantern itself. A small, thick, circular piece of glass inserted in the decks, port-lids, etc., for the admission of light. A popular name for the star Aldebaran (*a Tauri*).

BULL'S-EYE CRINGLE. A cringle worked around a bull's-eye.

Bull-trout. The salmon-trout of the Tweed. A large species of trout taken in the waters of Northumberland. The sea-trout.

Bullyrag. To reproach contemptuously, and in a hectoring manner; to bluster, to abuse, and to insult noisily.

Bulwark. The planking or wood-work round a vessel above the deck.

BULWARK-NETTING. An ornamental frame of netting answering the purpose of a bulwark.

Bumbard. A cask or large vessel for liquids. See BOMBARD.

Bum-boat. A boat employed to carry provisions, vegetables, and small merchandise for sale to ships. The name is corrupted from *bombard*, the vessel in which beer was formerly carried to soldiers on duty.

Bumkin, Bumpkin, or Boomkin. A short boom or beam of timber projecting from each bow of a ship. Its use is to extend the weather clew of the foresail. The name is also applied to the timber projecting from each quarter for the main-brace blocks.

Bummaree. A word synonymous with *bottomry* in maritime law. It is also a name given to a class of speculating salesmen of fish, not recognized as regular tradesmen.

Bump. To bump a boat is to pull astern of her in another, and insultingly or inimically give her the stem.

Bump-ashore. To run stem-on to a beach or bank. A ship bumps by the action of the waves lifting and dropping her on the bottom when she is aground.

Bumper. A log of wood over the side, used as a fender.

Bumpkin. See BUMKIN.

Bund. In the East, an embankment or sea-wall.

Bundle. To load things into a boat in a slovenly manner. *Bundle up!* Hurry up from below.

Bungle. To perform duty in a slovenly manner.

Bungo, or Bonga. A dug-out made from the bonga-tree.

Bung-starter. A stave or bat used for starting bungs by beating on the cask on either side of the bung. A sobriquet for the captain of the hold.

Bung-up and Bilge-free. A cask placed with the bung-stave uppermost, and the bilge clear of everything.

Bunk. A standing bed-place.

Bunker. A bin for stowing coal on board a steamer.

Bunt. The middle part of a sail. The sail which is tossed up on the centre of the yard in furling. A *high* bunt is formed when the bunt-whip is hauled taut-up and a great amount of sail is stowed in the exact centre of the yard; in a *low* or *rolling* bunt the sail tapers gradually from the centre.

BUNTERS. The men who stow the bunt.

BUNT-FAIR. Before the wind.

BUNT-GASKET. See GASKET.

BUNT-JIGGER. A small purchase for rousing up the bunt of heavy sails.

BUNT-WHIP. A whip for rousing up the bunts of the light sails in furling.

Bunting. A thin woolen stuff of which flags are made.

Buntline. One of sev[...]l ropes toggled to the foot of a sail and leadin[...] thence, before all, to blocks above the yard and thence to the deck. They are used for hauling the foot of the sail up to the centre of the yard.

BUNTLINE-CLOTH. A narrow lining on the forward surface of a sail in the wake of the buntline to protect the [...]il from chafe.

BUNTLINE-CRI[...]LE. A cringle worked into the foot-rope of [...]il to which the buntline was clinched. Crin[...] have been superseded by toggles.

BUNTLINE-S[...] A short piece of rope with a thimble in o[...] through which the buntline is rove; the [...]nd is made fast to the tie-block to keep [...] into the yard. It is generally called a [...]

BUNTLIN[...] A toggle seized to the foot-rope of [...] which the buntline is attached by a [...] When the sail is loosed to a bowline, th[...] are unbent from the bridles and are att[...]ese toggles.

Buoy. [...] body, commonly a water-tight cask, [...]lock of wood. They are attached t[...]n by a rope or chain, and serve to m[...]annel, or indicate the position of obj[...]e surface of the water; as, rocks, sho[...] etc. They are also used for other [...], life-preservers, floats for permanen[...] floats for the upper edge of a sein[...] are generally made of wood, or sheet-iron, but gutta-percha has sometimes been used. They are variously shaped and colored, and sometimes named and numbered, in order that they may be easily distinguished from each other. A *cone-* or *can-buoy* is conical in shape, a *cask-buoy* cylindrical or nearly so, and a *nut-* or *nun-buoy* is shaped like the frustrum of two cones with the bases joined together. A *spar-buoy* is a spar, one end of which is anchored. *Anchor-buoys* are attached to the anchors, and serve to mark out the position of the anchors, so that they may be avoided in tending ship, or picked up in case of being obliged to slip. A *bell-buoy* is a large buoy on which is placed a bell, which is sounded by the heaving and setting of the sea. A *whistling-buoy* is fitted with an apparatus which makes a peculiar whistling noise at certain stages of the tide or sea. *To buoy* an object is to indicate its position by means of a buoy and a rope or chain. *To buoy* the cable is to attach a buoy to the bight to keep it from sinking and chafing against the rocks. *To bleed a buoy* is to let the water out of it. A buoy *watches* when it floats on the water. *To stream the buoy* is to let an anchor-buoy fall from the bows previous to letting go the anchor.

Buoyancy. The quality of floating in a liquid. The weight of a floating body as measured by the volume of fluid displaced.

CENTRE OF BUOYANCY. See CENTRE.

Buoys, Directions for Coloring, Numbering, and Placing. UNITED STATES.—In conformity to the terms of the act of Congress, approved September 28, 1850, prescribing the manner of coloring and numbering the buoys along the coasts and in the bays, sounds, rivers, and harbors of the United States, the following order must be observed, viz.:

1. In approaching the channel, etc., from seaward, *red buoys*, with *even numbers*, will be found on the *starboard* side of the channel, and must be left on the *starboard* hand in passing in.

2. In approaching the channel, etc., from seaward, *black buoys*, with *odd numbers*, will be found on the *port* side of the channel, and must be left on the *port* hand in passing in.

3. *Buoys* painted with *red* and *black horizontal stripes* will be found on *obstructions*, with channel-ways on either side of them, and may be left on either hand in passing in.

4. *Buoys* painted with *white* and *black perpendicular stripes* will be found in *mid-channel*, and must be passed close-to to avoid danger.

5. All other distinguishing marks to buoys will be in addition to the foregoing, and may be employed to mark particular spots, *a description of which will be given in the printed list of buoys.*

6. Perches, with balls, cages, etc., will, when placed on buoys, be at turning-points, the color and number indicating on what side they shall be passed.

The following abbrevations are used on charts and buoy lists:

R., red buoys, Nos. 2, 4, 6, etc., starboard. B., black buoys, Nos. 1, 3, 5, etc., port. P. S., white and black perpendicular stripes, without numbers, in mid-channel. H. S., red and black horizontal stripes (on obstructions), without numbers.

BELGIUM.—On entering the channel from sea-

ward, *white* buoys must be left on the starboard hand, *black* buoys on the port.

CANADA.—The same as the United States.

ENGLAND.—The starboard side of a channel is the right-hand side proceeding from seaward. The entrance to a channel or a turning-point is marked by a spiral buoy, with or without staff and globe, triangle, cage, etc. Single-colored can-buoys, *black* or *red*, mark the starboard side, and buoys of the same shape and color, either checkered or vertically striped with *white*, mark the port side. Globes are used on buoys on the starboard hand, and cages on the port. When a middle ground exists in a channel, each end of it is marked by a buoy with horizontal *white* stripes. Wrecks are marked by *green* buoys. All buoys have their names painted on them in conspicuous letters.

FRANCE.—On entering a channel from seaward, all buoys and beacons painted *red* with a *white* band near the summit, must be left to starboard; those painted *black* must be left to port. Buoys that can be passed on either side are painted *red* with *black* horizontal bands. That part of a beacon below the level of high water, and all warping buoys, are painted *white*. The small rocky heads in frequented channels are colored the same as beacons when they have a surface sufficiently conspicuous. Each buoy or beacon has upon it the name of the danger it is intended to point out, and also its number, commencing from seaward. The even numbers are on the red buoys, and the odd numbers on the black. The buoys that can be passed on either side are named but not numbered.

HOLLAND.—The same as Belgium.

SCOTLAND.—Coming from seaward, leave the *red* buoys on the starboard hand, and the *black* buoys on the port. *Red and black* buoys are placed on detached dangers, and may be passed on either side. Wrecks are marked by *green* buoys. Fairway buoys are plainly marked, and all buoys have their names painted on them. Liverpool is buoyed on the same system.

BUOY-ROPE. The rope which attaches the buoy to the anchor; it should always be of sufficient strength to lift the anchor should the cable part.

BUOY-ROPE KNOT. A knot made by unlaying the strands of a cable-laid rope, and also the small strand of each large strand; and after single and double walling them, as for a stopper-knot, worm the divisions, and round the rope.

Burbot. A fish of the genus *Lota*, shaped like an eel, but shorter and thicker, with a flat head, having on the nose two small beards and another on the chin. Sometimes called an *eel-pout*.

Burden. The quantity of merchandise that a ship carries when properly trimmed. See TONNAGE.

Bureau. A department of government. In most European countries the highest departments of government receive the name of *bureaus*. In England and the United States the term is confined to subordinate departments, as Bureau of Ordnance. See ORGANIZATION.

Burgall. A fish of our eastern coasts, from 6 to 12 inches long; also called the blue-perch, the chogset, and the nibbler,—the last from its habit of nibbling off the bait thrown for other fishes.

Burgee. A swallow-tailed flag; in the merchant service it generally has the ship's name on it.

Burgomaster. In the Arctic Sea, a large species of gull (*Larus glaucus*).

Burgoo. A dish made of boiled oatmeal seasoned with salt, butter, and sugar.

Burgoyne, Hugh Talbot. Born in 1833. Only son of Sir John Burgoyne, Royal Engineers. He was a captain in the English navy. During the Crimean war, while still a junior officer, he commanded a small but active vessel. For his action at Kinburn he was made one of the first recipients of the Victoria cross. At the close of the war he was made Knight of the Legion of Honor, and received the order of Medjidie. After this he was rapidly promoted. He was lost while in command of the Coles turret-ship "Captain," which foundered off Cape Finisterre, September 7, 1870. The "Captain" had an extremely low free-board, and was built by Laird, of Birkenhead, under the supervision of her designer, Captain Coles, and Captain Burgoyne. During her first cruise, in May, 1870, Admiral Sir Thomas Symonds reported her as behaving extremely well in all weather, using her heavy guns readily in a seaway, very stable, and especially handy under sail. She capsized, however. Her constructor, Captain Cowper Coles, R.N., perished in her, with 542 out of 560 souls, who composed her complement.

The former chief constructor of the Royal navy, Mr. E. J. Reed, had always declared that the "Captain" was unseaworthy.—*E. Shippen.*

Burley-twine. A strong coarse twine.

Burnettizing. A process for the preservation of timber. The timber is immersed in a solution of chloride of zinc for a certain period, which depends upon the size of the timber.

Burn the Water. A phrase denoting the act of killing fish at night with a gig. The fishermen have a torch in the boat; hence the phrase.

Burr. The hazy c[illegible]le which appears around the moon before rain.

Burrel. Langrage shot, consisting of bits of iron, bullets, nails, etc., got together in haste for a sudden emergency.

Burrock. A small weir over a river, where weels are laid for taking fis[illegible].

Burr-pump. A name fo[illegible] the bilge-pump.

Burser. See PURSER.

Burster-bag. A bag for [illegible] bursting charge of a shell.

Bursting Charge. The [illegible]ice charge of a shell as distinguished from [illegible]lowing charge. In some shells the bursting [illegible] is inclosed in a bag as a guard against pr[illegible]e explosions.

Burt. A flat fish of the [illegible]kind.

Burthen. See BURDEN

Burton. A tackle used [illegible]us purposes; as, swaying aloft a topsa[illegible]ting a yard, etc. A *top-burton* is kept [illegible] the pendants at the topmast-head. It i[illegible]ckle, and is long enough to permit the [illegible]k and hauling part to come down to [illegible] The fall of the main top-burton is th[illegible]piece of rigging in a ship. See SPAN[illegible]N.

Burt's Nippers. An a[illegible]metimes attached to a deep-sea lea[illegible] allows the line to run readily throu[illegible]he lead is descending; but as soon [illegible] trikes the bottom, releasing the te[illegible] [illegible]ne at the surface of the water.

Bush. A perforated piece of metal let into certain parts of machinery to receive the wear of pivots, journals, etc. Any similar lining of a hole with metal; as, the vent of a gun. The bush or bushing of the vent of a gun is made of pure copper; the outer orifice is faced with steel, and the inner orifice, in heavy guns, is lined with platinum.

Bushing. See BUSH.

Bush-metal. An alloy of copper and tin.

Bushnell, David, of Connecticut, was the first to show practically that a charge of gunpowder could be fired under water, and is therefore entitled to the credit of inventing torpedoes or submarine mines (1775).

Busking. Piratical cruising. Beating to windward along a coast, or cruising off and on.

Buss. A small strong-built Dutch vessel with two masts, used in the herring and mackerel fisheries, generally of 50 to 70 tons burden.

Bust-head. See FIGURE-HEAD.

Busy as the Devil in a Gale of Wind. Fidgety restlessness, or double diligence in a bad cause; the imp being supposed to be mischievous in hard gales.

But. A conical basket for catching fish.

Butcher's Bill. A nickname for the official return of killed and wounded which follows an action.

Butescarli. The early name for the sea-officers in the British navy.

Butt. A wine measure of 126 gallons. The large end of the stock of a fire-arm. A target; hence a person at whom are leveled the shafts of sarcasm or ridicule. The joining of two timbers or planks endways; also the ends of the timbers or planks so joined. The largest end of any timber or plank. *To start* or *spring a butt* is to loosen the end of a plank by the laboring of the ship.

Butt-and-butt. A term denoting that the butt ends of two timbers meet but do not overlap.

Butter-box. A name given to the brig-traders of lumpy form, from London, Bristol, and other English ports. A cant term for a Dutchman.

Butter-bump. A name of the bittern.

Butter-fingered. Having a careless habit of allowing things to slip through the fingers.

Buttock. The after-part of the ship on each side below the knuckle. A ship is said to have a broad or narrow buttock according to her transom convexity under the stern.

BUTTOCK-LINES. Represented on the sheer draught as curve lines cutting the ship into vertical longitudinal sections parallel to the centre line.

Button. The knob of metal which terminated the breech-end of old guns, and which afforded a convenient bearing for the application of handspikes, breechings, etc.

Buttons, To Make. A common time-honored, but strange expression for sudden apprehension or misgiving.

Butt-shaft, or Butt-bolt. An arrow without a barb, used for shooting at a butt.

By. Being, or passing, near. *By the wind*, as near the wind as possible. *Full and by*, rap-full, but close to the wind. *By and large*, to the wind and off it. *Stand by!* Be prepared. *By the board*, over the ship's side; a mast carried away near the deck is said to go *by the board.* A ship is *down by the head* (or *stern*) when she draws more water forward (or aft) than she does when she is in her proper trim.

Bykat. A term for a male salmon of a certain age, because of the beak which then grows on its under-jaw.

Byllis. An old spelling for *bill.*

Byrth. The old expression for tonnage.

Byssa. An ancient gun for discharging stones at the enemy.

Byssus. The silken filaments of any of the bivalved mollusks which adhere to rocks, as the *Pinna*, *Mytilus*, etc. The silken byssus of the great pinna, or wing-shell, is woven into dresses. In the *Chama gigas* it will sustain 1000 pounds. Also, the woolly substance found in damp parts of a ship.

By-wash. The outlet of water from a dam or discharge channel.

C.

C. Abbreviation for *can* in the U. S. General Service Signal Code. Among the letters used in the log-book to register the state of the weather *c* denotes *cloudy*.

Caaing Whale (*Globicephalus deductor*). A cetacean belonging to the genus *Delphinus*, but differing from the other *Delphinidæ* in having the phalanges more numerous and the limbs lower and more approximated in position. It resembles the common porpoise in general form, but is much larger, measuring from 16 to 24 feet in length, and rather more than 10 feet in circumference at its thickest part, which is at the root of the dorsal fin, whence the body tapers towards the tail, which is deeply forked. In color it is black, with a white streak on the under side. Its pectoral fins are long and narrow. Its vertebræ number 55. It is very gregarious, and is found on the coasts of Great Britain, North America, and Iceland, while other species of the same genus exist in the South Seas and the North Pacific. It is most frequently taken on the Scottish coast, whence also it derives its name, the word "caaing" being Scotch for "driving." The animal is so called from the fact that owing to its sheep-like propensity to follow its leader, the fishermen, having hemmed in a herd between their boats and the shore, are enabled to drive the whole herd into shallow water, where, becoming stranded, they fall an easy prey, and form a rich booty to their pursuers.

Cabane. A flat-bottomed passage-boat of the Loire.

Cabin. In passenger steamers the cabin is a large apartment which is occupied by the better class of passengers. In it are the *state-rooms* or private rooms of the passengers, and the space between the rows of state-rooms is the *saloon*, which is for the accommodation of the passengers in general, and is frequently used as a dining-room. In large vessels there are two or three cabins, in which case they are occupied, respectively, by the first-, second-, and third-class passengers. In an ordinary merchant vessel the cabin is the apartment occupied by the master of the vessel.

In a man-of-war the cabin is the apartment occupied by the cabin-officers. Cabin-officers are the commanding officer and other line-officers of and above the grade of commander, whether they are on duty or attached to the ship as passengers. In large vessels there are two cabins, one on the main deck and one on the upper deck. The cabin is frequently divided into compartments by light bulkheads, and two or more state-rooms are formed in the same manner. When there is a flag-officer on duty on board a vessel having two cabins, he selects one for his own use and the commanding officer occupies the other; when there is but one cabin, the commanding officer is entitled to one-third of the space, divided off by a fore-and-aft bulkhead.

CABIN-BOY. A boy whose duty it is to wait on the officers and passengers in the cabin.

CABIN-LECTURE. A severe but private reprimand. See JOBATION.

Cable. A large strong chain, or rope made of hemp, manilla, or coir, used to retain a ship in place when at anchor. Rope for cables is cable-laid, to render it impervious to water, but the additional twist given in laying it up detracts from the strength, the cable-laid being 30 per cent. weaker than plain-laid rope of equal size. Cables vary in size from 10 to 26 inches. Rope-cable has been superseded by chain.

Chain for cables for the navy is manufactured at the Washington navy-yard. The utmost care is taken to procure good iron; each bar is tested, and the links are carefully welded. A cast-iron stud is inserted in each link, except those at the ends of the sections; the object of the stud is to strengthen the chain and keep it from kinking.

Chain-cables are 120 fathoms long, a shackle being introduced at each section of 15 fathoms, and a swivel at 7½, 37½, and 82½ fathoms. The object of the swivel is to keep the chain from getting full of turns.

Chain-cables are marked at the shop in the following manner: each shackle is marked across the eye with its number; the swivels and club-link are marked with the number of the chain, the date, place of manufacture, and the initials of the inspector.

On the stud are cast the initials U. S. and W. N. Y., and also the size of the chain in figures.

Table for Proof of Cables.

Size of Cable.	Pounds Strain Single Proof.	Double Proof for Triplets.
2¼ inch	147,800	295,600
2⅛ "	134,400	268,800
2 "	117,600	235,200
1⅞ "	100,800	201,600
1¾ "	87,800	175,600
1⅝ "	78,000	156,000
1½ "	66,600	133,200
1⅜ "	56,000	112,000
1¼ "	44,800	89,600
1⅛ "	34,600	69,200
1 "	26,800	53,600

Chain-cables differing 1-16 inch in size are not manufactured now.

The triplets are cut from the chain to be issued, and are tested to destruction, but must stand the double proof before breaking.

Cables issued to the service are pulled to single proof only.

After the cable has stood the required test given in the proof-table, it is examined by an expert, to see if there are any defects in the welding.

A *shot* of cable, two cables spliced together.

To pay out or *veer cable*, to let more cable run out of the hawse-hole. *To bitt the cable*, to take a turn with the cable around the bitts. *To stopper the cable*, to secure it by means of pieces of ropes, called stoppers, attached to the deck or bitt. (See STOPPER.) *To buoy the cable*, to attach buoys to the bight of the cable to keep it clear of the ground. *To coil a cable*, to lay it in fakes and tiers. *To bend a cable*, to clinch or shackle it to the ring of the anchor. *To range a cable*, to lay it along the deck in parallel lines. *To slip the cable*, to let go the inboard end and allow it all to run out. *Cable enough!* the cry from the forecastle when sufficient cable has been veered to allow the anchor to be catted.

CABLE-BENDS. Two small ropes for lashing the end of a cable to its own part, in order to secure the clinch, by which it is made fast to the anchor.

CABLE, BOWER-. The cable belonging to a bower-anchor.

CABLE-BUOY. A cask used to buoy up the bight of a cable.

CABLE, ELECTRICAL. An insulated wire or combination of wires used in telegraphy or in firing mines. The essential qualities are strength, pliability, and high insulation. The substances generally used for insulating a cable are gutta-percha, india-rubber, and Hooper's material; the latter is considered to be the best. To protect the insulating material from chafe over rocks, cables are generally provided with an external metallic covering.

CABLE-LAID ROPE. Three plain-laid ropes laid up into one rope, thus forming a nine-stranded left-handed rope.

CABLE, SHEET-. The cable belonging to the sheet-anchor.

CABLE'S LENGTH. One-tenth of a sea-mile, about 100 fathoms.

CABLE-STAGE. A platform in the hold on which are coiled the cables and hawsers.

CABLE, STREAM-. A hawser or large rope used with a stream-anchor.

CABLET. A cable-laid rope of less than 10 inches in circumference; a hawser.

CABLE-TIER. The place where cables and hawsers are stowed.

Cabon. An old word for a nipper.

Caboose, or **Camboose.** The cook-room or kitchen of merchantmen, on deck; a diminutive substitute for the galley of a man-of-war; the term is sometimes applied to a portable cast-iron stove used in coasting-vessels for cooking on deck.

Cabot, John. See CABOTO, GIOVANNI.

Cabot, Sebastian. One of the sons of Giovanni. He survived his father and brothers, and earned a high reputation as an explorer. Born at Bristol, England claims him as one of her sons. After the death of Henry VII. he entered the service of Spain, and became a member of the Council of the Indies. In the reign of Henry VIII. he commanded an expedition in search of the Northwest passage, "the dream of all the greatest navigators since the close of the fifteenth century." The object of the expedition was defeated by the pusillanimity of Admiral Pert. Cabot, however, turned the frustrated mission to account by observing the dip of the needle and the variation of the compass in those regions, and by forming plans for the accurate determination of the longitude. In 1520, Cabot left the service of the king of England, and accepted the grade of pilot-major under the government of Charles V. of Spain. By that monarch he was appointed captain-general of an expedition to Cape Horn and the Pacific shores of South America; but through the jealousy of his subordinates his operations were confined to the Rio de la Plata and its tributary streams. Withdrawing from the Spanish service in 1548, he once more settled in Bristol, and Edward VI. of England employed him in a capacity corresponding with that of a first lord of the Admiralty. As superintendent of the shipping and foreign commerce of England, Cabot destroyed the monopoly of a grasping company, and improved the public revenues by encouraging the principles of free trade. He then founded a Society of Merchant Adventurers, and in that capacity sent out ships with keels of lead as a precaution against the worm. Some years later he closed a useful life, and was posthumously panegyrized as the most scientific seaman of the age, and one of the gentlest, bravest, and best of men, who gave to Britain not only a large continent but the untold riches of the deep in the fisheries of Newfoundland and the Arctic Sea. He was, in fact, the father of free trade.

Cabotage (*Ital.*). Sailing from cape to cape along a coast, or the details of coast pilotage.

Caboto, or **Kaboto, Giovanni** (JOHN CABOT), obtained a patent from Henry VII., King of England, empowering him and his three sons to sail into the eastern, western, or northern seas, with a fleet of five ships, at their own expense, to search for islands, countries, provinces, or regions not before seen by Christian people; to float the English flag on any city, island, or continent that they might find, and, as vassals of the English crown, to possess and occupy the territories so discovered. The expedition sailed from Bristol, May, 1497, and the Cabots sighted Labrador. In the following year they made a second voyage, and got as far as Maryland, having previously discovered Newfoundland. In 1499 they made a third voyage, extending to the Gulf of Mexico. See SEBASTIAN CABOT.

Cabral, or **Cabrera, Pedro Alvarez,** the discoverer of Brazil, was descended from an old and patrician Portuguese family. Nothing is known of his early life save the fact that he must have recommended himself by talent and enterprise to King Emanuel, of Portugal, who, after the first voyage of Vasco de Gama, appointed Cabral to the command of a fleet of 13 vessels, carrying 1200 men, and bound for the East Indies. On the 9th of March, 1500, he sailed from Lisbon. To avoid the inconvenience of being becalmed on the coast of Africa, he took a course too far westerly, fell into the South American current of the Atlantic, and was carried to the unknown coast of Brazil, of which he claimed possession for the king of Portugal, April 24, 1500, naming the new country "Terra da Santa Cruz." After sending home one vessel to bear news of this great accidental discovery, Cabral sailed for India; but on the 29th of May four of his vessels foundered, and all on board perished, including Diaz, the great navigator; and soon afterwards three more vessels were lost. Cabral therefore landed at Mozambique, on the east coast of Africa, of which he

first gave clear information, and also discovered (August 23) the Antschedives Islands, of which he described correctly the position. Hence he sailed to *Calicut*, where, having made the terror of his arms felt, he was permitted to found a factory; entered into successful negotiations with native rulers, and thus established the first commercial treaty between Portugal and India. He returned from India, bringing with him a considerable booty, and arrived in the port of Lisbon July 31, 1501. It appears probable that the king was dissatisfied with the results of the expedition (although it had annexed Brazil to the crown of Portugal), for subsequently we find no mention made of Cabral among other discoverers. At the request of Cabral, Sancho de Toar wrote a description of the coast of Sofola. Cabral's voyages are described in Ramusio's "Navigatione e Viaggi," 3 vols. (Venice, 1563; new ed., Venice, 1835.)

Caburn. A small line made of spun-yarn, for worming cables, seizings, and the like.

Cacao (*Sp.*). The plant *Theobroma*, from which cocoa is derived.

Cache (*Fr.*, a place of concealment). Explorers and other travelers in waste regions wishing either to disencumber themselves of a portion of their *impedimenta*, or to establish magazines for use on their return journey, frequently bury in the ground provisions and articles of equipment. The place of such a deposit is termed a *cache*, and the process of making it, *cacheing*.

Cacholot, Spermaceti, or Sperm Whale (*Physeter macrocephalus*, or *Catodon macrocephalus*). One of the largest of the *Cetacea* (which see), and of very peculiar form. Unlike the right whale, it affords no whalebone, but is much sought after, not only on account of the oil, but still more for the spermaceti and ambergris which it yields. It is widely distributed geographically and inhabits nearly all seas, but is most abundant in those of the southern hemisphere. It sometimes attains the length of 70 or 80 feet. The general color is very dark gray, nearly black on the upper parts but lighter beneath. Old males, or, as the South-Sea whalers call them, old bull-whales, usually have a large gray spot on the front of the head. The head is enormously large, forming about one-half of the entire bulk of the animal, and taking up more than one-third of the whole length. From the head the body tapers to the tail, and at last rather rapidly. The muzzle is very obtuse, almost as if suddenly cut off in front, the breadth of it almost equaling the thickness of the body. In a protuberance on the upper part of it is the blow-hole, which is single, situated a little on the left side, and in form not unlike the letter S elongated. The mouth is very wide, and the throat, unlike that of the Greenland whale, is sufficiently capacious to admit the whole body of a man. The upper jaw projects some feet beyond the lower, and has neither teeth nor whalebone; but the lower jaw contains twenty or twenty-five teeth on each side, according to the age of the animal. The teeth, which are conical and slightly recurved, project about two inches from the gum. The lower jaw is very narrow, its two branches being for most of their length in contact; it fits into a groove in the upper jaw, in which are cavities for the teeth. The eyes are small and placed far back in the head above the angles of the mouth; the left eye is said to be smaller than the right. Just above the eyes the dorsal line rises considerably; the dorsal fin is also represented by a protuberance about half-way between the neck and tail, and these parts are seen above water in the ordinary swimming of the animal, which is at the rate of from 3 to 7 miles an hour and just beneath the surface of the water, although when alarmed it swims more swiftly and strikes the water with its tail upward and downward with great force. The pectoral fins are small, and seem scarcely, if at all, to aid in progression, which is accomplished by the large and powerful tail-fin. The tail-fin is very broad and is divided into two lobes, called by the South-Sea whalers the *flukes*. The head of the cacholot is in great part occupied by a cavity in front of and above the skull, called by whalers the *case*, which is a receptacle for spermaceti (which see). This substance being light, the animal in swimming raises its head above the surface of the water, which it also does when at rest. The case frequently holds not less than ten large barrels of spermaceti. It is not formed of bone, but of a strong tendinous integument, and is divided into compartments which communicate with each other. The substance which it contains is in a semi-fluid state, but hardens on cooling; it consists of spermaceti and oil. The oil is separated by drawing and squeezing, and the spermaceti further purified till, instead of being a yellow, unctuous mass,—the state in which it is brought home by the whalers,—it assumes a beautiful pearly white, flaky, nearly crystalline appearance. When the spermaceti whale is killed and towed alongside the whaling-ship, the case is emptied of its valuable contents through a hole made in front of the muzzle, and by means of a basket attached to a pole. The spermaceti used to be considered the brain of the whale; what purpose it serves is not known, except that already alluded to of giving buoyancy to the fore part of the animal, and perhaps this is its chief use, respiration even more than progression depending on it. It is distinct enough from the brain, which, as well as the skull that contains it, is very small compared with the bulk of the creature. Cavities filled with spermaceti are distributed over the body, and even ramify through the external fat or blubber, although the principal mass is in the head. The blubber of the cacholot is not nearly as thick as that of the Greenland whale, being only about 14 inches in thickness on the breast of a large whale, and from 8 to 11 inches on other parts of the body. It is called by whalers the *blanket*, is removed from the captured whale in great strips, and is heated in large pots, the skin of the whale serving for fuel, when the oil—known as sperm oil (which see)—flows from it. The *junk*, a thick elastic mass, which occupies the fore part of the head immediately under the case, yields also a considerable quantity of sperm oil. The cacholot feeds principally upon squids and cuttle-fish. It goes in herds, which are called *schools* by the sailors. Large herds consist generally of females with only a few males; herds of young males also occur. When solitary individuals are met with, they are almost always old males. Terrible conflicts often take place among the males, and it is not unusual to find the lower jaw dislocated or broken as a result of these encounters.

Cade. A small barrel of about 500 herrings or 1000 sprats.

Cadence. The regularity requisite in pulling. A uniform time and pace in marching indispensable to the correct movements of troops.

Cadet. A French word signifying younger, junior. This term is also applied in France and other countries to a student in the art of war and military science.

CADET ENGINEER. The lowest grade of the engineer corps in the U. S. navy; so called during their state of pupilage at the Naval Academy and up to the time of their promotion to assistant engineer.

CADET MIDSHIPMAN. The lowest grade of line-officers in the U. S. navy; so called while pupils at the Naval Academy and during a probationary period of sea service, at the expiration of which they are promoted to midshipman. See ACADEMIES, NAVAL.

Cadge. To carry. Kedge may be a corruption.

Cadiz. A city and seaport of Spain, capital of the province of Cadiz, on the island of Leon, off the S.W. coast of Andalusia, 60 miles N.W. of Gibraltar, and 64 miles S. of Seville. Lat. 36° 32′ N.; lon. 6° 17′ 15″ W. It stands on a narrow tongue of land, which projects about 5 miles N.N.W. into the sea; it is surrounded on three sides by water, and is strongly defended both by nature and by art. The entrance to its capacious bay is commanded by forts, while on the other sides large vessels cannot approach within three-fourths of a mile of the city. One of the most conspicuous objects in Cadiz is the light-house of San Sebastian, 172 feet in height. The bay, which is formed by the peninsula and the mainland, is spacious, and affords good anchorage. *La Caraca*, the royal dockyard, is situated at the bottom of the inner bay, about 6 miles from the city, and is defended by the cross-fire of two forts. It contains 3 spacious basins, and 12 docks or slips. The trade of Cadiz is less extensive than formerly. The chief article of export is sherry wine. Salt is another article of export. The chief imports are staves, tobacco, hides, cacao, indigo, cochineal, dye-woods, sugar, codfish, and coals. Pop. 58,000.

Cælum. See CONSTELLATION.

Caffila. See KAFILA.

Cag. See CARRY.

Cage. An iron cage, formed of hoops, on the top of a pole, and filled with combustibles. It is lighted before high water, and marks a channel, navigable for the period during which it burns.

Cage-work. An old term for a ship's upper works.

Caique, or Kaique. A small Levantine vessel. Also, a graceful skiff, seen in perfection at Constantinople, where it almost monopolizes the boat traffic. It is fast but crank, being so narrow that the oars or sculls have their looms enlarged into ball-shaped masses to counterbalance their outboard length. It has borne for ages the wave-line, which, upon its introduction into our marine architecture a few years ago, was esteemed a novelty. It may have from one to ten or twelve rowers.

Cairban. A name in the Hebrides for the basking-shark.

Cairn. A pile of stones used as a mark in surveying.

Caisson. A boat-gate, having generally both ends similar in form to the bows of a vessel, used to close the entrance to a dock or basin. An apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure sunk by letting water into it. There is an air-chamber inside, which allows it to sink only a certain depth. In that state it is hauled under the ship's bottom, the traps or openings are closed, the water is pumped out, and the caisson rises with the ship upon it. In another arrangement, a platform is sunk to a certain depth in the water, and is suspended by iron screws from a strong wooden framework; the ship is floated upon the platform, steadied by shores, and lifted high and dry by means of levers, wheels, pinions, and screws. In military matters, an ammunition-chest and the wagon on which it is carried. The term is also applied to a chest loaded with explosives and buried deep in the ground under a fortification for the purpose of being blown up if the enemy approach and take possession of that particular part of the work.

Calais. A town of France, department of Pas-de-Calais, on the Strait of Dover, 26 miles E.S.E. of Dover, and 20 miles N.E. of Boulogne. Lat. of the new light-house, 50° 57′ 45″ N.; lon. 1° 51′ 18″ E.; height, 192 feet. The tower and harbor are defended by a castle and several forts, and by means of sluices the whole adjacent country may be laid under water. The harbor is formed by two moles, which are continued seaward by wooden piers, the whole being about three-fourths of a mile in length. At ebb-tide it is nearly dry; has not a greater depth than 15 or 18 feet at high water. A tower in the centre of the town serves as a light-house. There is good anchorage ground 2 to 3 miles N.W. of the harbor. Pop. 20,000.

Calais, a city of Washington Co., Me., is on the St. Croix River. It is at the head of navigation, about 12 miles from Passamaquoddy Bay, 82 miles E.N.E. of Bangor, and 27 miles N.N.W. of Eastport. Pop. 6000.

Calamary (*calamus*, a pen). A Cephalopod, which derives its name from the fact of its body containing a *gladius*, or internal shell, shaped like a quill, and a bag in its visceral sac from which it diffuses an ink-like fluid. Its mouth is furnished with eight arms. The different species are distributed over all parts of the world, but are much more abundant in some seas than in others; they form a principal part of the food of some of the larger fishes and of whales. It is the *Loligo vulgaris* of Cuvier.

Calamine. An ore, consisting essentially of silicate of zinc. Its primary form is a rhomboid, and it occurs in small obtuse-edged crystals, also compact and massive. It is white, yellowish white, brown, green, or gray; is sometimes opaque, sometimes translucent, is brittle, and has an uneven conchoidal fracture. It occurs in beds and veins in rocks of various kinds, but most commonly in limestone.

Calanca. A creek or cove on the Italian and Spanish coasts.

Calcutta, capital of British India and of Bengal, is situated on the E. bank of the Hoogly River, 80 miles from the sea, in lat. 22° 33′ 47″ N., lon. 88° 23′ 34″ E., opposite the town of Howrah, to which a floating-bridge extends.

Calcutta is the largest emporium of trade in Asia, being the natural outlet of the valleys of the Ganges and Brahmapootra. The chief exports are jute, opium, indigo, rice, hides, raw silk, saltpetre, etc., and the chief imports are cotton, linen, and silk goods, hardware, wines, spirits, and salt. Pop. city proper, 448,000; including suburbs, about 900,000.

Calendar (Lat. *calendæ*, the first day of each month, from *calāre;* Gr. *kalein*, to call, to summon). The regulation, arrangement, and register of civil time. The natural unit adapted to the immediate wants and ordinary occupations of man is the *solar day*, or the period elapsed between two successive arrivals of the sun at a given meridian. It varies in length at different seasons of the year; but the variation is socially unimportant, and the tacit adoption of its *mean value* from the earliest ages arose probably from ignorance that such fluctuation existed. This *mean solar* or *civil* day is divided into 24 hours. The unit for longer duration again is naturally the period in which recur the seasons on which depend all the vital business of life. It is the interval between two successive arrivals of the sun at the vernal equinox, and is called the *tropical year*. This period varies slightly, and is incommensurate with the lesser unit, its length being about 365 days 5 hours 58 minutes 59.7 seconds. Now, if the odd hours, minutes, etc., were to be neglected, and the *civil year* made to consist of 365 days, the seasons would soon cease to correspond to the same months, and would run the round of the whole year; this odd time must therefore be taken account of. But then, again, it would be very inconvenient to have the same day belonging to two different years. To obviate this difficulty, a very neat contrivance was inaugurated by Julius Cæsar. He introduced a system of *two* artificial years, one of 365 and the other of 366 integer days; three consecutive years of 365, and then a fourth year of 366 days. The longer years were called "bissextile" or "leap-years," and the surplus days formed of the accumulated fractions and thrown into the reckoning were called "intercalary" or "leap-days." This calendar made the average length of civil years 365 days 6 hours, which was only a rough approximation to the truth, and the error soon accumulated to a whole day. A reformation was effected by Pope Gregory XIII.; and his law for regulating the succession of the two artificial years (of 365 days and 366 days) is such, that during the lapse of at least some thousands of years the sum of these integer-day years shall not differ from the same number of real tropical years by a whole day. For the period of 10,000 years the average length of the Gregorian year is 365.2425 days, which is a very close approximation to the mean tropical year, 365.242264 days (according to Delambre's tables). The Gregorian rule is as follows: The years are denominated as years *current* (not as years *elapsed*) from the midnight between the 31st of December and the 1st of January immediately subsequent to the birth of Christ, according to the chronological determination of that event by Dionysius Exiguus. Every year whose number is not divisible by 4 without remainder consists of 365 days; every year which *is* so divisible, but is not divisible by 100, of 366 days; every year divisible by 100, but not by 400, again of 365; and every year divisible by 400 again of 366 days. The principle might be applied further, and any degree of approximation attained. In our calendar the year is arbitrarily divided into 12 unequal months, the intercalary day being placed at the end of the shortest.

Calf. A word generally applied to the young of marine mammalia, as the whale. *Calf*, in the Arctic regions, a mass of floe-ice breaking from under a floe, which when disengaged rises with violence to the surface of the water; it differs from a tongue, which is the same body kept fixed beneath the main floe. The iceberg is formed by the repeated freezing of thawed snow running down over the slopes, until at length the wave from beneath and weight above causes it to break off and fall into the sea, or, as termed in Greenland, to calve. Thus, berg, is fresh-water ice, the work of years; the floe, is salt water frozen suddenly each winter, and dissolving in the summer.

Calf, or Calva. A Norwegian name, also used in the Hebrides, for islets lying off islands, and bearing a similar relation to them in size that a calf does to a cow; as, the Calf at Mull and the Calf of Man.

Calfat. The old word for calking. (*Calfater*, Fr.; probably from *cale*, wedge, and *faire*, to make.) To wedge up an opening with any soft material, as oakum. (*Calafatear*, Sp.)

Caliber, or Calibre. The diameter of the bore of a gun, cannon-shot, or bullet. A ship's calibre means the known weight her armament represents.

Calipash. The upper shell of a turtle.

Calipee. The under shell of a turtle.

Calipers, or Caliper Compasses. Bow-legged compasses used to measure the girth of timber, the external diameter of masts, shot, and other circular or cylindrical substances. Calipers of the best sort are made with a scale, having different sets of numbers engraved on it, like a sliding-rule, for the purpose of exhibiting at once various relations depending on the magnitude of the diameter of the body measured. Thus, as the weights of balls of the same metal are in a constant ratio to the cubes of their diameters, the scale may be so graduated and numbered that the observer may read off either the diameter in inches or the weight in pounds. Other numbers having a less immediate application are also frequently attached; for example, the degrees of a circle, the proportions of troy and avoirdupois weight, tables of the specific gravities and weights of bodies, etc. It is obvious that these may be varied infinitely according to the purposes proposed to be accomplished. Also an instrument with a sliding leg used for measuring the packages constituting a ship's cargo, which is paid for by its cubical contents.

Calk. To drive oakum into the seams between the planks in the sides and decks of a vessel, in order to prevent the entrance of water. The seam is first widened as much as possible, and the oakum is then forced in thread by thread. The oakum is driven until it forms a dense mass, when the seam is payed or coated over with hot pitch. The first people to make use of pitch in calking were the inhabitants of Phæacia. Wax and resin had been previously used, and a kind of unctuous clay has been made use of for the

same purpose. In the East a very hard cement, known as *chunam*, is used for the seams of vessels. *To calk* also means to sleep on deck with clothes on.

CALKER. One who calks and pays seams.

CALKER'S SEAT. A box slung to the ship's side whereon a calker sits when calking. It contains the calker's tools and oakum.

CALKING-BUTT. The opening between the ends of planks when worked for calking.

CALKING-IRONS. Peculiar chisels used in calking; there are several kinds, as the calking-iron, the making-iron, the rasing-iron, and the reeming-iron.

CALKING-MALLET. The wooden mallet or beetle used in driving the calking-irons.

Call. A signal made by a drum, bugle, trumpet, or boatswain's pipe. A peculiar silver whistle or pipe used by the boatswain and his mates to summon the men to their stations and to direct them in their various duties. This is done by sounding various strains, each of which is a signal to do a particular thing; as, belay, veer, walk away, sweep down, etc. The act of winding this instrument is called *piping*. In early times a gold call and chain was the badge of an admiral.

Calliope. An instrument which consists of a series of steam-whistles toned to produce musical notes; the valves by which steam is admitted to the whistles are operated by keys arranged like those of an organ. It is sometimes placed on the hurricane-deck of steamboats on the western rivers.

Call the Watch. The order to turn out the watch below to relieve the watch on deck. See WATCH.

Calm. A word used to denote the state of the weather when there is no perceptible wind. It is characterized as being *flat*, *dead*, or *stark*. In a calm, under canvas, it is customary to haul up the courses, brail up the trysails, counter-brace, and wait for a breeze. When two vessels are very near each other in a calm their heads should be kept in different directions, otherwise they would collide, on account of the attraction between the two bodies and the undulating motion of the sea, which causes vessels to forge ahead even in a calm. For the same reasons a vessel becalmed near the land should keep her head to seaward. A heavy cannonading will sometimes occasion a calm, and a large fire will cause a breeze to spring up, the wind coming in from all directions towards the fire.

CALM LATITUDES. The tract of ocean between the northeast and southeast trade-winds. Its situation varies several degrees, depending upon the season of the year. The term is also applied to the calm belt on the polar side of the trades. (See HORSE LATITUDES.) The calm latitudes were almost as much dreaded by the mariner as the region of storms. During a calm of many weeks food and water were likely to be exhausted at a point too far from land for a boat to reach it. Since the introduction of steam and the apparatus for distilling water, the calm belts have lost the greater portion of their terrors.

Calorimeter. An instrument for measuring quantities of heat. It consists essentially of a vessel containing a known weight of some convenient liquid, such as water or mercury; a thermometer for indicating the temperature of that liquid; and, if necessary, an agitator for making the liquid circulate. Experiments are performed by immersing in the liquid or mixing with it a known weight of the substance to be experimented on, at a known temperature different from the temperature of the liquid, and noting the common temperature of the liquid and the immersed substance when equilibrium of temperature is restored, taking care that all losses of heat, and other sources of error, are ascertained and accounted for.

This term is sometimes, though improperly, applied to the cross sectional area of boiler tubes.

Cam, or Wiper. In mechanism, a device by which any desired variety of relative motion may be obtained. It consists of either a continuously rotating or an oscillating body which, by the shape of its face or edge, or by a groove in its side or face, drives a sliding or turning piece either with constantly varying, regular, or intermittent motion. It is extensively used in fabricative machinery, such as the printing-press or sewing-machine. In steam-engines it is applied only to valve-gear.

CAM-SHAFT. A shaft carrying a cam.

CAM-ROLLER. A roller that acts on the face or in the groove of a cam.

CAM-WHEEL. A wheel driving or carrying one or more cams, and which may, by itself, communicate a motion different from that of the cams.

Cambala. Marco Polo's name for Pekin.

Camber. In ship-building, a term for anything which rounds, but chiefly to express the camber to the ways for the launching of a ship.

CAMBER-KEELED. Having the keel arched upwards, but not actually hogged.

Camboose. See CABOOSE.

Camden. A city and port of entry, capital of Camden Co., N. J., on the Delaware River, opposite Philadelphia. Its river front extends from Cooper's Creek on the north to Newton Creek on the south. Cooper's Creek is navigable beyond the city limits. Pop. 37,000.

Camel. A water-tight structure placed beneath a vessel in the water to raise it. Camels were invented by the Dutch, about 1688, for carrying vessels into harbors where the depth of water would not otherwise permit them to enter. They consisted of two large water-tight boxes or half ships, built in such a manner that they could be applied to each side of the hull of a vessel. When about to be used water was allowed to run into them, and when they sank to the required depth they were firmly secured to the ship's hull. The water was then pumped out, and the camel rose, bringing up the vessel with it. The camels in use in Holland are upwards of 100 feet in length and 20 feet in breadth.

Camels are frequently used to raise sunken bodies.

Cameleopardalis. See CONSTELLATION.

Camfer. See CHAMFER.

Camock. A very early term for crooked timber.

Campeachy. A town of Mexico, capital of the state of Campeachy, on the bay of the same name, 90 miles S.S.W. of Merida. Lat. 19° 50′ N.; lon. 90° 33′ W. The harbor is capacious but shallow, and vessels drawing more than 6

feet of water are compelled to anchor 3 miles from the shore. Notwithstanding this disadvantage, vessels measuring 100 feet of keel are built here. Pop. 18,500.

Canaiche, or Canash. An inner port, as at Granada in the West Indies.

Canal. An artificial channel filled with water, formed for the purposes of inland navigation. The section of a canal is usually a trapezium, of which two sides are parallel and horizontal and the other two equally inclined to the horizon. The inclination depends on the nature of the soil. It is least in tenacious earth and greatest in loose soil; but no soil will maintain itself unless the base of the slope exceeds its height at least in the ratio of four to three. In loose soil the base requires to be twice as great as the height. A canal is usually confined between a bank on one side and a towing-path on the other. The bed of a canal must be absolutely level, or have no more slope than is necessary to convey water to replace that which has been wasted. Hence, when a canal intersects a sloping country in a series of channels at different levels, means must be provided to enable vessels to pass from one level to another. This is commonly effected by means of a lock (which see). See Canals, Interoceanic.

Canal-boat. A large boat generally decked and towed by horses.

Canals, Interoceanic. The Suez Canal is the only one completed or even under construction. Those proposed and based on surveys sufficient to establish their practicability are *via* Nicaragua and *via* Panama, to connect the waters of the Atlantic and Pacific Oceans.

The Suez Canal is a little over 99 miles in length, connecting Port Said on the Mediterranean and Suez on the Red Sea. It follows certain lines of depression known as Lakes Menzaleh, Ballah, Timsah, and the Bitter Lakes, which form a length of about 60 miles. These parts required only partial excavation, leaving 40 miles of canalization through full excavation, and with a summit of only 60 feet above the mean ocean-level.

The aggregate superfice of the lakes named is near 300 miles. Lake Menzaleh lies 6 miles from Port Said, and Ballah 29 miles. The Bitter Lakes are 12 miles from Suez: these natural reservoirs equalize tidal flow and confine any rapid current between the sea and the first natural reservoir. The charts give 6 to 18 inches tidal action at Port Said, and 5 feet at Suez.

The excavation required to obtain a depth of 26 feet was 75,000,000 cubic metres, almost wholly in loose sand and clay. The estimated cost was 162,000,000 francs, and to meet all supposed possible contingencies 200,000,000 was named. The actual capital and indebtedness, January 1, 1879, was very nearly 524,000,000 francs. The draft of vessel allowed is 25 feet; the rates of toll established are 10 francs for each passenger, and 10 francs per ton on measurements designed to represent the net tonnage, to which are added pilotage, towage, and other charges, usually increasing the cost of transit 10 per cent.

In 1877, 1663 vessels, of an average of 2055 tons, passed through; in 1879, 1477 vessels, of an average tonnage of 2190; in 1878, 1593 vessels passed, of which 25 were sailers. The decrease of tonnage between the years named will be observed.

In the Red Sea and the upper Mediterranean heavy short blows are frequent during the winter, and calms prevail in the summer. As a result, in 1876 nearly 60 per cent. of the English vessels trading to India and to Malasia pursued the route by the Cape of Good Hope. The tolls and income of the canal for 1879 were 32,209,493 francs.

The absence of fresh water along the line of the canal was a great discouragement and caused considerable expense until the fresh-water canal from the Nile was completed, and the drifting sands of the desert were partially arrested by vegetation, which became possible through irrigation. The extensive works necessary for the formation of Port Said was the most formidable difficulty encountered, and it is possible of maintenance only by constant dredging, involving large expenditures. The favorable conditions were the almost entire absence of rain-fall, being a mean of an inch and one-third yearly at Cairo, the existence of inconsiderable tides, and the small amount of hard material to excavate. The easy slopes and low grounds, as well as the absence of heavy rain-falls, made the deposition of the excavated material easy; in general, by very powerful dredging-machines, elevating the earth sufficiently to deposit it, through the aid of sluices, where it would be permanent.

The Nicaragua Canal as projected by Commander E. P. Lull, U.S.N.—The proposed canal as located requires the construction of two harbors, one at Greytown, the other at Brito, on the Pacific. In the construction of these harbors a liberal estimate of cost is proposed, but that part is the only uncertain element of cost of the canal; the plans have received the careful examination and approval of able engineers on the estimate of cost as given.

The distance apart of these harbors, following the line as located, is 181¼ miles; the summit-level is Fall Lake, 107.6 feet above mean ocean-level. From Greytown to slack-water navigation of the San Juan River is 42 miles, and estimate of cost $13,390,000. Recent instrumental examinations insure a decrease in distance of 7 miles, with a proportionate decrease in the estimate of cost.

The slack-water navigation begins above the mouth of the San Carlos River, and continues a distance of 63 miles to Lake Nicaragua. As located, four dams are required of a mean height of 29½ feet, and an aggregate length of 3960 feet; the natural foundations are good. Three natural canals around the dams have an aggregate length of 3½ miles. Between a point 6 miles from Greytown and Lake Nicaragua a lockage of 107.6 feet has to be effected. A certain amount of blasting and dredging is proposed in the bed of the San Juan for slack-water navigation. Recent examinations have led to the consideration of making only two dams, and thus reduce subaqueous work and lateral canalization.

The lake navigation extends 56½ miles, and the estimated cost of its improvement is $715,660.

The distance from Virgin Bay to the Pacific is 16⅝ miles by the Rio del Medio route. Recent investigations assure the diversion of the head-waters of the Rio Grande into the lake, thus securing a satisfactory surface-drainage and a

cutting of only 43 feet above the lake by the Lajas route. The descent involves 10 locks, as now proposed, of equal lift, and a tide-lock at Brito, where the spring-tides are 8 feet.

Summarized, the actual canalization required is 52 miles; slack-water navigation on the river San Juan, 63 miles; lake navigation, unimpeded except as above stated, 56½ miles; cost as located, \$52,577,718; with 25 per cent. contingent, \$65,722,147. The improved location reduces estimate for labor \$7,000,000.

The mean annual rain-fall, with not very extended observations, is 83 inches, with a dry season extending from December to April. The probable time required to construct the canal is five years. Excellent stone, lime, and cement, as well as timber, are in abundance and convenient. Lake Nicaragua has a superfice of 2800 miles, and an outflow twenty times as great as could be required for lockage. The trade-winds extend to the ports almost without interruption, making the proposed canal easy for the passage of sailing-vessels.

To such persons as have given little attention to an American interoceanic ship-canal, an inspection of a globe will at once show its importance to the inhabitants of the northern hemisphere, and at the same time the advantage that will be derived through being able to pursue routes in belts of prevailing fair winds by making slight detours for the purpose.

The Panama Route as developed by the surveys of Commander E. P. Lull, U.S.N.—The proposed route as located extends from Aspinwall to Panama, a distance of 41¾ miles. The canal has a summit-level of 124 feet, and derives its water-supply from the upper Chagres, crossing that river at summit-level by means of an aqueduct 1900 feet in length. The height at which the canal should cross the Chagres was determined as a necessity to avoid extraordinary floods, but this height appears to be four feet less than would be found necessary to secure the safety of the aqueduct from such floods as those of November, 1879.*

The proposed feeder is 10¼ miles in length, and, with dam and appliances, the estimated cost is \$10,366,899. At the time of locating the canal the water-supply was supposed to be unusually low, but still entirely sufficient for purposes of lockage. In March, 1878 and 1880, the water-supply was inadequate.

As planned there are 24 lift-locks of 10½ feet each, and a tide-lock at Panama, where the tides reach 22 feet. At Aspinwall the tide is nominal.

The estimated cost for labor and material, made on a common basis for the Nicaragua Canal, is \$75,609,108, and with 25 per cent. contingent, \$94,511,360. Commander Lull remarks the absence of all material for construction except timber.

The average yearly rain-fall is 124 inches. In 1872 it was 170 inches. The dry season extends usually from January to about the middle of April.

The Panama Canal à niveau of M. de Lesseps.—Accompanying a "circular" addressed by M. de Lesseps to American bankers is a "Report of the International Technical Commission appointed to examine the definite work required for the construction of the Panama Canal." This title is, perhaps, given from the fact that the engineers employed by M. de Lesseps were of different nationalities. The report is dated Panama, February 14, 1880, and in substance is as follows:

1. On the line of levels of the Panama railroad, as a base, 58 cross-sections have been taken. Several curves of 2000 metres radius have been adopted.

2. Fifteen borings had been taken on the line of the canal and on the line of the proposed dam at Gamboa; these borings were from a depth of from 12 to 22 metres.

3. It has been determined to adopt a slope of 1 to 1, except in the summit division in rock, where ¼ to 1 is considered sufficient.

4. It is proposed to overcome the difficulties presented by the river Chagres by the construction of a dam at Gamboa, situated between Matachin and Cruces. "The commission expresses the opinion that a dam 40 metres in height would provide for the storage of a volume of water of one thousand millions of cubic metres, a quantity equal to the maximum estimate of the flood of November 25, 1879 (the greatest that has ever been recorded), as given by Colonel G. M. Totten. This work will be completed by the construction of a new channel for the regulated flow of the river from the Gamboa dam to the sea. Another similar but narrower channel will be provided on the opposite side of the canal, for the stream and drainage on that side."

5. The commission deems it necessary to provide at Panama a tide-lock at the outlet, so as to preserve a constant level in the canal, and on the Atlantic side, at Limon Bay, a breakwater 2 kilometres (6561 feet) in length.

6. The estimate of amount of excavation is as follows: in earth, 12,005,000; hard soil, 300,000; hard rocks, 6,786,000; a total of 19,091,000 cubic metres. For above water: earth, 27,350,000; soft rock, 825,000; hard rock, 27,734,000; making a grand total of 75,000,000 cubic metres.

The estimate for excavation of rock above water is given at 2½ francs; for rocks of mean hardness, 7; for hard rocks, 12; for excavation of rock where pumping is required, 18 francs.

For dredging and excavation under water: mud, 2½ francs; hard soil, 12; excavation of rocks, 35 francs per cubic metre.

The proposed dam at Gamboa has a length of 1600 metres (5249 feet), with a height of 40 metres (131 feet), exclusive of foundation. The cost is set down in a round sum of 100,000,000 francs.

The lateral canals for the purpose of securing surface-drainage are also set down for a round sum of 75,000,000 francs, the tide-lock at Panama at 12,000,000, and the breakwater in Limon Bay at 10,000,000, which, with a contingent of 10 per cent., makes a grand total of 843,000,000 francs, which the commission states was "the cost of the work at the prices fixed by the Paris congress for the various items."

M. de Lesseps gives further information to the Board of Trade of San Francisco. Length of canal, 45 miles, with a cutting through an elevation of 90 metres (295 feet) above ocean-level for a distance of three-fifths of a mile. He estimates the time necessary for construction at

* On page 7 of Commander Lull's report will be found his instructions, and the reasons for the proposed height of lockage and objections to a sea-level canal by that route.

six years, and proposes a depth of water below the sea-level of 27 feet.

It is apparent that the capacity of the proposed reservoir, the strength of the dam, and the sufficiency of the proposed lateral canals, as well as their strength of embankment, are of the utmost importance to the security of the work.

The prevalence of calms in Panama Bay and its approaches appears on all weather-charts, and has been especially remarked by Capt. Bedford Pine, of the British navy, and also by Commander Maury, formerly of our navy, who regards this fact as making that locality totally unfit for the construction of a canal.

length varies from 32 to 81 miles; depth of cutting, 50 to 80 feet; sea-level, with two tide-locks; estimated cost, from $8,000,000 to $41,000,000, according to route.

6th. From Cape Cod Bay to Buzzard's Bay. Length, about 18 miles; proposed by a company incorporated by the State of Massachusetts; estimated cost, $4,000,000.

7th. From the Atlantic Ocean to Appalachicola Bay, across Florida (with locks). Proposed and surveyed by the U. S. government; length, 168.5 miles; summit, 203 feet; estimated cost, $50,278,746.

8th. Between Caspian and Black Seas *via* Sea

*Existing Ship-Canals.**

Name of Canal.	Where Situated.	Connecting what Waters or Localities.	By whom Designed.	Length—Miles.	Height of Summit—Feet.	Number of Locks.	Passes Vessels of Draft—Feet.	Cost—Dollars.	When Opened or to be Opened.	Remarks.

* Includes the new St. Mary's Falls, Welland and St. Lawrence enlargement, none of which are quite completed.
† Does not include river and lake navigation.
‡ The cost of canals up to date of confederation, in 1867.
‖ Includes upwards of $8,000,000 expended in improvements and enlargement from 1867 to 1877.

Proposed Ship-Canals.—1st. From Bay of Campeachy to Gulf of Tehuantepec, in Mexico (with locks). Proposed by private capitalists; surveyed by U. S. government; length, 144 miles; summit, 650 feet; estimate of cost not given.

2d. From Caribbean Sea to Pacific Ocean, in Nicaragua (see above description).

3d. From Bay of San Blas to Bay of Panama, in U. S. of Colombia (at sea-level). Proposed by private individuals; surveyed by order of U. S. government; length, 30 to 33 miles; height of summit, unknown; estimated cost by Paris Canal Congress, $280,000,000; tunnel, 7 to 10 miles long.

4th. From Bay of Limon to Bay of Panama, in U. S. of Colombia (see text).

5th. From Chesapeake to Delaware Bays, in Maryland and Delaware. Several routes proposed; surveyed by the U. S. government;

of Azof, in Russia. Proposed by the Russian government. The summit, or divide, is stated to be but 23 feet above sea-level. The Caspian is 84 feet below the level of the sea.

9th. Between the Baltic and North Seas, in Germany (with locks). Proposed by the imperial government of Germany. Connects the mouth of the Elbe and the port of Kiel. Distance, about 45 miles; estimated cost, $18,750,000.

10th. From the Mediterranean to the North Sea, in France. Proposed by Capt. Salicis, of the French navy; length, 1071 miles; summit, 935 feet; no locks, except at the sea.

11th. From the Gulf of Finland, near Cronstadt, to St. Petersburg, in Russia (at the sea-level). Now under construction by the government. Length, 16.4 miles; designed to be extended in a reduced size to the White Sea.

12th. From the Gulf of Manaar to the Palk Strait, in India (at the sea-level). Proposed

by the government; length, about 3 miles; estimated cost, $2,200,000.

13th. From East River, New York Harbor, to the Hudson, *via* Hudson River (sea-level). To be constructed by the government. Length, about 6 miles; estimated cost by Gen. Newton, $2,100,000.—*Daniel Ammen, Rear-Admiral U.S.N.*

Can-body. An old term for a can-buoy.

Can-buoy. A buoy in the form of a cone; they are floated over sands and other obstructions in navigation as marks to be avoided. See BUOYS.

Cancer, Constellation of (Lat. *Cancer*, "The Crab"). The fourth constellation of the ancient zodiac, lying between Gemini and Leo. There is no star in it above the fourth magnitude.

CANCER, SIGN OF. The fourth division of the ecliptic, including from 90° to 120° of longitude. Owing to the precession of the equinoxes, the *constellation* Cancer is no longer in the *sign* of the name, the constellation Gemini having taken its place. The sun is in Cancer from about June 21 to about July 22. Symbol ♋.

CANCER, TROPIC OF. That parallel in the northern hemisphere whose latitude is equal to the sun's greatest declination, about 23° 28′.

Candle. Candles which are used for the battle-lanterns are kept primed. The magazine lantern is fitted to burn candles made of hard spermaceti or wax; those of paraffine, or such as have tallow in them, are prohibited, and all candles are thoroughly examined and tested. When candles are used for side lights they should be of sufficient size to burn from sunset to sunrise, and to be visible on a dark night, with a clear atmosphere, at a distance of at least two miles.

CANDLE-BARK. A cylindrical tin for candles.

Cane. The rattan (*Calamus rudentum*) is sometimes used for standing rigging and cables. The cables remain in the water a long time without decaying or becoming injured by the teredo. They are very hard and difficult to cut, and are therefore used to connect logs as booms to stop the navigation of rivers. See CANEVAS.

Canes Venatici (Lat. "The Hunting Dogs"). A constellation between Ursa Major and Boötes. The principal star is marked 12 *Canum Venaticorum*, named also *Cor Cároli*, and may be found by drawing a line from Dubhe, the star of the Great Bear nearest the pole, to the opposite star of the square of that constellation, and producing it to nearly twice the distance.

Canevas. An old word for hemp canvas, but many races in the East make sails entirely of cane.

Can-hooks. Hooks used to sling a cask by the chimes.

Canis Major (Lat. "The Greater Dog"). A constellation to the S.E. of Orion, containing the brightest star in the heavens, *a Canis Majoris*, the Dog Star; it can be found by continuing the line of the belt of Orion to about three times its length.

Canis Minor (Lat. "The Lesser Dog"). A constellation to the E. of Orion, containing a bright star, *a Canis Minoris*, called also *Prócyon*. It can be found by continuing a line through the two upper stars of Orion to about twice its length.

Canister. A tin or sheet-iron cylinder filled with cast-iron shot, and closed at the ends by blocks of wood; the larger sizes are strengthened by a spindle running through and connecting the ends, having a nut and handle fixed to the upper part. The interstices are filled with dry sawdust to give greater solidity to the mass, and to prevent the balls from crowding when the piece is fired.

Cannon. A military engine for projecting shot, shell, etc., by the force of gunpowder. Cannons are classified as guns, howitzers, and mortars (which see). See ORDNANCE.

CANNONADE. The opening and continuance of the fire of artillery upon any object.

CANNON-PERER. An ancient piece of ordnance in ships of war for throwing stone shot.

CANNON-PETRONEL. A piece of ordnance with a 6-inch bore which carried a 24-pound shot.

CANNON-ROYAL. A 60-pounder of 8½-inch bore.

CANNON-SERPENTINE. An old name for a gun of 7 inches bore.

Canoe. A light narrow boat which is impelled by paddles used vertically, and sometimes fitted with a sail. It is formed of a tree hollowed out by hewing or burning, or of a light frame-work covered with bark or hides. Canoes are also made of iron, paper, and caoutchouc. See ROB ROY.

The Fejee Islanders use a double canoe, which is fitted with an enormous sail. The two canoes are several yards apart, but a deck extends over and is firmly secured to both. See FLYING PROA.

Canopus. The name of the star *a Argûs*.

Canopy. A light awning over the stern-sheets of a boat. The brass frame-work over a hatch.

Cant. The term used to express the position of a piece of timber which does not stand square; it is said to be on a cant or diagonal line. A cut made in a whale, to which is made fast the lower block of a purchase for turning the whale over during the operation of flensing. To turn anything so that it does not stand square. To diverge from a central line.

CANT BALLAST. When a ship by a violent lurch throws her ballast over to leeward, where it remains, keeping her from righting, she is said to *cant* or *shift* her ballast.

CANT-BLOCKS. The blocks of the cant-purchase.

CANT-BODY. That part of the plans of the body of a ship, either in the drawings or in the mold-loft, which represents the outlines of the cant-timbers, and also the lines of the bevelings of the timbers.

CANT-FALLS. See SPIKE-TACKLE.

CANT-FRAME.—The name of one of those frames of the ship which do not stand square across the keel, but which have their heads inclined in a diagonal direction, either forward or aft, as may be needed to fill the space between the square frames and the stem forward, or the square frame and the counter-timbers at the after end of the ship.

CANT-HOOK. A lever with a hook, for slueing heavy articles.

CANT-MOLDING. The molding of any one of the frames or the timbers by the use of the cant-molds and the cant-bevels, prepared in the mold-loft, preparatory to the timbers being cut into the required shape by the workmen.

CANT-PURCHASE. A purchase of which the upper block is secured to the mast-head, and the

lower block to the whale, to turn it over during the operation of flensing.

Cant-timber.—The name of any one of the timbers, of which there are several in each cant-frame.

Cantara. A watering-place.

Canteen (Fr. *cantine*). A military term which in the United States is applied only to a tin vessel covered with cloth and furnished with a strap by which it is slung, which is issued to soldiers for carrying water for their personal use on the march or in campaign. In other countries the term, or its equivalent, is used to indicate a small wooden or leathern chest or coffer containing the table equipage and utensils of an officer in campaign; it is also applied to the store of the licensed sutler of a regiment or garrison.

Cantick-quoin. A quoin used in chocking up casks to keep them from working.

Canting-livre. A light piece of ornament at the forward part of a quarter-gallery, also called *console-bracket*.

Cant-line. Gant-line or girt-line (which see).

Canton. A city of China, and the great commercial emporium of the province of Quang-Tong, on the left bank of the Canton or Pearl River, about 80 miles from its mouth in the China Sea. Lat. 23° 6′ 9″ N.; lon. 113° 15′ E. Canton, with its suburbs, occupies the north bank of the river, extending inland nearly to a row of heights commanding it on the north and northeast, but between which and the city is a broken ravine; to the south lies an alluvial plain, formed by the delta of the river. A large part of the population reside on the water, and for four or five miles opposite the city and both above and below the river is crowded with vessels and rafts of all kinds. Pop. 1,500,000.

Cant-rope. See Four-cant.

Cant-spar. A small spar fit for making a small mast, yard, boom, etc.

Canvas. Coarse cloth made of hemp, flax, or cotton. In the navy cotton canvas is used for mess-cloths, tarpaulins, boom-covers, windsails, bags, hammocks, etc. Flax canvas is used for sails, and is woven in *cloths* 24 inches in width, and put up in *bolts* of 40 yards each. Canvas is numbered from 1 to 9, No. 1 being the heaviest. In large vessels numbers 1, 2, 3 are used for storm-staysails, courses, and topsails; 4 and 5 for jib and main topgallant-sails, and the lighter canvas for royals, stun'sails, flying-jib, etc.

It is of the first importance to obtain the best canvas, as the safety of the ship frequently depends on its quality. The warp or chain of Nos. 1, 2, and 3 should be wholly wrought and made of double yarns, and both the warp and shoot or weft yarn ought to be made of long flax, which should be well dressed, properly cleansed, even spun, and well twisted; and all the weft yarns should be fully as strong as the warp yarns.

It has been found that sails made with the seams and selvages running down parallel with their edges are very apt to bag and become worn in the middle from the strain to which they are subjected by the force of the wind. To obviate this, a mode of making sails with the seams and selvages running diagonally was proposed by Admiral Brooking, and a patent was granted to him in 1828. It has also been proposed to weave the canvas with diagonal threads; that is, to place the weft yarns at an oblique angle to the warp yarns. To accomplish this object the loom must be peculiarly constructed, its warp and work-beams must stand at an oblique angle with the sides of the loom, and the batten and slay must hang in a peculiar manner, in order to beat up the weft in lines ranging diagonally with the warp.

Canvas is also a technical term for the sails of a ship. *Under canvas*, under sail; *storm-canvas*, the storm-staysails, trysails, storm-mizzen, double-reefed foresail, close-reefed fore and main topsails, and fore-topmast staysail.

Canvas-back. A species of duck, *Fuligula valisneriana*, deriving its name from the color of the plumage on its back.

Cap. A bit of leather or tarred canvas put over the ends of standing rigging to protect them from the weather. A large thick block of wood having a round and square hole in it, used to confine two masts together when one is erected at the head of the other. The square hole of the lower cap fits over the tenon of the lower mast, and the topmast traverses through the round hole. The topmast is fitted with a cap for the topgallant-mast, and the bowsprit for the jib-boom.

In mechanism, a block or plate of wood or metal, used to confine the adjustable bearings of a journal. It is usually secured by bolts and nuts, or by keys. See Journal.

Generally, a cap is a top-piece used to confine, cover, or protect any portion of a machine or structure.

Cap-block. The upper piece of each pile of building blocks on which the keel is laid.

Cap-scuttle. A scuttle having a ledge or coaming, over which is a top setting closely into a rabbet.

Cap-shore. A supporting spar between the cap and trestle-trees.

Cap-square. A curved plate of metal, so arranged as to be easily removed, used to confine the trunnions of a gun to the carriage.

Capabarre. An old term for misappropriating government stores.

Capacise. A corrupt form of *capsize*.

Capacity. Burden; tonnage; extent of room or space.

Cape. To keep a course. *How does she cape?* How does she lie her course?

Cape. A cape is a neck of land extending some distance into the sea, or into other bodies of water. A high, mountainous cape is called a promontory; a low, sandy cape is called a spit; a very small, sharp cape is called a point. The term headland, or head, may include all these, or indicates a broad cape.

The local names used to designate these headlands have, in many instances, remained on the charts. Point is the term generally used to indicate a cape on the shores of the Baltic and Gulf of Finland. In Prussia, Ort; in Norway and Sweden, Naes, Horn, and Kyn; in Denmark, Naes; in Holland, Hoek; in Scotland, the Shetland and Orkney Islands, Ness and Head; Ru in the Isle of Skye; Butt and Aird in the Hebrides; Point, Nab, Ness, and Head in England and Wales; Head and Foreland in Ireland; Spit in the Caspian and Aral Seas; Ras in North Africa, the Red Sea, Persian Gulf, and coast of Arabia; and Saki in Japan, are common examples of these designations.

In the names of the thousands of capes that fringe the continents and islands of the world, navigators have perpetuated their own names, the names of their vessels, their countries, their cities, their great men, their rulers, and their heroes, while the saints of the calendar are not to be forgotten as long as the many Cape St. Elizabeths, St. Sebastians, St. Anthonys, and many other sanctified names remain. Some headlands are named from the circumstances attending their discovery, as Cape Disappointment, Cape Flattery, and others; some from the day on which they were first seen, as Friday Cape, etc.; others from physical characteristics, as Rojo (Red Cape), Blanco (White Cape), Verd (Green Cape), Sandy Cape, Rocky Point, etc.; others again from the products of sea or shore found near them, as Cape Cod, Lobos (Seal) Point, etc. Many capes are remarkable from the important position they occupy, being prominent landmarks to the mariner, and some even receive their names from this characteristic, as Start Point; and Land's End and Finisterre describe their position by their names. Some headlands attain a prominence from being at the entrance of important bays, rivers, or harbors, where large cities and greater commerce enhance their usefulness. On the more prominent headlands of the world light-houses are placed, and those that are at the entrance of important places have electric, or other lights of a high illuminating power.

The following capes on the coast of the United States have first-order lights:

Capitana. The principal galley in an ancient fleet.

Caplin, or Capelin. A fish of the family *Clupeidæ*, very similar to a smelt, and used for bait for cod-fish on the banks of Newfoundland.

Cap'n. A colloquial abbreviation for captain.

Capon. A jeering term for red herring.

Capote. A storm-coat fitted with a hood, much worn in the Mediterranean.

Cappanus. The worm which adheres to and gnaws the bottom of a ship.

Capped. A ship endeavoring to make her way against head currents is said to be *capped.*

Capricorn, Tropic of. That parallel in the southern hemisphere whose latitude is equal to the sun's greatest declination, about 23° 28′. See Tropics.

Capricornus, Constellation of (Lat. *Capricornus*, "The Goat"). The tenth constellation of the ancient zodiac, lying between Sagittarius and Aquarius. There is no star in it above the third magnitude; α and β may be found by the line joining Lyra and Altair being produced to not quite its own length.

Capricornus, Sign of. The tenth division of the ecliptic, including from 270° to 300° of longitude. In consequence of the precession of the equinoxes, the *constellation* of Capricorn is no longer in the *sign* of this name, the constellation Sagittarius having taken its place. The sun is in Capricorn from about December 21 to about January 20. Symbol ♑.

Name.	No. of Lights.	Lat.	Lon.	Height, in Feet.	Distance Visible, in Miles.	Character and Color.

F. S. Bassett, Lieutenant U.S.A.

Cape Fly-away. A cloud-bank having the appearance of distant land.

Cape-hen. A bird which follows in the wake of a ship rounding the Cape. It is a small kind of albatross. See Molly-mawk.

Cape-pigeon, or Cape-petrel. A sea-bird which follows a ship round the Cape.

Capella (Lat. "The Kid"). The star α *Aurigæ*.

Caper. A vessel used for privateering by the Dutch in the 17th century.

Caper-cornerways. Diagonally.

Capful of Wind. A light puff of wind which speedily dies away.

Capsize. To upset or overturn; as, to capsize a ship.

Capstan. A machine used on shipboard when mechanical power is required for the moving or raising of heavy weights. It involves the principle of the wheel and axle, and is an improvement of the windlass, by which greater compactness and convenience in use are obtained. It also admits of the application of greater power upon the levers or bars.

The capstan has been used from the earliest times as a mechanical power. It was in use by the English, French, and Spanish as early as the 15th

century, and the drum-capstan in nearly its present form was invented by Sir Thomas Moreland in 1661. It consists of an upright cylinder, called the barrel, surmounted by a circular disk called the drum-head, the circumference of which contains sockets for the admission of the capstan-bars or levers by which the capstan is turned.

To the surface of the barrel, and forming a part of it, are attached several upright pieces of wood called whelps, which serve to increase the circumference of the barrel with but slight increase in the weight of the capstan. The outer edges of the whelps being concave, the turns of the rope or messenger *surge* or slip towards the centre of the barrel as it is wound about it by the revolutions of the capstan. The base of the capstan is called the pawl-head, and is similar in size and shape to the drum-head. The pawls are short stout pieces of iron attached at one end to the periphery of the pawl-head. The pawl-rim is a narrow circular part bolted through the deck to the partners, and is of sufficient width to admit the lower end of the pawls as the capstan is turned. By means of the pawls and the cross-pieces or notches in the pawl-rim, the capstan is prevented from turning back when the power is removed from the bars.

The axis of the capstan consists of a vertical iron spindle, attached to one or more decks, and by which the capstan is held firmly in place. The same spindle may serve as the axis of a double capstan, or two capstans on different decks, by which the power of both may be applied to the same object, or they can be detached and used separately.

Previous to the improvements that have been made in capstans, the cable was connected with the capstan by means of a rope called the messenger. Three or four turns of the messenger were placed upon the capstan, one end passed forward on one side of the deck, and returned on the opposite side, and the two ends lashed together, forming an endless rope, the bight of which extended from the capstan to the hawse-hole. The messenger was fastened to the cable by means of nippers, those nearest the capstan being changed to the cable near the hawse-hole as they approached the capstan.

Capstans composed entirely of iron are now in general use, and improvements have been made by which the chain-cable is brought directly to the capstan and the use of the messenger thereby avoided. They are so constructed that the cable passes around the rear of the capstan, and fits into a space between the barrel and pawl-head, in which are placed chain-whelps, which prevent the cable from slipping. After leaving the capstan the cable passes around a vertical friction-roller, which is placed in a socket in the deck, and thence to the chain-locker on the side of the deck to which the cable belongs.

Steam-power has also been applied to this description of capstan on board of steamers, by which means the number of the crew may be reduced.

An increase of power has also been obtained by means of a system of gearing placed inside of the capstan, which connects the barrel with the spindle. By the use of a *lock-bolt* the capstan can be used as a simple purchase, but by removing the bolt the gearing is brought into action, and the power is increased threefold. The barrel of the capstan then turns in a contrary direction to the drum-head.—*E. T. Strong, Lieutenant U.S.N.*

To pawl the capstan, to drop the pawls into their sockets to prevent the capstan from turning back. *To rig the capstan*, to ship and swift in the bars. *To surge the capstan*, to slack the rope wound around the barrel of the capstan to prevent it from riding or fouling. *To walk back the capstan*, to lift the pawls and turn the capstan in the opposite direction.

CAPSTAN-BAR. A long lever to give an increase of power in heaving at the capstan.

CAPSTAN-BARRING. A sea-punishment, in which the offender was sentenced to carry a capstan-bar during the watch.

CAPSTAN-BAR PIN. A pin sometimes inserted on the end of a capstan-bar to prevent it from unshipping.

CAPSTAN-STEP. The steady, measured tread of the men while heaving at the capstan.

Captain. A name given to the crooner, crowner, or gray gurnard (*Trigla gurnardus*).

Captain. This almost universal term of command is supposed to have originated in the naval service from "*caput*," the head or chief, and "*thane*," a Saxon title of honor, which by statute of King Athelstan was conferred on any merchant who had been thrice across the high seas upon his own account.

Post-captain was a term frequently used in the Royal navy and the U. S. navy to distinguish captains commanding frigates, from master-commandants or commanders the next in rank, commanding vessels of a smaller size, who in common conversation were and are called "captain." There never was such a commission as "post-captain" in either service.

In the British navy, in 1747, when the rank of captain was first clearly defined, those captains who commanded post-ships, or what are now called rated ships, in the Royal navy took rank, if of three years' standing, with army colonels, and until the year 1824 the Royal Navy List described them as *post-captains*. The prefix "post" then disappeared without any order in council or warrant being issued.

Until 1862 captain was the highest commissioned rank in the U. S. navy, and ranked with, according to seniority or duty, a lieutenant-colonel, colonel, or brigadier-general. Under the present organization of the U. S. navy a captain has assimilated rank with a colonel in the army.—*G. H. Preble, Rear-Admiral U.S.N.*

A captain commands a vessel of the second class, or a vessel of the first class under an admiral, vice- or rear-admiral, or a commodore; may be employed as aid to any grade of admiral; as chief of staff to a naval force or detached division, commanded by a rear-admiral or commodore; on duty under a bureau; act as second in command of shore-stations, and may command small practice or flying squadrons. See COMMANDING OFFICER.

The name is also given to certain leading men in the ship's company; as, captain of a gun, captains of tops, forecastle, afterguard, hold, etc.

Captain is also the popular title of the master of a merchant vessel.

Captain of Navy-yard. The line-officer next in rank to the commandant of the yard; he com-

mands during the temporary absence of the commandant, but has no authority to change the established routine. He has special charge of the police and the enforcement of police regulations; of all the fires and lights in the workshops, and, after working hours, he will satisfy himself that there is no danger of fire through the night; of keeping the walks and grounds clean and in good condition; of the berthing, moving, and mooring vessels, and of the fire- and other tugs. The captain of the yard directs the fire department, and he frequently examines the engines and all apparatus for subduing fires, reports at once any deficiencies, and once a month at least, in writing, their actual condition. He causes to be scrutinized all articles and packages passing into or out of the yard; all suspected articles are stopped and examined, when, if found to be of an improper character, they are detained, and a report made to the commandant. Each morning all passes presented at the gate during the preceding day are delivered to the captain of the yard for inspection and report. He has no direct authority or control of the affairs of the yard by virtue of his own rank or position, but it is his duty to convey to the heads of the departments of the yard such orders as the commandant desires to transmit verbally; and it is also his duty to visit and observe all parts of the navy-yard and its establishments, and to make such reports as will enable the commandant to be fully informed as to the harmonious working of the various parts of the station under his command. A regular journal is kept under his direction, which he is to sign daily and submit monthly to the commandant for his approval. In it must be entered the time when all officers report for duty at, or are detached from, the yard, when any vessel is received for repairs or put in commission, the number of mechanics and others employed, the arrival and departure of all vessels of war and of vessels with stores of any kind for the yard, the time when any vessel is taken into or removed from the dock, the state of the wind and weather, as well as the barometer and thermometer, and the other principal transactions of the yard.

Captain's Cloak (*Eng.*). The jocose name given to the thirty-sixth article of war: "All other crimes not capital, and for which no punishment is hereby directed to be inflicted, shall be punished according to the laws and customs in such cases used at sea."

Captive. A prisoner taken by force or stratagem in war by an enemy. Kept in bondage or confinement.

Captor. One who takes a prisoner, prize, or place in war. See INTERNATIONAL LAW, PRIZE.

Capture. The act of taking. To take a prisoner, prize, or place in war. The thing taken. See INTERNATIONAL LAW, PRIZE.

Carack, Carrak, or Carrick. A large ship of burden, the same with those called galleons. Hippus, the Tyrian, is said to have first devised caracks, and onerary vessels of prodigious bulk for traffic or offense. See CARRAC.

Caracora. A proa of Borneo, Ternate, and the Eastern Isles; also called caracol by early voyagers.

Caramoussal. A Turkish merchant ship with a pink-stern.

Caravel, or Caravela. A Portuguese dispatch-boat, lateen-rigged, formerly in use; it had square-sails only on the foremast, though dignified as a caravela.

Caravelao. A light pink-sterned vessel of the Azores.

Carbasse. See KARBATZ.

Carbin. A name for the basking shark (which see).

Carcass. A shell for incendiary purposes, filled with a very fiercely flaming composition of saltpetre, sulphur, resin, turpentine, antimony, and tallow. It has three vents for the flame, and sometimes is equipped with pistol-barrels, so fitted in its interior as to discharge their bullets at various times. The ribs, keel, stem, and stern-post of a ship after the planks are stripped off.

Carcatus (from *caricato*, It.). A law-term for a freighted ship.

Card. The dial or face of the magnetic compass,—probably derived from *cardinal*.

Cardinal (Lat. *cardinalis*, literally pertaining to a hinge, *cardo*, hence that on which other things turn, principal). The points to which, as regards position and motions, others are referred. Thus we have "the Cardinal Points of the Compass," "the Cardinal Points of the Horizon," "the Cardinal Points of the Ecliptic."

CARDINAL POINTS OF THE COMPASS. The same as the cardinal points of the horizon, but with reference to the direction of the magnetic needle. They are named *North*, *South*, *East*, and *West*; the most important of which is the North.

CARDINAL POINTS OF THE HORIZON. The four cardinal points of the horizon are the *North* (N.), *South* (S.), *East* (E.), and *West* (W.). The north and south points are where the meridian intersects the horizon, and they are the poles of the prime vertical; the east and west points are where the prime vertical intersects the horizon, and are the poles of the meridian. The north and south points are those from which the horizontal distance from the meridian of all bodies having an altitude is measured; the east point is that to which their rising, and the west point that to which their setting, is referred.

CARDINAL POINTS OF THE ECLIPTIC. The four cardinal points of the ecliptic are the two points of its intersection with the equinoctial, called the *Equinoctial Points*; and the two points where it attains its greatest distance from the equinoctial, called the *Solstitial Points*. With reference to the seasons of the northern hemisphere, these are named the *Vernal* and *Autumnal Equinoctial Points*, and the *Summer* and *Winter Solstitial Points*. These are more commonly called after the signs of the ecliptic in which they are severally situated: the *First Point of Aries* (symbol ♈) and the *First Point of Libra* (♎), the *First Point of Cancer* (♋) and the *First Point of Capricorn* (♑). The Colures intersect the ecliptic in these four points. The most important of them is the First Point of Aries, as from it right ascensions and longitudes are reckoned. The sun is in ♈ about March 21, in ♋ about June 21, in ♎ about September 21, and in ♑ about December 21.

CARDINAL WINDS. Winds from due north, south, east, or west.

Careen. A ship is said to careen when she inclines to one side, or lies over when sailing on a wind; off her keel or carina.

To careen a vessel is to heave her down preparatory to cleaning or repairing her bottom. See HEAVING DOWN.

Carey. See MOTHER CAREY'S CHICKENS.

Cargo. The merchandise with which a ship is freighted.

CARGO-JACK. A jack used on its side in stowing cargo, for forcing heavy articles into place.

CARGO-PORT. The aperture through which the cargo of a vessel is loaded and discharged. A timber-port is in the bows of the vessel.

Caricatore. Places where the traders of Sicily take in their goods, from *caricare*, to load.

Carina. An old term, from the Latin, for the keel or a ship's bottom.

Carl, or Male-hemp. See FIMBLE, or FIMBLE-HEMP.

Carle-crab. The male of the black-clawed crab, *Cancer pagurus;* also of the partan, or common crab.

Carline, or Carling. A short timber ranging fore-and-aft from one deck-beam to another.

CARLINE-KNEE. A knee in the deck-framing, which is placed against a carline.

Carn-tangle. A long and large fucus, thrown on beaches after a gale of wind in the offing.

Carous. A sort of gallery in ancient ships, which turned on a pivot. It was hoisted to a given height by tackles, and thus brought to project over, or into, the vessel of an adversary, furnishing a bridge for boarding.

Carp. A well-known fresh-water fish of the *Cyprinidæ* family, a native of Persia, considered to have been introduced into England in the time of Henry VIII.; but in Dame Berner's book on angling, published in 1486, it is described as the "daynteous fysshe" in England.

Carpenter. A warrant-officer whose duty is to see that the hull, masts, and spars of the ship are kept in good repair, and to point out any and all defects in either to his commanding officer. It is his duty also, with the men under him, to take charge of the pumps, and to stop shot-holes in time of action. *Carpenter* is also the rating of one of the mechanics belonging to the carpenter's gang.

CARPENTER'S CREW, or GANG. The mechanics of the ship not belonging to the engineer's department; as, the carpenter's mate, cooper, etc.

CARPENTER, SHIP-. A builder of ships.

Carrac, Carraca, Carrack, or Carricke. A name given by the Spaniards and Portuguese to the vessels they sent to Brazil and the East Indies; large, round built, and fitted for fight as well as burden. Their capacity lay in their depth, which was extraordinary. English vessels of size and value were sometimes also so called. See CARACK.

Carrara. The great northern diver, *Colymbus glacialis.*

Carriage. See GUN-CARRIAGE.

Carrick-bend. A peculiar bend much used for bending two hawsers together.

Carrick-bitts. The bitts which support the ends of a windlass, called also windlass-bitts.

Carronade. A gun, capable of carrying a large ball, and useful in close engagements at sea. It took its name from the large iron-foundry on the banks of the Carron, near Falkirk, in Scotland, where this sort of ordnance was first made, or the principle applied to an improved construction. Shorter and lighter than the common cannon, and having a chamber for the powder like a mortar, they were generally of large calibre, and carried on the upper works, as the poop and forecastle.

Carry. To subdue a ship by boarding; to capture a fort by an assault. To convey or propel; as, a gun *carries* well,—that is, propels the shot to a great distance. To bear or support; as, a ship *carries* canvas, guns, or cargo. *To carry on*, to conduct; as, to *carry on* duty; also to carry sail beyond the limits of prudence. *To carry away*, to break; as, to *carry away* a rope or mast. *To carry the keg*, a smuggler's phrase, meaning to continue. See LASH AND CARRY.

Cartagena. A city and seaport of the United States of Colombia, on a small sandy peninsula, connected with the continent by an artificial neck of land. Lat. 10° 25′ 36″ N.; lon. 75° 34′ W. The bay, which is landlocked and has smooth water, extends from north to south 7 miles, and affords excellent anchorage. There were two entrances to the port,—the Boca Grande, close to the town, and the Boca Chica, farther south. Two strong castles defend Boca Chica, which is the principal entrance. Pop. 9250.

Cartagena. A city and the chief naval arsenal of Spain, on a noble bay of the Mediterranean, 27 miles S.S.E. of Murcia. Lat. 37° 36′ 5″ N.; lon. 0° 56′ 36″ W. Pop. 55,000. Its harbor has been much improved by the construction of moles. An island on the south, as well as the city, is strongly fortified. In its western division are docks for building men-of-war, an arsenal, and a floating-dock. Its port communicates with the Segura River by the Lorca Canal.

Carte Blanche. Authority to act at discretion.

Cartel. In military parlance, an agreement for the exchange of prisoners. Also a challenge to fight a duel. A *cartel-ship* is one commissioned in time of war to convey prisoners for exchange, or to carry proposals of any kind between belligerent powers. She has only one gun for the purpose of firing signals, as the officer who commands her is particularly ordered to carry no cargo, ammunition, or implements of war. Cartel-ships, by trading in any way, are liable to confiscation.

Carter, John C., Commodore U.S.N. Born in Virginia. Appointed from Kentucky; sloop "Lexington," 1827; frigate "Delaware," Mediterranean Squadron, 1829–30; commissioned as lieutenant, 1837; frigate "Macedonian," West India Squadron, 1840; receiving-ship, New York, 1845; steamer "Mississippi," Home Squadron, 1846; navy-yard, Norfolk, 1847–48; frigate "Raritan," Pacific Squadron, 1852–53; rendezvous, New York, 1855; commissioned as commander, 1855; commanding steamer "Michigan," on the Lakes, 1861–64; commissioned as commodore, July 16, 1862; commanding receiving-ship "Vermont," New York, 1865; light-house inspector, 1866–69; died in 1871.

Carter, Samuel P., Commodore U.S.N. Born in Carter County, Tennessee. Appointed from Tennessee, February 14, 1840; promoted to passed midshipman, July 11, 1846; "Ohio," 74, Home Squadron, 1846–47; present at capture of Vera Cruz; commissioned as lieutenant, April 18, 1855; steam-frigate "San Jacinto," East In-

dia Squadron, 1855–57; at attack on Barrier Forts, Canton River, China, 1856; Naval Academy, 1857–60; steam-sloop "Seminole," Brazil Squadron, 1860–61; returned to the United States, July 6, 1861; July 11, 1861, Lieutenant Carter was ordered to report to the Secretary of War for special duty; was instructed to proceed to East Tennessee and raise troops; organized the Tennessee Brigade, and was assigned to command in September, 1861, with acting appointment of brigadier-general; present at Wild Cat, Kentucky, at Zollicoffer's repulse, October, 1861; at battle of Mill Springs, January, 1862; commanded in Southeastern Kentucky from February, 1862, to April, 1862; and in operations against Cumberland Gap, March and May, 1862; commissioned brigadier-general May 1, 1862; at capture of Cumberland Gap, June 17, 1862; in Kanawha Valley in October and November, 1862, at which time the rebel troops were driven out and the valley re-occupied by Union forces. Commanded cavalry expedition into East Tennessee, tore up track and destroyed bridges on East Tennessee and Virginia Railroad, and in several engagements, at Holston, Carter's Station, and Jonesville, defeated rebel troops in December, 1862, and January, 1863. This cavalry raid, which was the first of any importance made by Union troops into rebel territory, was attended with valuable results, not only from amount of damage done the rebel cause from destruction of property, loss of troops, and the breaking of their principal line of railway, but from the relief it afforded Gen. Rosecrans when pressed at Murfreesboro', and the new life it infused throughout all our cavalry commands. For this successful raid received thanks of the general-in-chief of the army in general orders; also of the commander of the Department of the Ohio, in general orders, and the commander of the district of Kentucky; was recommended by latter two for promotion to major-general; was assigned to command of division of Central Kentucky in March, 1863; at battle of Dutton's Hill, March 31, 1863; commanded in Southeastern Kentucky, headquarters at Somerset, from May to July, 1863; defeated Pegram's forces at Monticello and Beaver Dam in May and June, 1863, and Morgan at West's; was thanked, in general orders, by the commander of the Department of the Ohio. In July, 1863, was assigned to command of cavalry division, 23d Army Corps, and had the advance when Burnside occupied East Tennessee, in August and September, 1863; defeated Morgan's forces, near Emory, August 28, 1863, and Smith's, at Loudon, August 29; present at siege and battle of Knoxville, November and December, 1863; provost-marshal-general of East Tennessee, September, 1863, to January, 1865, when he was relieved at his own request, ordered to North Carolina, and assigned to command of division of the district of Newbern; commanded the left wing at battle of Kinston (Wise's Fork), N. C., on March 10, 1865, where Bragg was defeated; occupied Goldsboro', N. C., March 20, 1865, driving out the rebels with his command; was in command of the place during its occupancy by the armies of Gen. Sherman; assigned to command of 3d Division, 23d Army Corps, April 7, 1865; brevetted major-general, March 13, 1865; was in command of Western North Carolina from May, 1865, and of 23d Army Corps from July until relieved from duty in that State in August, 1865; honorably mustered out of the army January, 1866.

Commissioned as lieutenant-commander, July 16, 1862.

Commissioned as commander, June 23, 1865; commanding steamer "Monocacy," Asiatic Squadron, 1866–69; Naval Academy, as commandant of midshipmen, 1869–72.

Commissioned as captain, October 28, 1870; commanding steam-sloop "Alaska," European Station, 1872–75; member light-house board, 1876–80.

Commissioned as commodore in 1878.

Carthoun. The ancient cannon royal, carrying a 66-pound ball, with a point-blank range of 185 paces, and an extreme one of about 2000. It was 12 feet long and of 8½ inches diameter of bore.

Cartouch. A paper case containing a charge for a fire-arm. A case filled with shot to be fired from a cannon.

Cartridge. A case of paper, flannel, or sheet-metal to contain a charge of powder for a fire-arm. For muzzle-loading small-arms the powder and ball are inclosed in paper; for breech-loading small-arms the powder and ball are enveloped in a sheet-metal case, which also contains the fulminate for igniting the charge.

The cartridges for great guns, howitzers, and mortars are put up in bags made of serge cloth, woven expressly for this purpose, being entirely of wool and of a close uniform texture. It is manufactured in pieces of 29 yards in length, and from 16 to 36 inches in width. Rattinet, merino, bombazette, or silk cloth can be used if impossible to obtain the serge cartridge-cloth. Cartridge-bags are made of two shapes, conical and cylindrical, and are sewed with worsted yarn. They are white, and when filled are tied with woolen thrums, and are stenciled in black, with the calibre of gun and weight of charge. The cartridge-bags of the smooth-bore howitzers are fitted with a brass wire ring for the purpose of attaching them to the sabot of the projectile; when so attached the cartridge and projectile are called a round of fixed ammunition.

CARTRIDGE, BALL-. A cartridge for small-arms which contains a projectile.

CARTRIDGE-BOX. A small box made of harness leather, worn on the waist-belt, to contain cartridges for a pistol or rifle. See PASSING-BOX.

CARTRIDGE, BLANK. A cartridge which does not contain a projectile. It is used only for firing salutes or making signals.

CARTRIDGE, DUMMY. A block of wood of the size and shape of a ball-cartridge, for use in exercise to accustom the men to the handling of cartridges.

CARTRIDGE, METALLIC. The metallic cartridges used in the navy are central primed, and are purchased as required from private manufacturers. The same calibre is used for pistols, rifles, and machine-guns. The bullet is cylindro-conical in shape, having three rings and a concave base.

Caruel. See CARVEL.

Carved Work. The ornaments of a ship which are wrought by the carver.

Carvel. A light lateen-rigged vessel of small

burden, formerly used by the Spaniards and Portuguese. Also, a coarse sea-blubber, on which turtles are said to feed.

Carvel-built. A term to signify that the planks of a boat meet, and do not overlap as in a *clinker-built* boat.

CARVEL-JOINT. A flush joint.

Cascabel. The part of a gun abaft the base of the breech.

CASCABEL-BLOCK. The mass of iron which fits in between the jaws of the cascabel. It is removed to admit the bight of the breeching.

CASCABEL, JAWS OF THE. That part of a cascabel abaft the breeching-hole.

CASCABEL-PIN. An iron pin to secure the cascabel-block in the jaws of the cascabel.

Casco. A rubbish-lighter of the Philippine Islands.

Case. The outside planking of the ship.

Case, Augustus Ludlow, Rear-Admiral U.S.N. Born in Newburgh, N. Y., February 3, 1813. Appointed midshipman April 1, 1828; first order, July, 1828, to receiving-ship "Robert Fulton," New York; first cruise in frigate "Hudson," Brazil Squadron, 1828–31; navy-yard, New York, 1832; cruise in sloop-of-war "St. Louis," West Indies, 1832–33; New York Navy-Yard and School, 1833–34.

Promoted to passed midshipman, June 14, 1834; navy-yard, New York, 1835; schooner "Experiment," coast survey, 1836; bark "Pioneer," U. S. South Sea Surveying and Exploring Expedition, 1837.

Commissioned as "lieutenant while on duty in the exploring expedition," June, 1838; store-ship "Relief," exploring expedition, 1838; sloop-of-war "Vincennes," exploring expedition, 1839–42.

Commissioned as lieutenant, February 25, 1841; cruise in frigate "Brandywine," East Indies, 1843–45. During Mexican war: In schooner "Mahonese," brig "Porpoise," frigate "Raritan," sloops-of-war "John Adams" and "Germantown," Gulf of Mexico, 1846–48. He was present at and participated in the capture of Vera Cruz, Alvarado, and Tabasco. After the landing of the troops on the first day, was in charge of the beach and superintended the landing of men, ordnance, and stores for the investment of Vera Cruz. After possession of Laguna was taken by the "Porpoise," he was dispatched, in a "bungo" having one of the "Porpoise's" 42-pounder carronades mounted on the bow, with Passed Midshipman F. K. Murray and 25 men, up the Palisada River to the town of the same name, which was captured and held for a fortnight against a large body of cavalry which almost daily threatened an attack. The object of holding the town was to intercept and capture Gen. Santa Anna, who, it was supposed, would endeavor to escape to Honduras, *via* the Palisada passes. Cruising in sloop-of-war "Vincennes," Pacific Ocean, 1849–51; commanding sloop-of-war "Warren," Pacific Squadron, 1852–53; light-house inspector, third district, New York, 1853–57.

Commissioned as commander, September 14, 1855; waiting orders in 1858; commanding steamer "Caledonia," Brazil Squadron and Paraguay Expedition, in 1859; waiting orders in 1860. During the Rebellion: In March, 1861, just at the commencement of the Rebellion, Commander Case was ordered to Washington as assistant to (then) Commodore Stringham, in the Office of Detail; but on the assignment of the latter to the command of the North Atlantic Blockading Squadron, he was appointed fleet-captain of it, and with him joined the steam-frigate "Minnesota," at Boston, April 13. Subsequently, served in the same position with Flag-Officer L. M. Goldsborough and Acting Rear-Admiral S. P. Lee, who were successively appointed to command the fleet, 1861–62. He took part in the capture of Forts Clarke and Hatteras, August 28 and 29, 1861; Roanoke Island, February 7 and 8, 1862; Sewell's Point (where, in passing the heavy fortifications on Craney Island, he landed from his "tug" and hauled down the large rebel flag there flying) and Norfolk, May 10, 1862; and all of the general active operations of the North Atlantic Fleet, until January, 1863, when, it being understood that active operations were over, and that the duty of the fleet would be mostly confined to blockading, he was assigned to the command of the steam-sloop "Iroquois," which was fitted to look after the "Alabama," but was afterward attached to the North Atlantic Squadron. In charge of the blockade of New Inlet, N. C., 1863; cut out the steamer "Kate" from under Fort Fisher and the other batteries at New Inlet, aided by the steamers "James Adger" and "Mount Vernon," in August, 1863.

Commissioned as captain, January 2, 1863; special duty, Washington, in 1864; navy-yard, New York, 1864–65; fleet-captain, European Squadron, 1865–66.

Commissioned as commodore, December 8, 1867; light-house inspector, third district, New York, 1867–69.

Chief of Bureau of Ordnance, 1869–73.

Commissioned as rear-admiral, May 24, 1872; commanding European Squadron, 1873–75, and combined European North and South Atlantic Fleets, assembled at Key West, Fla., 1874, for special service in connection with the steamer "Virginius" difficulties, and for ordnance, torpedo, and fleet practice and tactics, etc. Total sea service, twenty-four years ten months; shore or other duty, twelve years.

Case-book. A register or journal in which the surgeon records the cases of all the sick and wounded who are placed under medical treatment.

Case-shot. See CANISTER.

CASE-SHOT, SPHERICAL. See SHRAPNEL.

Cash. A Chinese copper coin having a square hole in the centre. It bears on one side the name of the province in which it is cast and the Chinese word money; on the other side are the Chinese words "current money" and the name of the reigning emperor. It is the only native coin, and is called *tsien* by the Chinese and *sapeque* by the French.

Casing. The lining, veneering, or planking over a ship's timbers, especially for the cabin-beams; the sheathing. A bulkhead round a mast to prevent the interference of cargo, or shifting materials.

In steam enginery, a covering applied to boilers, steam pipes, cylinders, etc., to prevent radiation of heat. It is generally composed of hair felt, protected by wood or sheet metal sheathing. Asbestos cement, plaster of Paris,

and empty air-tight spaces are frequently substituted for the felt.

Cask. A strong barrel for containing fluids.

Casket. See GASKET.

Cassava, or Cassada. A species of the genus *Jatropha janipha*, well known to seamen as the cassava bread of the West Indies. Tapioca is produced from the *Jatropha manihot*. Caution is necessary in the use of these roots, as the juice is poisonous.

Cassin, Stephen, Commodore U.S.N. Born in Philadelphia, February 16, 1783; died at Georgetown, D. C., August 29, 1857. Entered the navy as midshipman, February 21, 1800; became lieutenant, February 12, 1807; master, September 11, 1814; captain, March 3, 1825. Served with distinction in the war with Tripoli; commanded the "Ticonderoga," in McDonough's victory on Lake Champlain; was rewarded by Congress with a gold medal for bravery in that action, and was a terror to the pirates who infested the West Indies, and captured four of their vessels, September 28, 29, 1822.

Cassiopeia (named after the mythical wife of Cepheus). A constellation on the opposite side of the pole to the Great Bear, and at about the same distance from it. It consists of a group of stars of the third and fourth magnitude, disposed in a form somewhat resembling a chair. *α Cassiopeia* is, of the six principal stars, the farthest from the pole.

Cast. A term meaning four; applied to herrings, haddocks, etc. The heaving of the lead into the sea to ascertain the depth of water. The act of casting anything in a mold. To force a ship's head off from the wind on getting under way. *Acast*, abox, the position of the head-yards in casting. *To cast off*, to throw off; to let go. *To cast anchor*, to come to anchor,—an expression, however, which is never used in the navy. *To cast up accounts*, to vomit,—the effect of sea-sickness. *To cast loose* a gun is to get it ready for action.

CAST-AWAY. Wrecked.

CAST-AWAYS. The people belonging to a wreck; men who are left behind when a vessel goes to sea.

CAST-OFFS. The citizen's clothing abandoned by sailors on enlisting in the navy.

Cast Knees. The hanging knees which crook or arch over the corners of the gun-ports, riders, etc.

Castle-wright. An artificer employed in the erection of castles in early ships.

Castor. α^2 *Geminorum.*

Castor and Pollux. Fiery balls sometimes seen flickering about the mast-heads and yard-arms during a gale. See ST. ELMO'S FIRE.

Casualty. That which comes without design; an event inevitable and not to be guarded against.

CASUALTIES. A word comprehending all men who die, desert, or are discharged.

Cat. A ship formed on the Norwegian model, usually employed in the coal and timber trade, and generally built remarkably strong. A cat is distinguished by a narrow stern, projecting quarters, a deep waist, and no ornamental figure on the prow. An instrument of punishment formerly used in the navy. (See CAT O' NINE TAILS.) The purchase used to hoist the anchor from the hawse-hole to the cat-head. *To cat* the anchor, to hoist it up to the cat-head and pass the ring-stopper.

CAT-BACK. A line from the cat-block to assist in hooking it to the ring of the anchor.

CAT-BEAM, or BEAK-HEAD BEAM. In former times the forward ends of the ships of war were finished square across the ship at the upper part instead of rounding to the ends as nowadays, and the cat-heads were attached to each end of this beam. The beam was generally made in two breadths, being a very wide beam, and tabled and bolted together; the forward side was placed far enough forward to receive the heads of the stanchions of the beak-head bulkhead.

CAT-BLOCK. A heavy, double, or threefold iron-bound block having a hook fitted with a link; used in catting the anchor.

CAT-HEAD. The timber that projects over the bows, and to which the anchor is hoisted.

CAT-FALL. The rope reeving through the cat-block and sheaves of the cat-head, forming the purchase called the cat.

CAT-STOPPER, or CAT-HEAD STOPPER. The ring-stopper.

CAT-TAIL. The inner end of the cat-head.

Catalan. A small Spanish fishing-boat.

Catamaran. A sort of raft used in the East Indies, Brazils, and elsewhere; those of the island of Ceylon, like those of Madras and other parts of that coast, are formed of three logs secured together by means of three spreaders and cross lashings, through small holes; the centre log is much the largest, with a curved surface at the fore-end, which tends and finishes upwards to a point. The side logs are similar in form, and fitted to the centre log. These floats are navigated with great skill by one or two men, in a kneeling position; they think nothing of passing through the surf which lashes the beach at Madras and at other parts of these coasts, when even the boats of the country could not live upon the waves; they are also propelled out to the shipping at anchor when boats of the best construction and form would be swamped. Their length is from 20 to 25 feet, breadth 2½ to 3½ feet, and the timber preferred for their construction is the *Dup* wood, or *Cherne-Maram*, the pine varnish-tree.

Catanadromi. Migratory fishes, which have their stated times of going from fresh water to salt and returning, as the salmon, etc.

Catania, a city of Sicily, on its east coast, 54 miles by rail N.N.W. of Syracuse. Lat. 37° 28′ 20″ N.; lon. 15° 5′ 15″ E. The harbor is not adequate to the importance of the city, but it is generally full of small craft. It is small, and during a strong sirocco no ship can enter. Pop. 85,000.

Catascopia. Small vessels anciently used for reconnoitring and carrying dispatches.

Cat-boat. A shallow, saucer-like boat drawing little water and fitted with a centre-board. The forward part is decked over, and the mast is stepped close to the stem. It has but one sail, which is extended by a gaff and a long boom. It can be easily handled by one person, and its management is easily learned. Its length varies from 10 to 40 feet, but the greater number are over 15 and under 25 feet in length. It is the typical American sail-boat, the cat-rig being scarcely known in Europe.

Catch. A fisherman's term for the number of fish taken at one time.

Catch a Crab. In rowing, if the oar be immersed too deep in the water the blade is carried aft and the loom thrown forward, thus jamming the oar in the rowlock; the boat's headway must be checked before it can be recovered. This mishap is termed *catching a crab.*

Catch a Turn. To belay, or take a turn quickly.

Catch-fake. An unseemly doubling in a badly coiled rope.

Catenary. The curve formed by a rope hanging freely between two points of suspension.

Caterer. A purveyor and provider of provisions. Each mess of officers selects a caterer from their number, and his duties are to preside at the mess-table and to manage and direct all the affairs of the mess; he keeps an account of the receipts and expenditures, and at the end of the month renders a statement of his accounts.

Cat-fish. The sea-cat or sea-wolf (*Anarrhicas lupus*), often six feet in length. Also a fresh-water fish of the genus *Pimelodus.* The common cat-fish is also called *bull-head* and *horned pout.*

Cat-gut. A term applied to the sea-laces, or *Fucus filum.*

Cat-harpings, or Cat-harpins. Short ropes used to bind in the rigging in the wake of the topsail-yards, that the yard may be braced sharp up.

Cathay. Marco Polo's name for India.

Cathode. Faraday's term for the negative pole of a battery.

Cat-holes. Holes through the quarter through which are passed the hawsers for fasts and springs.

Cat-lap. Tea, or weak drink.

Cat o' Nine Tails. An instrument formerly used for flogging in the navy. It consisted of nine pieces of cord, with three knots in each, fixed on a short piece of thick rope as a handle. With this the offender was flogged on the bare back. See FLOGGING.

Catraia. Portuguese surf- or pilot-boats. They are generally about 56 feet long by 15 feet beam, and are impelled by 16 oars.

Cat-rig. See CAT-BOAT.

Cat's-paw. A light air which slightly ruffles the surface of the sea. Cat's-paws occur during calms, and are transitory in their nature. Superstitious sailors scratch the booms, masts, or backstays to invoke even these cat's-paws, as they are the forerunners of a steady breeze. Cat's-paw is also a name given to a peculiar twisting hitch in the bight of a rope, making two smaller bights, into which a tackle is hooked.

Cat's-skin. The impression made by a cat's-paw on the surface of the sea.

Cattan. A Japanese sword.

Catty. A Chinese commercial weight of 18 ounces. Tea is packed in one or more *catty*-boxes; hence most likely our word *tea-caddy.*

Caudal Fin. The fin terminating the tail of a fish.

Caudicariæ. A kind of lighter used by the Romans on the Tiber.

Caul. The membrane encompassing the heads of some infants when born, and from early antiquity esteemed an omen of good fortune and a preservation against drowning. Also, a name for a dam-dike.

Caulk. See CALK.

Caury. Worm-eaten.

Cavallo, or Carvalhas. A salt-water fish, well known as the bonito, or horse-mackerel.

Cavalot. A gun carrying a ball of one pound.

Caver. A word used in the Hebrides for a gentle breeze.

Caviare. A preparation of the roe of sturgeons and other fish salted. It forms a lucrative branch of commerce in Italy and Russia.

Cavil. A large, square wooden pin fixed in a pin-rail to which are belayed the larger ropes; as, topsail-halliards, yard-ropes, etc. Sometimes the word is applied to a large cleat.

Cavity. The hollow in the water formed by the immersed bottom and sides of a vessel.

Cavo-fungo. A boat or mud-machine used by the Venetians to clean out canals.

Cawe, or Cawfe. A floating cage, in which eels, lobsters, etc., are kept.

Cawker. An old term to signify a glass of spirits taken early in the morning; an eye-opener.

Cay, or Cayos. Small insulated sandy spots or rocks. See KEY.

Cayenne. A town of South America, capital of French Guiana, on the western point of an island of the same name, at the mouth of the Cayenne or Oyaque River, in the Atlantic. Lat. 4° 56′ 5″ N.; lon. 52° 20′ W. The harbor is shallow, has two quays, and is protected by a fort and several batteries. Cayenne is a penal settlement for French political and criminal offenders. Pop. 10,500.

C. B. (*Eng.*). The uncials of Companion of the most honorable order of the Bath. This grade was at one time distributed so profusely that an undecorated veteran testily remarked that if the government went on thus there would soon be more C.B.'s than A.B.'s in the navy.

Cease Firing. The order to stop firing.

Ceiling. Strakes of plank worked between the clamps and water-ways on berth-decks, and between the thick strakes and clamps, and thick strakes and bilge-strakes in the hold.

Celestial (Lat. *cœlestis*, from *cœlum*, the heavens). Pertaining to the heavens; opposed to *terrestrial.* Thus we have the "celestial meridian," the "celestial horizon," the "celestial equator," etc.

CELESTIAL CONCAVE (Lat. *concavus*, hollow). Of the two spherical surfaces with which we are concerned, the terrestrial sphere is *convex,—i.e.*, presents its external surface to us; while the celestial sphere is *concave,—i.e.*, presents its internal surface to us. The different heavenly bodies are interspersed in space at various distances from the earth, but to an observer on its surface all of them appear to be placed or projected on the internal surface of a hollow sphere. This sphere is called the *celestial concave*, *celestial sphere*, *sphere of the heavens*, or *sphere of the stars*, its centre being the position of the observer. It must always be remembered that the celestial concave is an imaginary surface, arising in the mind of the observer either from association with the real concave surface of the retina of his eye, which is the true seat of all visible angular dimensions and angular motion, or from the inability of the eye to perceive differences of distances in objects so remote as the heavenly bodies.

CELESTIAL EMPIRE. A popular designation for China. It is said to be derived from the Chinese words *Tien Chan*, that is, Heavenly Dynasty, meaning the kingdom ruled over by the dynasty appointed by heaven.

Cell. See GALVANIC BATTERY.

Celoces, or Celetes. Light row-boats formerly used in piracy, and also for conveying dispatches.

Centaurus (*Lat.* "The Centaur"). A constellation which, together with Crux, constitutes a bright group in the southern hemisphere, pointed out by the line joining Arcturus and Spica. The two principal stars α^2 and β of the Centaur are close together, β being the nearer to the cross.

Centigrade (Lat. *centum*, a hundred; *gradus*, a step, graduation). See THERMOMETER.

Centime (*Fr.*). The hundredth part of a franc.

Central Eclipse. See ECLIPSE.

Centre. The middle part of anything.

CENTRE-FIRE CARTRIDGE. A metallic cartridge in which the fulminate occupies an axial position.

CENTRE-LINE. The line which is the exact centre of the ship, either in the drawings or upon the ship's hull.

CENTRE OF A FLEET. The division between the van and rear, or between the weather and lee divisions.

CENTRE OF ATTRACTION, or GRAVITATION. The point to which bodies tend by gravity.

CENTRE OF BUOYANCY, OF DISPLACEMENT, OF CAVITY, AND OF IMMERSION. Synonymous terms in naval architecture for the mean centre of that part of a vessel which is immersed in the water.

CENTRE OF EFFORT. A point, to which the whole force of the wind on the sails being applied, the effect produced is the same as that caused by the wind when uniformly distributed on the system of sails.

CENTRE OF GRAVITY. That point of a body about which all the parts exactly balance each other, so that if it be supported the whole body will be at rest in any position whatever.

CENTRE OF MOTION. The point about which any body, or system of bodies, moves.

Ceola. A very old term for a large ship.

Cephalopod. An animal of the sub-kingdom *Mollusca*, characterized by a distinct head surrounded by a circle of long arms or tentacles.

Cepheus. *α Cephei*, Alderanim; *β Cephei*, Alphirk. See CONSTELLATION.

Ceradene. A large fresh-water mussel.

Cercuri. Ancient ships of burden fitted with both sails and oars.

Certificate of Registry. A document which specifies the names of the vessel, master, and owners, together with the tonnage, particulars as to origin, and the port to which the vessel belongs.

Cetacea (Gr. *katos*, a whale). An order of mammals living in the sea or large rivers, and shaped like fishes for moving habitually in the watery element, having the posterior part of the spine disencumbered of a sacrum and hinder extremities to allow the tail to have a due freedom and extent of motion. They breathe air, have warm blood, and a double circulation, like the rest of the class to which they belong; they are consequently compelled to resort to the surface for the purpose of respiration; and the tail-fin is accordingly horizontal and not vertical, as in some fishes.

Cetine. An ancient float, "in bulk like a whale;" derived from *cetus*, which applied both to whale and ship.

Cetus. *α Ceti*, Menkar; *β Ceti*, Diphda. See CONSTELLATION.

C. G. (*Eng.*). Coast-guard of Great Britain (which see).

Chad. A fish like a small bream, abundant on the southwest coasts of England.

Chafe. To rub or fret the surface of cables, masts, yards, etc.

CHAFING-CHEEKS. An old name for the sheaves in the yards.

CHAFING-GEAR. Mats, strands, battens, etc., for protecting objects from injury by chafing.

Chaffer. A name for a whale or grampus.

Chain. A series of connected links. A chain-cable. A lineal measure of 4 rods, or 66 feet, divided into 100 links. When mountains, lakes, or islands are joined together so that their length greatly exceeds their breadth, they form what is termed a chain.

CHAIN-CABLE. See CABLE.

CHAIN-HOOK. An iron rod with a hook at one end and an eye for the hand in the other, used in working the chain-cables.

CHAIN-LOCKER. A locker in the hold in which the chain-cables are stowed.

CHAIN-PIPE. An aperture in the deck through which pass the chains from the locker to the deck above.

CHAIN, TOP-. A chain to sling the lower yard in action.

CHAIN-STOPPER. See STOPPER.

CHAIN-WELL. See CHAIN-LOCKER.

Chains. Iron links which secure the dead-eyes connected with the channels. See CHANNELS.

CHAIN-BOLT. The bolt which passes through the toe-links and secures the chains to the side.

CHAIN-PLATES. Iron plates to which the dead-eyes are secured; they are often substituted for chains, being considered preferable.

Chain-shot. Two balls connected by a chain for cutting the spars and rigging of an enemy's ship.

Chaland. A large flat-bottomed boat of the Loire.

Chalder. A gudgeon.

Chaldrick. A name for the sea-pie (*Hæmantopus ostralegus*).

Chaldron. A measure of coal equal to 36 bushels.

Chalink. A kind of Massoolah boat.

Challenge. The hail of a sentry to a person approaching. See DUEL.

Chamæleon. See CONSTELLATION.

Chamber. A contraction of the bore of a gun which receives the charge of powder. The chamber in general use is the conical or gomer chamber. The ballistic power of some of the European guns has been augmented by adding to the weight of the charge and igniting it in a space considerably larger than that occupied by the powder. This increased space is obtained by enlarging the chamber. If the charge had not been increased the air-space would have caused a diminution both in velocity and pressure, the latter decreasing in a greater ratio than

the former; but, by judiciously increasing the weight of the charge, it has been possible to generate a greater volume of gas behind the projectile without carrying the maximum pressure beyond that which obtained when the old cartridge and full chamber were used.

A clear space between the riders in those vessels which have floor and futtock riders.

CHAMBER-PIECE. A movable piece to fit into the breech of old guns. See GINGAL.

Chamfer. To cut or take off a sharp edge or angle.

Champlin, Stephen, Commodore U.S.N. Born at South Kingston, R. I., November 17, 1789; died at Buffalo, February 20, 1870. His father, Stephen, was a volunteer in the American Revolution. His mother, Elizabeth Perry, was an aunt of Commodore Perry. At 16 he began a sea-faring life, and at 22 commanded a ship out of Norwich. May 22, 1812, he was appointed sailing-master in the navy; lieutenant, December 9, 1814; commander, June 22, 1838; captain, August 4, 1850; and commodore on retired list, July 16, 1862. He first commanded a gunboat under Perry at Newport; was second in the command of the "Asp" in the affairs of Little York and Fort George, U. C.; and, joining Perry at Lake Erie, took command of the "Scorpion," in which he did good service at the battle of September 10, 1813, capturing the "Little Belt." Of this battle, in which he fired the first and last guns, he was the last surviving officer. In the following spring he commanded the "Tigris," and, while blockading Mackinac, was attacked at night by an overwhelming force, severely wounded, and made prisoner. In 1816 he commanded the "Porcupine," but performed little subsequent service on account of his wound. He was a resident of Buffalo from 1834.

Chancery, In. See IRONS, IN.

Chancy. Doubtful.

Chandler, Ship-. A dealer in naval stores.

Change. The voluntary substitution of a different voyage for a merchant ship from the one originally specified or agreed upon,—an act which discharges the insurers.

Changey-for-Changey. An expression used in relation to a "swap," to denote that each party is satisfied with his bargain.

Channel. An arm of the sea separating an island from the mainland, or two islands from each other. The fair-way or deepest part of a river, harbor, or strait.

CHANNEL-GROPERS (*Eng.*). Men-of-war which cruise in the English Channel.

Channels. Flat ledges of white-oak plank projecting outboard from the ship's side for spreading the lower shrouds and giving additional support to the masts; also called *chains.*

CHANNEL-BOLTS. The bolts driven through the channels edgewise, and through the frame and planking, to secure them to the ship's side.

CHANNEL-PUMP. A pump rigged in the channels.

Chape. The top locket of the scabbard of a sword.

Chapel. In a light breeze when the ship comes to against the helm, or is taken aback by a shift of wind, or by negligence at the helm, she may be recovered on the same tack without bracing the head-yards, by causing the ship to make a complete circle, until she arrives at her original position. This manœuvre is called *chapeling ship*, or *building a chapel.*

Chaph. *β Cassiopeiæ.*

Chaplain. See NAVAL CHAPLAIN.

Chapman. A small trader; a ship's supercargo.

Char. A species of trout.

Charcoal. A form of carbon obtained by burning wood with the imperfect access of air, or by heating or distilling it in iron cylinders so constructed as to allow of the collection of the volatile products, among which are *tar* and *pyroligneous acid*, which is impure vinegar. The purity of the carbon varies directly with the temperature at which the wood is charred; thus, charcoal charred at 480° contains 65 per cent. of carbon, while that charred at 750° contains 80, and that charred at 2730° contains 96; but the loss of charcoal occasioned by these high temperatures is very great, the three percentages of charcoal corresponding to these temperatures being 50, 20, and 15. Among the many uses of charcoal, that of most interest to military and naval men is its employment in the manufacture of gunpowder (which see). For this purpose the charcoal from willows and alder is now chiefly used. A peculiar kind of charcoal, termed from its color *charbon rouge*, is prepared in France for the manufacture of the gunpowder used for sporting purposes, by subjecting wood in iron cylinders to the action of superheated steam under a pressure of two atmospheres. Powder made with this charcoal absorbs moisture more rapidly than ordinary gunpowder.

Charge. The quantity of powder used in loading a fire-arm or in filling a shell or torpedo. *Service* charges are the ordinary charges authorized by the bureau of ordnance. *Battering* charges are larger than the service charges, and are used for a limited number of fires against ironclads or masonry at short range. A *bursting* charge is the full charge of powder used in a shell; a *blowing* charge is a small quantity of powder used in a shell in target practice when the object is to test the fuse.

Charge and Specification. The formal written statement of the offense alleged to have been committed by the accused before a general court-martial.

In the British service there is no distinction between the "charge," as such, and the "specification;" the fact, or body of facts, constituting each offense being only presented in a single sentence or paragraph, the separate paragraphs being numbered where the charges are more than one, but—even when the offenses are all of the same class and character—introduced by no general title or descriptive heading. In our service, on the contrary, a military charge consists of two parts,—the technical "charge" and the "specification." The former defines and designates the offense, and the latter sets forth a certain state of facts which are supposed to make out such offense. See COURT-MARTIAL.

Chargé d'Affaires. The designation of diplomatic agents of the third class.

Charity Sloops (*Eng.*). Certain ten-gun brigs built toward the close of Napoleon's wars. They were rated sloops in order to give a command to a great number of commanders.

Charles's Wain. The seven principal stars in Ursa Major, generally known as the "Dipper."

Charleston. A port of entry and the largest city of South Carolina, situated at the confluence of the Ashley and Cooper Rivers, which unite immediately below the town and form a good and spacious harbor, communicating with the ocean at Sullivan's Island, 7 miles below. It is 118 miles N.E. of Savannah, 580 miles S.W. of Baltimore, and 540 miles from Washington. Lat. 32° 46′ N.; lon. 79° 57′ W. Cooper and Ashley Rivers are from 30 to 40 feet deep, the former 1400 and the latter 2100 yards wide. The ground on which the city is built is elevated 8 or 9 feet above the level of the harbor at high tide, which rises about 6 feet, flowing by the city with a strong current, thus contributing to its salubrity. It has a water front of 9 miles. A sandbar extends across the mouth of the harbor, affording, however, two entrances, of which the deepest, near Sullivan's Island, has 18 feet of water at low tide. The harbor is defended by Castle Pinckney and Fort Sumter, each on an island, the former 2 and the latter 6 miles below the city, and also by Fort Moultrie, on Sullivan's Island. Charleston is the most commercial city of South Carolina, and has an advantageous position for trade, having a harbor deep enough for the largest ships. Pop. 60,000.

Charley Noble. The popular name for the galley-funnel.

Chart. Chart is derived from the Greek *chartēs;* Latin, *charta*, which was originally applied to a sort of paper made of the plant papyrus or biblus.

In navigation it is defined as a representation, *in plano*, of a part or of the whole of the water on the surface of the globe and the adjacent coasts.

To trace the history of cartography, an art probably as ancient as the invention of letters, would exceed the limits of this article. The period from Anaximander to Henry the Navigator, extending over two thousand years, belongs rather to the province of the antiquary.

Unquestionably the ancients had sea-maps which guided their barks in voyages of adventure or profit, and did we possess fuller sources of information much that is interesting might be said of them. But of such knowledge a celebrated historian has remarked, "We possess only what has drifted ashore from a stranded vessel."

Charts, therefore, as we understand them, may be assigned to the epoch of the inauguration of maritime enterprise among the nations of modern times. To Prince Henry, Duke of Visco, son of John I., King of Portugal, is ascribed the credit of first introducing them into the marine, about the year 1400. These were of the kind denominated plane charts, and they have continued in use to the present day, being now employed only for very limited areas.

The first chart made in England appeared in an almanac printed on vellum in 1520.

In 1542, John Rotz, a Frenchman, made for King Henry VIII. "A Book of Hydrography," containing charts of the sea-coast finely painted on large skins of parchment, still preserved in the British Museum.

For any considerable extent of surface charts of this construction were soon found to be incorrect, and their errors were successively exposed by Martin Cortes, Petrus Nonius, and Edward Wright; especially the last named, in his treatise entitled "Certain Errors in Navigation Detected and Corrected," published at London in 1599.

With a view to correcting these errors, Gerard Kauffman, more familiarly known by the Latin equivalent *Mercator* (merchant), a Flemish geographer, in the year 1556, published a chart in which the parallelism of the meridians was compensated for by increasing the length of each degree of latitude from the equator towards the poles. It, however, appears that his charts had no claim to accuracy; for the intervals between the parallels did not agree with the differences of the corresponding meridional parts of those parallels. It seems evident, therefore, that Mercator had no correct method of dividing the enlarged meridian.

The discovery of a rule for this purpose was made by Wright and published in his book above mentioned. He states that the idea was suggested to him by Mercator's chart, "But the way how this should be done I learned neither from Mercator nor any man else."

The primitive idea of the projection upon which all our modern charts for navigating purposes are constructed, expressed in the quaint language of its author, is as follows:*

"Suppose a sphærical superficies, with meridians, parallels, rumbes, and the whole hydrographicall description drawn thereupon, to be inscribed into a concave cylinder, their axes agreeing in one. Let the sphærical superficies swell like a bladder (whiles it is in blowing) æqually alwayes in every part thereof (that is, as much in longitude as in latitude) till it apply, and joyn itself (round about, and all alongst till towards either pole) unto the concave superficies of the cylinder; each parallel upon the sphærical superficies increasing successively from the æquinoctial towards either pole, until it come to be of æqual diameter with the cylinder, and consequently the meridians still widening themselves, till they come to be so far distant everywhere each from the other as they are at the æquinoctial. Thus it may be most easily understood how a sphærical superficies may (by extension) be made cylindrical, and consequently a plain parallelogram superficies; because the cylinder is nothing else but a plain parallelogram wound about two æqual equidistant circles. . . . Since in this projection the parallels are all made æqual to the equator, it is evident they are enlarged in the proportion of the radius to the co-sines of their respective latitudes; wherefore the meridian, in order to preserve everywhere its proportion to the several parallels thus increased, must, at the latitude of each parallel, be enlarged in the proportion of the radius to the co-sine of the latitude, or so that the length of a minute of the true or proper meridian, which upon the globe is the same in all latitudes, and æqual to a minute of the equator, may be to the length of a minute on the enlarged in any latitude, as the co-sine of the latitude to radius, or, which is the same, as radius is to the secant of the latitude. . . . Hence a table of natural secants to every degree and minute of the quadrant, and whose radius is 1, will express the several lengths of the enlarged meridian at the latitude belonging to those secants respectively. And hence the

* Properly speaking, this should be called Mercator's development; it is not a projection in the strict sense of the term.

sum of the secants of all the minutes from the beginning of the quadrant to the degree and minute of any parallel's latitude will be, in minutes of the equator, or nautical miles, the length of that part of the enlarged meridian which is contained between the equator and the given parallel."

In this manner Wright constructed his "Table of Latitudes for Graduating a Meridian in the General Sea-Chart," which has since obtained the name of "A Table of Meridional Parts," called by the French "*Latitudes Croissantes.*"

The above method of dividing the meridian is not geometrically accurate. Wright understood this, and devised "A conceit for dividing the meridian of the nautical planisphære that may satisfie the curious exactness of the geometrician." Since his time various mathematicians have improved on his method. The first correct solution of the problem appears in "Norwood's Epitome of Navigation," 1645. Its author is unknown, and the demonstration was not given; this was supplied by Mr. James Gregory, of Aberdeen, 1668, and more concisely at a later period by Dr. Halley.

In most works on navigation containing tables of meridional parts the calculations have been made on the supposition that the earth is a sphere, and this answers well enough for practical purposes. But theory, confirmed by observation, has shown our globe to be an oblate spheroid, and Sir Isaac Newton and others have calculated the ratio of the equatorial to the polar diameter; this is called the compression of the terrestrial spheroid. Its value has been variously estimated: that adopted by the Bureau of Navigation, is, $c = \frac{1}{299.1528}$.

On the Mercator chart the loxodrome, or ship's track, is developed as a right line making the same angle with each meridian crossed, and this constitutes its chief advantage over other systems for purposes of navigation. As for every increase of latitude a new scale of measurement is introduced, objects near the pole are increased in size but their outlines are not distorted. The relative positions of places with respect to a rhumb-line are correct, but the relative distances between places are not shown with precision.

Observed bearings, unless due north or south, or east and west at the equator, are never identical with bearings taken from the Mercator chart, and the error increases the higher the latitude. Such bearings being similar to courses on a great circle, it follows that this chart is not adapted for great circle sailing.

Since bearings obtained either by means of the magnetic needle or astronomical observations cannot be laid off with accuracy, it is evident that the Mercator projection does not answer for the more refined purposes of surveying.

All attempts to project a spherical surface on a plane result in more or less distortion of the country delineated, in large extents so great as to destroy the true proportion between the parts.

For map-making and plotting the data of a survey various projections are employed, such as the orthographic, stereographic, equidistant, conical, gnomonic, and polyconic; the last three are the only ones adapted to our present purpose. Since surveys are first plotted on one of these projections and then transferred to the Mercator chart for the use of the navigator, a brief consideration of them is not out of place here.

The conical projection is much used by European map-makers, and is drawn as if projected from the centre of the earth on the surface of a cone cutting the surface of the earth in the parallels of latitude equidistant from the extremes and middle of the required limits. Within moderate areas the distortion is quite inappreciable, and even for a considerable extent of country it is but trifling; on this account it, or some modification of it, is now generally used for maps. For purposes of accurate measurement it has the disadvantage that, with the exception of the meridians, all great circles are represented on it by curved lines. Now, all measurements between places on the earth's surface are necessarily made on the arc of a great circle, and for these to be accurately represented on paper it is of the greatest importance that the projection of every arc of a great circle should be a right line. This requirement prevents the use of the orthographic projection, which near its centre is the most accurate of all, and the same objection applies to the Mercator.

The gnomonic projection fulfills this requirement. It is formed by lines drawn through the several points from the centre of a sphere to a plane touching the sphere in a point near the middle of the country to be represented. The distortion is greater than in the orthographic or conical projections, but within the limits of a survey, so trifling as to be practically inappreciable. At a distance of 60 miles from the central point a mile so projected is but one foot too long, and no one chart on a moderately large scale exceeds 120 miles.

For detailed charts, such as are drawn by surveyors in the progress of a survey, the gnomonic projection is, practically speaking, accurate; and possessing the desired property of representing all great circles by straight lines, cutting each other at angles which within the required limits have no sensible difference from the angles at which the circles cut each other, it, or some modification of it, is much used by surveyors. The numerical computations necessary for this projection require a knowledge of conic sections; but such calculations are obviated by the use of Carrington's tables. Large charts of the gnomonic projection have been constructed for purposes of great circle sailing. Such charts are useful auxiliaries to rhumb sailing.

These two projections are used by the Admiralty surveyors and map-makers of Great Britain.

The United States Coast Survey and Hydrographic Office have adopted the polyconic system in the plotting of surveys. The coast charts of the United States are issued in this projection, and the largest extends from Cape Hatteras to Cape Sable. This is a modification of the conical projection, and supposes each parallel of latitude to be developed upon its own cone, the vertex of which is on the axis of the sphere at its intersection with the tangent to the meridian at the parallel. The "Projection Tables," published by the Bureau of Navigation, give a description of the theory and practical construction of this projection.

The survey is plotted on shipboard, as made from day to day, on blank projection sheets of

well-stretched drawing-paper. This work, together with all the data of the survey, is sent to the Hydrographic Office, where it is carefully revised; the several sheets combined form a polyconic chart on a large scale. The work is then ready for transfer to the Mercator chart.

The scale having been determined on, a Mercator chart is developed within the required limits in the following manner:

A sheet of Whatman's cold-pressed drawing-paper, previously stretched, is secured to the board by means of thumb-tacks; the usual instruments of the draughtsman should be within reach.

If the equator is to be included within the limits of the proposed chart, the values to be laid off for latitude are given directly in the table. Should the equator not come within the chart, then the difference of the meridional parts corresponding to the upper and lower latitudes gives these values. Such quantities may be directly measured off by means of a diagonal scale, or reduced to the proper proportions from a scale of yards, metres, etc. If, for instance, it be required to construct a chart on a scale of one-quarter of an inch to five minutes of arc on the equator, a diagonal scale may first be constructed, on which ten meridional parts, or ten minutes of arc on the equator, have a length of half an inch. Then, in the usual manner, multiples of one meridional part may be measured on the base-line, multiples of 0.1 on the lines parallel to the base-line, and multiples of 0.01 may be estimated between the parallels. If an inch scale be used, the meridional parts, before being laid down on the projection, must be multiplied by 0.05 or divided by 20, since 20 minutes of arc on the equator, or 20 meridional parts, have to be made equal to one inch.

Often it may be desirable to adapt the scale to a certain size of paper. In this case the extreme parallels are first drawn on the sheet, the distance between them measured, and the included number of meridional parts ascertained. Dividing the measured distance by this number gives the length of one meridional part, this represents the scale of the chart, and by it all the meridional parts taken from the table must be multiplied.

The practical construction is best shown by an example: Suppose a projection be required for a chart of 14° extent in longitude, between the parallels of latitude 20° 30′ and 30° 25′, and let the space available on the paper between these parallels measure 10 inches.

Entering the column headed 20° in the table of meridional parts and running down to the line of 30′ in the side column, will be found 1249.08; then entering the column headed 30° and running down to the line of 25′, will be found 1905.68. The difference, $1905.68 - 1249.08 = 656.60$, is the value of the meridional arc between those latitudes, for which 1′ of arc on the equator is taken as the unit.

On the intended projection, therefore, 1′ of arc of longitude will measure $\frac{10 \text{ in.}}{656.60} = 0.0152$ inches, which will be the scale of the chart; for the sake of brevity call this 0.015. By this quantity all the values derived from the table must be multiplied before laying them down on the projection, if they are to be measured by a diagonal scale of one inch. This should not be confounded with the *natural* scale, which is the proportion that the chart bears to the earth, obtained by reducing the number of feet in the minute of latitude to inches and dividing the product by the scale.

Draw now in the centre of the sheet a vertical straight line, and assume it to be the middle meridian of the chart. Construct very carefully on this line a perpendicular near the lower border of the sheet, and assume this perpendicular to be the parallel of latitude 20° 30′; it may also serve as the southern inner neat line of the chart. From the intersection of the vertical and horizontal lines thus drawn, lay off on the latter, each side of the middle meridian, seven degrees of longitude, equal to $0.015 \times 60 \times 7 = 6.3$ inches, and through the extremes draw parallels to the middle meridian, which will be the eastern and western inner neat lines of the chart. Find in the table the meridional parts for 21° 0′, which are 1280.97; subtracting from this number the parts corresponding to 20° 30′, and multiplying the difference by 0.015, we obtain 0.478 inches, which is to be laid off from the parallel of 20° 30′ on the verticals, and draw a straight line through the points thus established. Proceed in the same manner to lay off all the parallels corresponding to full degrees of latitude.

A degree of longitude will measure on this chart $0.015 \times 60 = 0.9$ inches; lay off on the extreme and middle parallels on each side of the middle meridian the distances 0.9 inches, 1.8 inches, 2.7 inches, etc., determining the points where meridians of full degrees cross the parallels on the chart, through them draw the meridians. Draw the outer neat lines of the chart and extend to them the parallels and meridians. Between the neat lines subdivide the degrees of latitude and longitude as minutely as the scale will allow. Subdivisions of longitude are found by dividing the degrees into equal parts, those for latitude being determined from the table, as explained for the full degree. Lastly, draw the border-lines and a compass, graduated into points and quarter-points, from the magnetic meridian.

The subdivisions between the parallels will serve for estimating distances. Distances between places bearing north and south of each other may be referred to the subdivisions between their parallels. Distances represented by lines at an angle to the meridians may be measured by taking a number of subdivisions near the middle latitude of the line to be measured in the dividers and applying them to that line.

A chart may be transferred from any projection to the Mercator by drawing a system of corresponding horizontal and vertical lines on both charts, forming minute squares, and the outlines and characters contained in each square of the one may be copied in the corresponding squares of the other.

The best trained eye and hand, aided by the most carefully constructed instruments, cannot render a chart perfect; but this fact is no excuse for careless, hasty execution.

The chart should be such that every portion of a sea-coast may be recognized without hesitation, and the best manner of approaching or avoiding it perceived and ports entered without the aid of a pilot in every state of weather, wind, and tide.

Besides the outline of the shore, with soundings

and off-lying dangers and relative positions of the principal points, its character should be accurately delineated. The extent of shoals, with the limits of the intervening channels, should be clearly shown and the sea-marks indicated, the directions expressed so tersely and simply that by the rapid opening or closing of the marks, and the sequence of the soundings, the mariner may be able to feel his way with decision and promptitude.

The topographic portion of such a chart should be complete, containing all the principal features which are conspicuous from the offing and the relative positions of secondary objects. The table of signs and abbreviations employed at the United States Hydrographic Office gives the necessary information respecting hydrographical representations.

For the purposes of the navigator the elaborate systems of orographic representation are not necessary, and it is needless to discuss here the relative merits of the methods of Lehman, Dufour, and others.

A judicious arrangement of light and shade, produced by increasing or diminishing the thickness of the *hachures* and inclining them so as to give the general idea of the course taken by a drop of water, supposing it to flow from the summit to the foot of a declivity, gives a plastic effect and satisfies the eye.

The title and other lettering on a chart should be executed in the plainest and neatest manner. Roman capitals are used for the principal titles, and other printing may be done in small Roman, Italics, and stump-writing.

The grand division of sea or land to which the chart belongs should be stated, also the date of survey, and by whom made; references to special plans that may be included within the limits; the longitude and prime meridian, or secondary, upon which the longitude depends; the latitude; the variation of the compass and its amount of annual change; the plane of reference to which soundings are reduced, and whether soundings are expressed in feet or fathoms; rise of spring-tides at full and change of the moon, and curves of equal variation.

Views of certain harbors and conspicuous objects are often drawn on the margins in Indian ink; in which case the bearings from the point of view should be given.

The work of the draughtsman being complete, the chart passes into the hands of the engraver, and is transferred to the copper plate; many months of careful labor must elapse before it is ready for printing and issue.

Another method of reproducing charts has, from its economy and facility, been much used by the United States Hydrographic Office, and the camera has been utilized for this purpose. By photo-lithography a chart may be reproduced; but this system lacks the clearness and accuracy of engraving, and it is not adapted to large extents. In preparing plans for this process particular care is required in making with clearness all the details, and the scale should be somewhat larger than that intended for issue.

Charts may be classed, according to their uses, under the following heads: Ocean, general, and coast charts, harbor plans, and physical charts. Various other charts are employed for scientific purposes, such as:

Chart, Variation, a Mercator chart upon which are laid down curves representing the variation of the compass at those places through which they pass. Such a chart was first constructed by Dr. Halley, in 1700, with a view to finding the longitude.

Chart of the Inclination, or *Dip of the Magnetic Needle*, containing curves expressing the amount of inclination, or dip of the needle, at the places through which they pass. The first chart of this kind appeared in England in 1721, and was published by Mr. Whiston in his treatise entitled "The Longitude and Latitude found by the Inclinatory or Dipping Needle."

Chart, Skeleton, or *Track*, blank sheets constructed on the Mercator projection for different latitudes, upon which the ship's track is to be plotted by the navigator during a cruise.

Chart, Physical, showing the streams, currents, and drifts of the ocean, prevailing winds, and meteorological data compiled from the records of navigators, made during voyages at all seasons of the year in all parts of the world.

Chart, Chorographic, a delineation of a particular country.

Chart, Heliographic, a representation of the body of the sun and of the *maculæ*, or spots, thereon.

Chart, Selenographic, a representation of the moon and the spots on her disk.

Chart, Telegraphic, a delineation of the telegraph on paper.

Chart, Topographic, a minute and scientific delineation of a tract of country. In a military sense it may have particular reference to fortifications, camps, and the movement of troops.

The charts published by the British Admiralty number over 2600, and are sold at prices varying from 6*d.* to 3*s.* each; this is below their actual cost.

In the financial year 1860–61 a sum of £11,000 was provided for this branch irrespective of the surveying, which required a larger sum. The sale of these charts in five years numbered 290,000 copies, besides the supply furnished the queen's ships.

There are 866 charts published by the United States Hydrographic Office, and, with a view to encourage their general use, they are sold below the cost price. There are over 700 charts published by the United States Coast Survey Office. —*George P. Colvocoresses, Lieutenant U. S. Navy.*

Charter. To charter a vessel is to take her to freight under a charter-party (which see).

Chartered Ship. One let to hire to one or more exclusively, or to a company. A *general* ship is one loaded with the goods of persons not connected in interest.

Charterer. The individuals, government, or company, hiring or chartering a ship.

Charter-party. A contract of affreightment in writing, by which the owner of a ship lets the whole or a part of her to a merchant for the conveyance of goods on a particular voyage, in consideration of the payment of freight. All contracts under seal were anciently called charters; they were divided into two parts, of which each party interested took one, and this was the meaning of the *charta-partita.* It was a deed or writing divided, consisting of two parts, like an indenture at common law. Lord Mansfield observed that the charter-party was an old informal

instrument, and by the introduction of different clauses at different times, it was inaccurate and sometimes contradictory. But this defect has been supplied by giving it, as mercantile contracts usually receive, a liberal construction in furtherance of the real intention and the usage of trade. The charter-party describes the parties, the ship, and the voyage, and contains, on the part of the owner, a stipulation as to seaworthiness and as to the promptitude with which the vessel shall receive the cargo and perform the voyage; and the exception of such perils of the sea for which the master and ship-owners do not mean to be responsible. On the part of the freighter, it contains a stipulation to load and unload within a given time, with an allowance of so many lay, or running days for loading and unloading the cargo, and the rate and time of payment of the freight, and rate of demurrage beyond the allotted days.

Chase. That part of a gun between the reinforce and the swell of the muzzle. A ship which is being pursued by an enemy. When a ship is so built as to be able to fire several guns right ahead or right aft, she is said to have *a good chase*. *To chase* or *to give chase*, to pursue a vessel. When the pursuer follows directly in the wake of the chase, it is *a stern chase*, which is said to be *long but sure;* each ship must depend entirely upon its speed, as there is little opportunity for manœuvring and a shift of wind would affect them equally; if the chaser have the superiority in speed there is little doubt but that the chase will be eventually captured.

To chase in the wind's eye, to chase to windward. The chaser should persevere even though inferior in speed, as an accident, a shift of wind, or a lucky shot may give her an advantage; on the other hand the chase should do her utmost to evade the pursuer, and to retard the time of being overtaken; as a fog, squall, shift of wind, darkness, or an accident to the chaser may enable the chase to escape.

CHASE-GUNS. See CHASER, BOW (or STERN).

CHASE-PORT. A port forward or aft, used for a chase-gun.

CHASER. A vessel pursuing another.

CHASER, BOW (or STERN). A gun so mounted as to fire nearly or directly ahead (or astern).

Chasse Marée (*Fr.*). A French coasting vessel, generally lugger-rigged.

Chat. A lazy fellow. A louse. A ship built on the Norwegian model. See CAT.

Chatham, Chest of (*Eng.*). An ancient institution, restored by Queen Elizabeth in 1590, for the wounded seamen of the Royal navy. It was supported by a tax on each man in the navy, according to amount of his pay. This tax was called smart-money.

Chauncey, John S., Commodore U.S.N. Born in New York. Appointed from New York, January 1, 1812.

Promoted to passed midshipman, 1821; sloop "Peacock," West India Squadron, 1822; in August, 1822, engaged in the capture of seven piratical schooners off Bahia Honda, Cuba, and a heavily-armed pirate-schooner by the boats of the "Peacock"; was ordered to command one of the prizes; the vessel was nearly decimated by yellow fever,—thirty to forty deaths among the crew, and three or four lieutenants, himself the only midshipman remaining on duty; ordered to schooner "Grampus," West India Squadron, as acting lieutenant, by Commodore Porter, 1823; ordered to sloop "Ontario," as lieutenant, 1824; Mediterranean Squadron, 1824–26.

Commissioned as commander, September 8, 1841; commanding sloop "Vandalia," West Indies, Home Squadron, 1843–45; inspector of ordnance, Washington, 1847–50.

Commissioned as captain, September 14, 1855; commanding steam-sloop "Susquehanna," 1861; engaged at Forts Hatteras and Clark, as second in command, August 29 and 30, 1861; in command of the blockade of sounds of Virginia and North Carolina, September, 1861.

Commissioned as commodore, July 16, 1862; inspector of ordnance, Reading, Pa., 1863; special service, court-martial duty, 1864–65; special service, navy-yard, New York, 1866–67; retired 1868; died 1874.

Chaw. To chew. A quid of tobacco.

CHAW-MOUTH. An opprobrious epithet.

Cheat the Devil. One is said to *cheat the devil* when, instead of being profane, he makes use of such expressions as *darn it*, *deuce take it*, etc.

Cheat the Glass. See FLOG THE GLASS.

Chebacco-boat. A boat employed in the Newfoundland fisheries.

Chebec. See CHEBACCO-BOAT.

Check. *To check* a brace, bowline, etc., is to ease it off. *To check* the headway is to lessen the ship's progress through the water. *To check* a cable is to stop it from running out rapidly.

Checkered Sides. Sides of a ship painted to show all the ports; particularly applicable when there are two or more rows.

Checking-line. A small line bent to the eye of the topgallant or royal lift and brace, and rove through a bull's-eye at the mast-head, to haul the lifts and braces in when the light yards are sent down.

Cheek. Impudent assurance. The side of a gun-carriage. The side of a block. Generally, in any machine where there are two flat timbers or parts which are similar to each other, each timber is called a *cheek*.

CHEEK-BLOCK. A block bolted to a mast or gaff, and having only one cheek, the mast or gaff forming the other side of the block.

CHEEK-KNEES. Knees worked above and below the hawse-pipes in the angle of the bow and cut-water, the brackets being a continuation of them to the billet or figure-head.

Cheeks. An old sobriquet for a marine, derived from a rough pun on his uniform in olden days.

Cheer. To animate; to encourage. To salute a person or ship by huzzaing. *To cheer ship* is to send the men in the rigging and salute a passing ship by cheering. It is forbidden by the regulations to give cheers to any officer on joining a ship, while attached to her, or on being detached from her. *What cheer?* How fare ye?

CHEERILY. Heartily; with a will.

Cheese. A circular wad covered with canvas.

Chelynge. An old name for the cod-fish.

Cherbourg. A fortified seaport town and important naval station of France, department of Manche, on the English Channel, at the north end of the peninsula of Cotentin, about 85 miles west of Havre. Lat. 49° 40′ N.; lon. 1° 35′ W. Pop. 38,000. The principal buildings are the

military and naval arsenals, hospitals, and barracks. The commercial and naval ports are quite distinct from each other. The commercial port consists of a harbor and a basin, 1338 feet long and 416 feet wide. The basin communicates with the harbor by dock-gates, which prevent the reflux of the water. The channel from the harbor to the sea is 1968 feet long and 164 feet wide, lined by a granite quay with parapets. In this channel the depth of water is never less than 19½ feet. The *Port Militaire* and *Arsenal de la Marine* consist of a port 984 feet long and 754 feet wide, capable of containing 50 large ships of war, and accessible at all times of tide for vessels of the largest class; a floating-basin closed by lock-gates, and a third basin. There are four slips for vessels of the largest size; adjoining these slips is a dry-dock. The great work, however, for which Cherbourg is noted is the *digue*, or breakwater, stretching across the roadstead. The *digue* was commenced by Louis XVI., and finished in 1858. It is 2¼ miles from the harbor, in water varying from 40 to 65 feet deep. Its proportions are—length, 4120 yards; breadth at base, 262 feet; at top, 102 feet. The entrance east of the *digue* is 3285 feet wide, and that to the west 9875 feet. A fort and light-house occupy the centre of the *digue*, and there are also light-houses at each entrance to the roadstead, and one at the entrance to the commercial port. The defenses consist of the batteries of Fort National, of 100 guns, on the Isle of Pelée, and many other forts, which render Cherbourg, if not impregnable from the sea, at least very difficult of attack.

Cheremeri. In the East, a bribe in making a contract or bargain.

Cherry. A species of smelt or spirling in the Frith of Tay.

Chesil. A term used for a bank of shingle.

Chess-trees. Formerly, certain pieces of oak timber, fayed and bolted to the topsides, one on each side, abaft the fore-channels, which had a sheave fitted in the upper part, for the convenience of hauling home the main tack.

Chest. A box of wood in which articles are deposited; as, an arm-chest, a top-chest, etc. A *sea-chest* is generally capable of being taken apart and stowed in a small space.

Chester (Pa.), on the Delaware River, 15 miles below Philadelphia. The celebrated ship-yards of John Roach, which give employment to 2500 men, are situated here. Pop. 15,000.

Chest-rope. Guess-rope, or guess-warp.

Chevender. An old name for the chevin or chub.

Chevil. See Cavil.

Chevron. The distinguishing stripes on the sleeves of non-commissioned officers of marines.

Chevy. To shake or force with a shivering motion.

Chewing Oakum, or Pitch. Said of a vessel which leaks from inefficient calking, or on account of the working of her timbers.

Chicago (Ill.), a port of entry and the most important centre of commerce in the Northwestern States, is situated at the mouth of the Chicago River, on the southwestern bend of Lake Michigan. Lat. 41° 53′ 3″ N.; lon. 87° 37′ 30″ W. The length of the city from north to south is from 7 to 8 miles, and its breadth from east to west about 5 miles; area, about 36 square miles. It is divided by the Chicago River and its branches into three parts, the north, south, and west divisions, which are connected by 33 bridges and 2 stone tunnels under the river-bed, one 1890 feet long under the main river, the other 1608 feet long, under the South Branch. Of these divisions the west is nearly double the size of the other two combined, embracing 15,104 acres, while the north contains but 2533 acres, and the south 5363 acres. The imports into Chicago during 1879 aggregated $9,000,000. The amount of duties received was $1,451,536. The exports reached the large sum of $10,000,000. The first shipment of wheat was made from Chicago in 1839, and amounted to 1678 bushels. In 1879 the receipts of grain of all kinds were 138,154,571 bushels, while the shipments were 121,094,000 bushels. Pop. 477,000.

Chief. A familiar appellation for the senior engineer on board ship.

Chief Officer, or Chief Mate. The first mate; an officer of a merchant vessel next in rank to the master.

Chief-of-staff. A line-officer who is attached to the flag-ship, and assists the commander-in-chief or flag-officer in the various details and arrangements for the management of the fleet or squadron. At present the duties of the chief-of-staff are performed by the commanding officer of the flag-ship.

Chigre. A minute insect of tropical countries, which pierces the bottom of the foot and breeds there, producing great pain. See Jigger.

Chili. This comparatively small republic, which cast off the Spanish yoke in 1810, now boasts a population of 2,000,000, an annual export trade of $19,000,000, and a revenue of $20,000,000. Its greatest enemies are its near neighbors, and to check them the state maintains a navy of 10 small steamers of 120 to 300 horse-power, and 2 powerful ironclads. These two latter vessels are each 210 feet long and 45 feet in breadth, of 2200 tons measurement, and of 2500 horse-power. The battery is amidship, and is armed with 6 12½-ton rifled guns. The range of fire in both ships is peculiar, for although they have the appearance of ordinary broadside ships, they are able, with the three guns on each side, to fire over all the points of the compass. This advantage was obtained by placing each of the fore-and-aft guns at the corners of the battery, and raising the side of the ship so as to enable the foremost guns to fire right forward and in a line with the keel, and in like manner the aft guns fire right aft. The corners of the batteries are made of an octagonal shape, so that the same guns which fire right forward and aft can be brought into the broadside position, and command any angle between them and the line of the keel. The midship guns on each side are made to fire with broadside, and also to support the fire of the forward guns.

Chilled Shot. Shot which are rapidly cooled after being cast. They are very hard but brittle.

Chimbe, Chime, or Chine. The ends of the staves which project beyond the head of a cask.

Chimbe and Chimbe. End to end; as, casks or barrels.

Chime in. To join in.

Chinckle. A small bight in a line.

Chine. To hollow out slightly. That part

of the water-way which is above the deck and hollowed out or beveled off to the spirketing. See CHIMBE.

Chinese Navy, The. The Chinese navy dates back to a period before the foundation of the British navy was laid under the last two Henrys. The art of ship-building has a great antiquity in China. The junks of to-day, unaltered as they are from designs dating centuries back, will compare favorably with the coasting craft of some Western countries now, and those in existence nearly three hundred years ago must have equaled in most respects and surpassed in many the barques, pinnaces, and caravals which sailed under the successors of Magellan and Andrade. The sea-going war-junks were often of large size, easily handled, and not bad sailers. Many of them had high bulwarks and pentagonal port-holes. Guns were mounted only on the upper deck, frequently on immovable carriages, and the crews had but the most slender knowledge of gunnery.

Early European travelers were often struck by the condition of the Chinese forces. Of the navy, one authority writes: "The greatest ships they have are called 'juncos,' which are very great and are made for the wars, with castles very high in the poop and prore, like to the ships of the Levant. There are so many of these that it is easy for any general of the sea to join together in a little time a navy of from five hundred to a thousand of them."

But from the early part of the 17th century onward, while progress in Europe was rapid, Chinese naval architecture remained stationary. When the British first came to blows with the Chinese nearly forty years ago, their army and navy were equipped in a manner which showed that but little advancement had been made since the middle of the 17th century.

"In 1876 a naval yard was established near Shanghai, and though there are a few Englishmen and Americans holding posts in it, the control of it is exclusively in the hands of native officials. Two steam-frigates of nearly 3000 tons measurement and five gun-vessels had been launched from it three years ago, and a small ironclad for river service completed. Of the frigates one was in commission, and the writer, who has seen her actually at sea, was allowed to go over her when lying at anchor near Shanghai. She is a handsome craft, completely armed with Krupp guns. Her crew from the captain down, without exception, is composed of native Chinamen. She did the Chinese credit in all respects. Attached to the dock-yard is a large military arsenal, in which are stored guns and small-arms of all descriptions, and in which projectiles for heavy and field guns and breech-loading rifles of the Remington pattern were being continuously produced. Heavy machinery for the manufacture of armor-plates was being erected in a portion of the works. On the opposite bank of the river may be seen the great powder-factory, not long ago constructed for the manufacture of gunpowder of the European kind.

"But perhaps the most marked instance of progress in this direction is to be observed at, or rather near, the treaty port of Foochow. Under the authority of the distinguished Tso-Tsung-Tang, M. Giguel, an officer of the French navy, began some twelve years ago to form a dock-yard on the Min River, a few miles below the city just mentioned, which could be easily fortified. The extraordinary success which has attended his labors will be understood by some knowledge of the difficulties with which he had to contend. The very ground on which the navy-yard is formed had to be made. The soil was alluvial, formed by a thick layer of solidified mud covered with a coating of nearly liquid clay. In consequence of the freshets in the river, the level of the ground had to be raised five feet. In spite of these and other disadvantages, M. Giguel, at the end of seven years, had iron-works, rolling-mills, engine-factories, and building-slips—in fact, all the plant of a naval yard—in full working order; and had actually built the engines, and, in some cases, the armament for no less than fifteen vessels, of which eleven were over 1000 tons displacement. Not only this, but a school for naval officers had been formed, and a training-ship, fitted to make cruises at sea, had been attached to the establishment.

"Even this account of several great arsenals would not exhaust all that might be said in description of what has recently been done in China to increase the efficiency of the army and navy, which she has begun to consider necessary to her well-being."

The Chinese do not rely entirely upon their own dock-yards constructors. In addition to the fleet of native production, they have recently had constructed in England a series of gunboats of the latest types, armed with the most improved and heaviest guns.

In 1876–78 four gunboats were completed at the works of Sir William Armstrong for the Chinese government, of the British "Staunch" type, designed by a member of the firm, the talented engineer, Mr. G. W. Rendel, but in which several important improvements upon that type were introduced. These boats were named "Alpha," "Beta," "Gamma," and "Delta." The first two are each 118 feet long and 27 feet beam, with a mean draft of 7 feet 6 inches, and a displacement of 319 tons. The last two are 120 feet between perpendiculars by 30 feet beam, having a draft of 8 feet and a displacement of 400 tons. They are schooner-rigged, with tripod masts, are propelled by twin-screws, and can steam 9 knots per hour.

But the increased dimensions of these last two vessels were of trivial importance compared with the difference in their armament; for while the first two carry each a 26½-ton gun, the others carry each a 38-ton gun of the British service pattern. The mounting of these guns on vessels of only 400 tons displacement was a most daring innovation, and its boldness becomes more apparent when we remember that the only guns of the same weight and calibre then afloat were the two in the fore-turret of the great British ship "Thunderer," and that vessels of the size of these generally carried guns not exceeding 5 or 6 tons in weight, and even the "Staunch," considered a serious innovation, a gun of only 12½ tons weight.

The system of working these guns is noticeable, the piece being so much heavier than those used in the English boats, and the little vessel herself being made to act as the gun-carriage. The gun is worked by hydraulic power, and the entire arrangement of the mechanism is similar

to that employed by the Italians in working the 100-ton gun at Spezia. Two heavy iron beams in the fore part of the vessel are placed side by side, on a level with the deck and parallel with the keel; on these beams are bolted frames analogous to the cross-head guides of a horizontal engine, and the trunnions of the gun are fitted in side-blocks, these last taking the place of the cross-head. Thus arranged, the gun can slide back and forth through a range of about three feet. The preponderance at the breech-end is supported by two secondary parallel bars inside the main gun-beams. These are hinged at the rear end, while at the forward end they are carried on the cross-head of a vertical hydraulic ram fixed beneath the deck. The breech-end of the gun is supplied with a hoop and lugs; the lugs rest on the two secondary bars near their hinged ends, and thus, by causing the hydraulic ram to rise or fall, the gun can be elevated or depressed at will. No turning gear is provided, the lateral training of the gun being effected by turning the whole boat through the required arc by the use of the rudder and twin-screws. To run the gun in and out, two hydraulic cylinders are used, one of which is fixed horizontally on each side-beam, the cross-heads of the rams taking hold of the trunnion side-blocks. The recoil is taken up by these rams, or, more properly, pistons, delivering water under a weighted valve. The gun is loaded by a hydraulic rammer, the shot being brought to the muzzle by a trolley or carriage, off which it is pushed into the bore.

During the trials of the "Gamma," the 38-ton gun was fired with charges consisting of 130 pounds of powder behind an 800-pound projectile, the elevation being 3½ degrees. The initial velocity was 1500 feet per second, and, as tested at Shoeburyness, capable of penetrating 19½ inches of iron in three thicknesses, sandwiched with 10 inches of teak. In addition to the heavy guns, two 12-pounders are also carried, and a machine-gun of the Gatling type.

These vessels are iron-built, and each carries 50 tons of coal and 50 rounds of ammunition. They all made successful passages to China, the first two being delivered at Foochow in 1876, and the last two at Tientsin in 1878.

But the Chinese did not stop with the construction of these four boats. Four more, built on the Tyne under the supervision of the Elswick firm, and armed each with a 35-ton gun of the Armstrong new type, sailed from England in July, 1879, for China. These boats, or "floating gun-carriages," are substantially of the same design and construction as those which have already been described. The most important difference is that they are built of steel instead of iron, and are double-ended, the stern and bow lines being after the same model, and are fitted with bow rudders, which enable them to steam either backward or forward. The bulwarks have been heightened to give additional cover to the men.

In addition to the vessels already described, there have also been built in England for the Chinese navy eight small gunboats, of from 100 to 220 tons displacement, each carrying from 2 to 7 guns.

At the Foochow arsenal there have been built seventeen composite gunboats, each mounting one 7-ton or 9-ton gun with other light pieces, one composite corvette, carrying 11 guns, one of 11 tons weight, and three transports. There are also the two wooden frigates and the five gun-vessels already mentioned as constructed at Shanghai. All of these vessels are now doing duty in southern waters.

In addition to these gunboats, the Chinese have determined to still further equip themselves for coast defense by providing a supply of torpedo-boats, and the first of the series proposed, an experimental boat, was shipped from England to China in August, 1879. Its dimensions are as follows: length, 52 feet; breadth, 7 feet; mean draft of water, 3 feet 6 inches; maximum speed, 16 knots per hour. It is built of steel, is divided by six water-tight compartments, and is arranged to work three spar-torpedoes.

The Chinese authorities have also taken the initiative step in the formation of an ironclad fleet, by ordering from Messrs. Mitchell & Co., on the Tyne, England, a double-turreted steel armor-clad, to have a speed of 16 knots, the machinery to be built by Hawthorne, of Newcastle.

Chinse. To stop small seams by working in oakum with a knife or small iron when the seam will not bear the force required for calking.

Chinsing-iron. A light calking-iron.

Chip. The triangular piece of wood attached to the log-line. See Log.

Chips. The familiar sobriquet of the carpenter on board ship.

Chit. A note; an I. O. U. In China they have a silver currency which being inconvenient to carry, credit is universally given by the merchants, the purchaser giving a *chit*, which is presented for settlement at the end of the month.

Chit-book. A book of printed forms for chits.

Chiton. A mollusk with a many-jointed shell covering its back.

Chiule. A Saxon ship.

Chivey. A knife.

Chock. Entirely; quite; as, *chock-full*, *chock-home*, *chock-aft*, etc. A sort of wedge used to prevent a cask, or any other heavy body, from moving. Also, a small piece of wood fitted neatly into a larger piece of timber, in order to make good some deficiency in the main piece. Also, a piece sometimes placed between the head of the lower mast and the head of the topmast.

Chock-a-block. See Block-and-block.

Chock-channels. Channels with the spaces between the chain-plates filled in with wood.

Chock of the Bowsprit. A wedge-shaped piece fayed to fit the hole above the bowsprit, after the bowsprit was shipped, in order to secure it.

Chock of the Rudder. In former times a piece of timber fitted and kept in readiness to stop the motion of the rudder in the case of any accident, and while a new tiller was being shipped.

Chocolate-gale. A brisk N.W. wind of the West Indies and Spanish main.

Chogset. See Burgall.

Choke. The nip of a rocket. To foul; as, a rope in a block. *To choke the luff*, to thrust the hauling part of a tackle close up to the block, under the other parts, thus jamming the hauling part and keeping the tackle from rendering.

Chokey. *In chokey*, in jail; in the brig.

Chommery. Jack's word for *chasse-marée*, a French coasting-vessel.

Chop (*Chinese*). A permit, or clearance. Quality; as, first chop, second chop, etc. A device or trade-mark.

CHOP-BOAT. A licensed lighter employed in transporting goods.

CHOP-DOLLAR. In China, when the silver dollar passes into a bank or large mercantile house it is tested and stamped; in the course of time these impressions become so numerous that the piece of silver bears little resemblance to the original coin. From the resemblance which one of these coins bears to the face of a person badly marked with smallpox, the individual so marked receives the sobriquet of *chop-dollar*.

Chop About. When the wind changes its direction suddenly it *chops about*.

Chopping-sea. Tumbling waves dashing against each other.

Chops. The junction of a channel with the sea; as, the chops of the English Channel.

Chow. See CHOW-CHOW.

Chow-chow. A word from the Chinese, meaning eatables.

CHOW-CHOW CHOP. The lighter containing the articles which complete a ship's cargo.

CHOW-CHOW WATER. Strong cross-currents and eddies in which vessels are difficult to manage.

Chowder. A dish made of pork, biscuit, onions, etc., and fresh fish or clams.

Chowder-head. A stupid fellow.

Christening a Ship. The present system of "christening" ships may be considered a relic of the ancient libation practiced when they were launched. The action of "blessing" ships is alluded to by the monks of St. Denys. In July, 1418, the Bishop of Bangor was sent to Southampton to "bless" the king's ship, the "Grâce Dieu," and received £5 for his expenses. In the fleet commanded by John de Outremarins against the Tunisians, according to ancient custom and to insure success, the ships were blessed by the priests; and being afterwards exposed to storms, the captains desired the soldiers and sailors to invoke the Lord, and while they were at prayer the wind became suddenly favorable. In 1242, when Henry III. was at war with France, a fleet was prepared in which that monarch embarked, after visiting the shrines of many saints, to propitiate their influence against storms, and to insure success to his arms. Before the Reformation it was usual for the priests at Yarmouth to give a blessing to the fishing-vessels yearly, and it was afterwards customary for the minister of the parish to preach a "fishing" sermon.

Christian. A gold Danish coin.

Christiania. The capital of Norway, situated at the head of the Christiania-Fiord, in lat. 59° 54′ 1″ N., lon. 10° 45′ E. The fiord is frozen for two months of the year from about 20 miles from Christiania to the sea, and the harbor is generally locked up for three or four months. Pop. 100,000.

Christiansand. A town of Norway, near its southern extremity, on a fiord of the Skager-Rack, 157 miles southwest of Christiania. Lat. 58° 8′ N.; lon. 8° 3′ E. The harbor is deep and well sheltered, and is defended by several batteries and by the fort of Christianholm, on the small island of Odderö, at the entrance of the harbor. Pop. 13,000.

Christian's Gales. The fearful gales of 1795–96, which nearly destroyed a fleet under Admiral Christian while on his way to attack the French West India Islands.

Chrockle. A thorough-foot (which see).

Chronometer (Gr. *chronos*, time; *metron*, a measure). A time-piece of superior construction, having adjustments and compensations for changes of temperature. The proposition to determine the longitude at sea by means of a time-piece and observation of the heavenly bodies was made by Gemma Frisius in 1530. In 1714 the British government offered a reward of £20,000 to the person who should so perfect this method as to determine the longitude within 30 miles. In 1758 John Harrison received this reward, his chronometer having shown an error of 18 miles during a five months' voyage. At the present day, under favorable circumstances, longitude determined by a chronometer can be relied upon to within two or three miles, and even this small error is due rather to the faults of observation than to the imperfections of the instrument. A sea-chronometer has for its moving-power a spring, the force of which is made uniform by a variable lever; it is carried through all varieties of climate, and is therefore furnished with an expansion balance, formed by a combination of metals of different expansive qualities.

In carrying a chronometer to and from the ship the gimbals are steadied by the stay, and care is taken not to give the instrument a circular motion. When on board, the chronometer is placed in a position not exposed to currents of air nor to sudden shocks, such as are occasioned by the striking of a sea against the side, or by the firing of salutes, etc., and metallic substances are kept at a distance from it.

The chronometers in use on board ship are generally constructed to run for 56 hours, but they are wound every day at 8 A.M. In winding it is handled carefully and the key turned steadily; a pocket-chronometer is held immovable in one hand in order to avoid a circular motion. If a chronometer should run down, it is started by giving it a quick circular motion in the plane of the dial; the hands are never touched. As no chronometer is absolutely perfect, the navigator ascertains its error and makes allowance for it. Three chronometers are supplied to government vessels, and they are compared with each other every day; a sudden change in one will be shown by the other two.

CHRONOMETER, ERROR OF. The error of the chronometer is the difference between the time indicated by it and any other given time. The error is *fast* or *slow* as the chronometer is in advance of or behind the time in question. Before sailing the navigator must know the error of his chronometer. It can be determined in a variety of ways, the most reliable of which is a comparison of the chronometer with the clock of an observatory. The general use of time-balls renders the clocks of the observatories available to everybody. In our ports the time at noon is always received at the telegraph-offices from the naval observatory at Washington. If unable to compare the chronometer with the clock of an observatory, the error is found by means of a sextant and an artificial horizon, either by a time-sight of the sun or star, or by equal altitudes of the sun or star.

CHRONOMETER, RATE OF. The *rate* is the daily

change of error; it is *gaining* when the chronometer is running too fast; *losing* if too slow. The rate is determined by finding the error on different days, and dividing the change of error by the number of days elapsed between the observations. On arrival at the first port after the beginning of a cruise, the navigator will generally find that the error of his chronometers, as shown by an observation or by comparison with an astronomical clock, does not coincide with the error shown by the rate obtained before sailing. By dividing the difference between this new error and the error on the day of sailing by the number of days elapsed a new rate is obtained, which is called the *sea-rate*, and thereafter is always made use of when at sea.

Chub. The *Leuciscus cephalis*, a fresh-water fish.

Chuck. A sea-shell. See Chock.

Chuckle-head. A stupid fellow; a lubber. A person with a large round head.

Chunam. A cement used in the East for the seams of ships. It becomes very hard, and when of good quality will take a polish.

Chunk-block. A strongly-made block, having a metal sheave and a large swallow.

Church. *To rig church*, to arrange the seats, altar, etc., for divine service on board ship. *To unrig church*, to clear up the decks after service.

Chute, or Shoot. A pipe or channel for conveying ashes, refuse matter, and other articles down to a lower level.

Cigar-boat. A peculiar boat shaped like a spindle, constructed by Winans.

Cingle. A belt worn by sailors.

Cinque Ports, The. These are five highly privileged stations, the once great emporiums of British commerce and maritime greatness; they are Dover, Hastings, Sandwich, Romney, and Hythe, which, lying opposite to France, were considered of the utmost importance. To these were afterwards added Winchelsea, Rye, and Seaford. These places were honored with peculiar immunities and privileges, on condition of their providing a certain number of ships at their own charge for forty days. Being exempted from the jurisdiction of the admiralty court, the Lord Warden of the Cinque Ports is authorized to make rules for the government of pilots within his jurisdiction, and in many other general acts exceptions are provided to save the franchises of the Cinque Ports unimpeached. It is a singular fact that it has never been legally determined whether the Downs and adjacent roadsteads are included in the limits of the Cinque Ports. All derelicts found without the limits by Cinque Port vessels are droits of admiralty. This organization was nearly broken up in the late state reforms, but the Lord Warden still possesses some power and jurisdiction.

Cipango. A marvelous island described by Marco Polo, and represented as lying in the eastern seas, 1500 miles from the mainland. It was an object of diligent search with Columbus and the early navigators. It is supposed by some to be the same as Japan. (Written also *Lipangi.*)

Circinus. The Roman compass. See Constellation.

Circle. A plain figure bounded by a curve, every point of which is equally distant from a point within it. The line bounding a circle.

Circle, Astronomical. A reflecting instrument for measuring angles, in which the limb is a complete circle of metal; as, the mural circle, reflecting circle, repeating circle, etc.

Circle, Diurnal. The diurnal circle of a heavenly body is the circle it describes in the apparent daily revolution of the celestial sphere. It is the parallel of declination passing through the body; only when the body is in the equinoctial is it a great circle. At the equinoxes the sun's diurnal circle is the equinoctial; at the summer and winter solstices, its diurnal circle in the heavens corresponds to the tropics of Cancer and Capricorn on the surface of the earth.

Circle, Hour. A great circle of the celestial sphere perpendicular to the equinoctial, and therefore passing through the poles of the heavens. See Co-ordinates for the Surface of a Sphere.

Circle of Altitude, Declination, Latitude. In the different systems of co-ordinates for the surface of the celestial sphere, it is the common practice to regard the secondary great circles as ordinate circles to the primitive, and they are hence named after that one of the co-ordinates which is measured *upon* them. Thus, the great circles which are ordinate circles to the horizon are called *Circles of Altitude*, because altitudes are measured upon them; the great circles which are ordinate circles to the equinoctial are called *Circles of Declination*, because declinations are measured upon them; and the great circles which are ordinate circles to the ecliptic are called *Circles of Latitude*, because latitudes are measured upon them. Under a different system of nomenclature these are severally called *Circles of Azimuth*, *Circles of Right Ascension*, and *Circles of Longitude*. See Co-ordinates for the Surface of a Sphere.

Circle of a Sphere. A circle on the surface of a sphere; when its plane passes through the centre of the sphere it is a *great circle;* in all other cases it is a *small circle.*

Circle of Azimuth, Right Ascension, Longitude. In the different systems of co-ordinates for the surface of the celestial sphere, some writers allow the conception of polar co-ordinates to predominate, and thus regard the secondary great circles as sweeping out angles at the pole; they therefore name them after that one of the co-ordinates which is marked out *by* them. Thus, the great circles passing through the poles of the horizon are called *Circles of Azimuth*, because they each mark out all points which have the same azimuth; the great circles passing through the poles of the equinoctial are called *Circles of Right Ascension*, because they each mark out all points which have the same right ascension; and the great circles passing through the poles of the ecliptic are called *Circles of Longitude*, because they each mark out all points which have the same longitude. Under a different system of nomenclature these are severally called *Circles of Altitude*, *Circles of Declination*, *Circles of Latitude*. See Co-ordinates for the Surface of a Sphere.

Circle of Illumination. Approximately one-half of the earth's surface is always illuminated by the sun, while the opposite hemisphere is in the shade. The great circle which at any instant is the boundary between the illuminated and darkened hemispheres is called the *Circle of Illumination.*

CIRCLE OF PERPETUAL APPARITION. A circle within which the heavenly bodies are always above the horizon.

CIRCLE OF PERPETUAL OCCULTATION. A circle within which the heavenly bodies are always below the horizon.

CIRCLE, POLAR. The polar circles are small circles of the terrestrial sphere, parallel to the equator, and 23° 28′ distant from the poles. The northern is the *arctic*, and the southern the *antarctic* circle.

CIRCLE, VERTICAL. A great circle passing through the zenith; the prime vertical passes through the east and west points of the horizon.

Circuit. A continuous electrical communication. A metallic circuit is one in which a return wire is used. To *short circuit* a battery is to connect its poles by a conductor whose resistance is practically zero.

Circular. An official letter, generally printed, copies of which are sent to several persons.

Circulating Pump. A pump used in connection with surface-condensers for circulating the refrigerating water through or among the tubes. It may be driven either directly by the reciprocating parts of the main engine, or by the intervention of beams or levers, or by an independent engine. In the latter case rotary pumps are much used. The refrigerating water is drawn through a pipe passing through the side or bottom of the vessel, and discharged, after having done its work, through another pipe, at or near the load water-line. Both of these pipes can be closed at the ship's side by valves called, respectively, the "injection valve" and the "outboard delivery valve." A branch suction-pipe, controlled by a valve, leads to the bilge, affording powerful means of freeing the vessel of water in cases of extraordinary leakage. See CONDENSER.

Circummeridian (Lat. *circum*, about). About or near the meridian. Circummeridian altitudes are taken when the body is near the meridian. See ALTITUDE.

Circumnavigate. To sail round; to pass around by water.

Circumpolar. Situated about the pole.

Cirripedia. A group of marine animals, allied to the *Crustacea.* They are free and natatory when young, but in the adult state attached to rocks or some floating substance. They are protected by a multivalve shell, and have long ciliated curled tentacles, whence their name (*curl-footed*). The barnacles (*Lepas*) and the acorn-shells (*Balanus*) are familiar examples.

Cirro-cumulus. See CLOUD.

Cirro-stratus. See CLOUD.

Cirrus. See CLOUD.

Cisco. A fish of the herring kind, of which thousands of barrels are annually taken and salted in Lake Ontario.

Cit. A citizen.

CITS. Citizen's clothing.

Citizen. In the United States, a person, native or naturalized, who has the privilege of voting for public officers, and who is qualified to fill offices in the gift of the people. (See ALIEN, NATURALIZATION.) The word is often used to distinguish a person engaged in civil pursuits from members of the military and naval services.

City of Masts. A name applied to London in allusion to the magnitude of its commerce.

Civil. The civil *time*, *day*, *year*, is that reckoning which is adopted for the social purposes of life. See TIME, DAY, YEAR.

Civil Engineer. See ENGINEER, CIVIL.

Civil Lord (*Eng.*). The junior member of the admiralty board.

Civil War. A war between subjects of the same realm, or between factions of the same state.

Civita Vecchia. A seaport city of Italy, on the Mediterranean, 38 miles by rail W.N.W. of Rome. Pop. 11,640. The port, which owes its origin to the Emperor Trajan, is one of the best in Central Italy. Two large moles form the harbor, and a breakwater outside protects the shipping from heavy seas; a light-house is erected on its southern end. Lat. 42° 5′ N.; lon. 11° 45′ E. The harbor has depth of water for vessels of 400 or 500 tons, and ships of greater draft may anchor inside the breakwater. The city has regular steam communication with the chief Mediterranean ports.

Clake. A name for the barnacle goose (*Anser bernicla*), and also for the *Lepas anatifera*, a cirriped often found attached to vessels or timber by a long fleshy peduncle.

Clam. A well-known bivalve shell-fish of different genera; as, the *Venus mercenaria*, the *Mya arenaria*, and others. *As happy as a clam at high water*, a figurative expression for indolent comfort.

Clamber. To ascend; to climb.

Clamps. The strakes of plank on which the deck-beams rest.

CLAMP-NAILS. Nails used to fasten the clamps.

Clang. The rattling and clashing of arms.

Clap. A burst of sound; as, a clap of thunder.

CLAPPER. The tongue of a bell.

Clap-match. A sort of seal distinct from the fur-seal.

Clap On. *To clap on* to a rope is to lay hold of it in order to haul upon it. *To clap on a stopper* is to put on a stopper; stop talking. *To clap on canvas*, to make more sail.

Clap-sill. The lockage of a flood-gate.

Clark, Ezra W., Chief of U. S. Revenue Marine. Born at Granville, Licking Co., O., in 1839, his father being Rev. Ezra W. Clark, for about forty years a clergyman of the Baptist Church in Ohio. After receiving a rudimentary education he was, at the age of twelve years, apprenticed to the printing business. Having acquired this trade he was prepared for college at Lima, N. Y. Subsequently he pursued the study of Mathematics with Prof. Aaron Schuyler, president of Berea College, O. He attended college at Otterbien University, in Ohio. He studied law with Hon. John K. Hord, of Tiffin, O. In April, 1861, he entered the Union army, and was a private soldier and subsequently a captain in the 8th Regiment Ohio Vols. Later, he was adjutant of the 34th Ohio infantry; was appointed assistant adjutant-general of volunteers by President Lincoln in 1863; served as such in the army of West Virginia, and was assistant adjutant-general of a cavalry division under Gens. Hunter and Sheridan in the campaigns of 1864. He was afterwards transferred to the staff of Maj.-Gen. W. S. Hancock, and became assistant adjutant-general of the Middle Military Grand Division, headquarters at Washington, D. C., and was transferred to Bal-

timore with Gen. Hancock when the latter assumed command of the Middle Department. In the beginning of 1866, the war being over, he left the army and entered the legal profession. He was admitted to the bar of the Supreme Court of the District of Columbia, and afterwards to the bar of the Supreme Court of the United States. In 1871 he was appointed assistant chief of the revenue marine, and, with Mr. S. I. Kimball, participated in the reorganization of the revenue marine service and the life-saving service. He was appointed chief of the revenue marine July 1, 1878. In addition to his duties in charge of this bureau, he is a member of the examining board of the Treasury Department, to examine applicants for admission and promotion to clerkships in the Department; also a member of the board designated by the Secretary of the Treasury to consider all matters pertaining to Alaska.

Clarty. Wet; slippery; dirty; sticky.

Clary, Albert G., Commodore U.S.N. Born in Massachusetts. Appointed, 1832; attached to sloop "Vincennes," Pacific Squadron, 1834–36; Naval School, New York, 1837.

Promoted to passed midshipman, July 8, 1839; sloop "Marion," Brazil Squadron, 1839–42; receiving-ship, Boston, 1843–45.

Commissioned as lieutenant, April 11, 1845; sloop "Preble," Home Squadron, during the war with Mexico, at Tuspan and Tabasco; sloop "Preble," Pacific Squadron, 1847–50; receiving-ship, Boston, 1852; sloop "Marion," coast of Africa, 1853; frigate "Constitution," coast of Africa, 1854–55; navy-yard, Portsmouth, N. H., 1856–57; steam-frigate "Minnesota," East India Squadron, 1858–59; steam-frigate "Colorado," 1861; commanding steamer "Anacostia," Potomac Flotilla, 1861; engagement at Acquia Creek, May 31 and June 1, 1861; battle of Port Royal, November 7, 1861.

Commissioned as commander, July 16, 1862; commanding steamer "Mount Vernon," North Atlantic Blockading Squadron, 1862; commanding steamer "Tioga," West India Squadron, 1863; commanding steam-sloop "Dacotah," North Atlantic Blockading Squadron, 1864; commanding steam-sloop "Seminole," West Gulf Blockading Squadron, 1864–65; commanding receiving-ship, Norfolk, 1866.

Commissioned as captain, November 21, 1866; commanding "Dictator," 1870–72. Commissioned as commodore, 1873; retired, 1874.

Clashy. Showery.

Clasp-hook. A clip-hook (which see).

Class. A group of objects, animate or inanimate, which possess common characteristics. A number of students of the same standing, or who are pursuing the same studies.

Classification of Men-of-War. *First-rates* will comprise steamships of 4000 tons displacement and upward; ironclad steamers of 3000 tons measurement and upward; ships-of-the-line commissioned for sea-service.

Second-rates will comprise steamships of 2000 to 4000 tons displacement; ironclad steamers of 2000 to 3000 tons measurement; frigates (sailing) commissioned for sea-service.

Third-rates will comprise steamships of 900 to 2000 tons displacement; ironclad steamers of 1200 to 2000 tons measurement; sloops-of-war (sailing) commissioned for sea-service.

Fourth-rates will comprise steamships below 800 tons displacement, dispatch-vessels, and store-ships.

Whenever a vessel is commissioned as a receiving-ship, her rate will be decided by the Navy Department.

Classification of Merchant-vessels.

		American Lloyd's.	British Lloyd's.	French Veritas.
1st Class.	1st Grade 1st Class.	A 1	A 1	3.3 1.1
	2d " "	A 1-	"	" "
	3d " "	A 1½	"	5.6 1.1
2d Class.	1st Grade 2d Class..	A 1½-	A 1 (in red)	5.6 2.1
	2d " "	A 2	*Æ 1 (in red)	" "
3d Class.	1st Grade 3d Class..	A 2-	Æ 1	3.4 2.1
	2d " "	A 2½	Æ 2	2.3 2.2

The degrees of first and second class will imply confidence for the transportation of perishable cargoes on long voyages. The degrees of third class will not imply confidence for the conveyance of cargoes in their nature subject to sea damage.

The classification of shipping depends upon the quality and dimensions of materials used, the equalization of strength in their distribution in scarfs, laps, and butts, with mode and extent of fastening. Model and manner of construction must accord with the best practice of ship-building, for all grades. The sparring must be in good proportion, and all equipments efficient.

The frame, head, and heels of timber must be square, and free from sap or decay; the timber well seasoned, salted or pickled when in progress of construction; ventilation preserved fore and aft; and a water-course made on under side of floors to admit the water to the pumps.

The frames must be of white oak, the principal timbers of live-oak or other timber of equal durability, and the tops of frames mixed with red cedar, hackmatack, locust, or white-heart chestnut. The butts must be distributed out of line; the timber scarfs not less than 4 feet 6 inches long; the floor timbers extending well towards the ends of the ship; the heels of the cants stepped in the dead-wood and bolted through with copper; the wing and main transom well kneed and connected to the frames.

The keel must be sided of sufficient size to admit of twice the thickness of the outside plank between rabbets on stem and stern-post, the rabbets to extend as far as practicable, to admit of fastening the wood ends thereto. The heel of stem must be a crook, and stepped in a hooked scarf on the keel, and not less than 3 feet 6 inches long. The stern-post must also be stepped in the keel.

Natural crooks are preferred for rising floors and second futtocks. The siding of timbers must be in proportion from floor-heads to heads of top-timbers; the distance at centres for all vessels of 800 tons and under must not be over 26 inches, and vessels over that tonnage not over 30 inches.

The keelson must be sided not less than size of keel, and the scarfs not less than 7 feet long; if single keelson, the shifts of scarfs to be at least one-third the length of the stick from the end of the scarf of the keel. In rider keelson the scarfs must not be less than six feet long; assistant keelson, if adopted, to be well bolted to first futtocks and to main keelson. The scarfs must be distributed so as not to be under the heel of a mast.

The beams must be of oak or yellow pine of

sufficient size and 6 feet from centres, except for hatchways, and securely fastened to the side by knees carefully fitted to the timber, natural crooks. The lodge- and bosom-knees must be of oak or hackmatack. Seasoned oak or hackmatack is preferred for hanging-knees; vessels of 200 tons are required to have a hanging-knee of wood or iron under each end of each alternate beam; if over 200 tons, to have a hanging-knee under each beam, the arms of good length, not less than 3 feet 6 inches; the knees to be fastened with through bolts driven from outside and clinched over rings, in addition to the blunt bolts driven from the inside, and each hanging knee must be keyed to the beam.

The breasthooks and pointers must be square-fastened, one-third of the bolts driven from the outside through the timbers and clinched over rings on the inside, and all blunt bolts must be driven within one inch of through. Copper or composition bolts must be driven through the apron and inner stern-post not over 20 inches apart and clinched over rings of the same material on the outside. Copper or composition bolts must be driven through the dead-wood 20 inches apart, passing through the heels and scarfs of stern and stern-post and clinched over rings on the outside and lower side of keel.

Spar-deck water-ways must be fayed to the beams and timbers, the scarfs vertical, and at least three planks next the water-way must be one inch thicker than the adjoining plank, and alternately let one inch into and one inch over the beams and carlines, the edge bolted through water-ways and timbers, and clinched. The main and inner water-ways on lower decks must be cogged to the beams with locust, bolted through each beam and clinched, and bolted from outside through each timber and clinched over rings. The clamps and inside planking must be of good length, the clamp-scarfs to be hooked or keyed, arranged to suit the timbers, and in length not less than five times the length of the plank. The ceiling must be of good quality, the butts properly shifted, the whole square-fastened, and the edges beveled to good calking seams. In all cases the nibs of the butt-scarfs must be one-third the width of the planks, and reach the frame forward and abaft of their centres.

The outside planking must be of white oak or yellow pine, and fit closely to each other on the inside. The garboard streaks must be, at least, from 3 to 1½ inches thicker than the rest of the covering. No butts in any part of the planking must be nearer than 5 feet of each other, unless there be a streak wrought between them, when a distance of 4 feet will be the minimum; all butts on the same timber must have 3 streaks between. Vessels under 200 tons are exempt from the full operation of this rule.

Deck-planks must be of white or yellow pine of best quality, and not less than 30 feet in length; no planks to be over 5½ inches wide and 3 inches thick, and fastened with two copper spikes in the butt of each plank; rail-scarfs must be hooked or keyed, and in length 5 times their width. Stanchions under deck-beams must be of oak or pitch-pine.

Garboards, first and second, must be bolted to the floors with copper or composition driven through each frame and clinched, and edge bolted through keel and each other in addition to treenailing. All bolts going into the timber must be driven within one inch of through, and the plank, well wrought to the timbers with copper or composition spikes, must be square-fastened with locust treenails of best quality driven through and wedged, outside and in; when the plank is 6 inches wide, then to be treenailed single and double in each frame; when 10 inches, to be square-treenailed. Each plank must be fastened with at least one headed copper or composition bolt driven through the first frame and aft the butt, and clinched over rings on the inside of ceiling.

Each alternate floor must be fastened to the keel with a copper bolt driven from above and clinched on the under side of the keel. The intermediate floors must be fastened with a copper bolt driven through the main keelson and clinched on the under side of the keel. If a "rider keelson" is added, it must be fastened with one iron bolt in each floor through the rider to within one inch of the lower part of the keel. The vertical bolting in the assistant keelsons to be driven through the first futtocks.

In calking, the seams must be well filled with oakum thread, 50 feet to the pound, and at least one thread to each half-inch of the thickness of the plank.

Ships exceeding 5 times their breadth in length should be iron strapped diagonally.

The timber used in all vessels must be free from sap and decay. The stem above the forefoot must be of one piece, or if scarfed, the scarf must be above light-water line. Stern-post must be of one piece. Scarfs of keel not to be under a mast. Bilge streaks to correspond to tonnage. Vessels of 800 tons and over should have a heavy stringer under the lower knees.

Channel-bolts must be driven through the frames and ceiling and clinched or keyed. The partial fastenings of ceiling and outside planking must be complete before the treenail holes are bored, and care should be taken not to split the plank in driving the treenails. The pumps of vessels must correspond to their tonnage, and be so distributed that they may free the ship from water at any time or inclination; the pump-well must be accessible at all times. Vessels when wormed will not be classed until defects are removed. All vessels must have anchors, cables, boats, compasses, charts, leads, lead-lines, etc. Vessels trading to ports beyond the Cape of Good Hope or Cape Horn must have two suits of courses, topsails, jibs, spankers, and fore-topmast stay-sails, and be metal sheathed within one foot of load-line. Other vessels should carry a spare topsail and fore-topmast stay-sail.

Vessels having two decks should have scuppers through the water-ways of lower deck. Vessels transporting dry cargoes should have their masts coated. Vessels over-sparred or deficient will not receive classification. Vessels whose bowsprits step below the spar-deck, or whose hawse-holes are cut below the spar-deck, are subjected to a lower classification.

New vessels are to be surveyed while building at the following stages: when the keel and keelson are united; when the frame is raised and the keelson in; when the deck frames are complete; when treenailed and butt and bilge bolted; when masted and fully equipped. When old vessels are examined for classification particular atten-

tion is directed to the state of the upper and main deck and coamings; the upper and lower deck bolts; the knees, beams, plank-shears, and water-ways; the hawse timbers, breast-hooks, aprons, transoms, floor, and keelsons; the rudder, keel, windlass, planking, and treenails; the frame exposed, and inner surface of planking. A listing should be taken out of the ceiling above floor-heads; also, a short plank taken out under each tuck, and at such other places as may seem necessary. The sheer and general line of the ship, and the condition of the oakum and calking, are examined.

Requirements for Grades of Classification.—Vessels properly constructed and equipped class A 1 for 12 years; if opened and bored at the expiration of that term and found sound, the class is continued for such a period as the surveyors may determine.

When vessels are built with floors of oak, birch, and beech, futtocks and top-timber of oak and hackmatack, covering of oak, scantlings of good size, and materials and workmanship first-class, they will receive the A 1 class 9 years, at the expiration of which, if found sound, the class will be continued for 3 years.

When vessels are built of mixed woods, such as birch, beech, elm, hackmatack, fir, pine, hemlock, spruce, etc., the treenails through ceiling and wedged outside and in, with butt bolts in plank, and all other parts fastened sufficiently, and deck frames secured by lodge- and hanging-knees, they will receive class A 1 8 years.

Ships with depth of hold exceeding 23 feet will be required to have orlop-beams, secured with horizontal and hanging knees; when exceeding 25 feet, to have three full decks. Single-decked vessels, with depth of hold exceeding 12 feet, to have partner-beams and secured with knees and masts wedged in partners.

Single-decked vessels, when built of standard materials, with depth of hold not exceeding 11 feet, the fastenings in accordance with the rules set forth, will receive the same class as double-decked vessels; when built of other materials, they will be classed in accordance with quality of materials and construction.

Centre-board vessels of superior construction, with oak frames and coverings, all fastenings first-class, moderately sparred, and the centre-board trunk well secured, will class A 7 years; when built inferior to this grade, they will be classed in accordance with quality of build.

Vessels having their centre-boards taken out will be required to have the floor timbers run across to meet the second futtocks, and chocks put in to meet the first futtocks.

When vessels are rebuilt or thoroughly repaired, they will be restored to original character if the materials used are equal to the original.

Iron Vessels. The classification of iron vessels depends on the quality of iron, mode of construction, dimensions of plating, frames, and angle-iron, the distribution of scarfs and butts, etc.

Neither steam- nor sailing-vessels must exceed seven times their breadth in length; the latter to have two bulkheads, and the former not less than four, and secured with angle-iron equal in size to that of frames; the distance of frames at centres must not exceed 20 inches.

The keel, stern, and stern-post must be of solid iron, the scarfs to be in length eight times the thickness of the material. Propeller-posts are required to be in thickness double that of keel, and to taper off along the line of keel; the whole to be well united.

Floor-plates must be fitted closely to the keel, riveted to every frame, and extend across the stern-post and above the bilges, that the sides may be properly connected. The depths of plate must be one-twelfth the depth of hold, measured from top of keelson to upper deck beams; and a water-course to be preserved to admit the water to the pumps. A reduction in size of plates will be allowed towards the ends of the vessel.

The keelson must be two-thirds the depth of floor-plates, and extend to stem and stern-post, and be connected thereto; the butts must be properly shifted, well fitted, and riveted to floor-plates. Angle-iron must be fitted on top and bottom of vertical plating, and riveted to the reversed angle-iron on top of floors. Additional keelsons are required for vessels of 800 tons or over.

The frames must be of the greatest possible length, the butts well shifted and fitted closely to the keel. The frames, if welded, must be perfect, and the whole strengthened with reverse angle-iron. All vessels must have double frames to above the bilges.

The beams must be one-quarter of an inch in depth for each foot of length of midships beam. The angle-iron must be of good size, the two sides of each not less in breadth than three-fourths the depth of beam-plate. The beams to be all well connected to the frames with bracket ends of knee-plates equal in thickness to beams, and the arms to be three times the depth of beams.

In vessels having three decks, the beams must be over each other, and stanchioned where practicable; the orlop-beams must be fastened to every sixth frame, and have stringer-plates and angle-iron on their ends fore and aft. Vessels of 20 feet depth must have the same number of hold and deck beams. A depth of hold of 16 feet must have beams to every fourth frame, and secured with knee-plates and to stringer-plate at under side.

All vessels must have stringer-plates on each tier of beams, connected at ends with angle-iron, and also to frames and outside planking. The clamps must be equal in dimensions to the stringers, and riveted to each frame. The tie-plates must be well riveted to each other, and to beams, hooks, and transoms, and the butts well shifted. When the deck arrangement will admit of it, all vessels are to have diagonal tie-plates. The hatchways, mast-holes, and partners must be strongly framed and secured with angle-irons and carlines.

All butts must be double riveted, and the plating closely fitted to the frames and to each other, and no plate less in length than 5 spaces of frames; a reduction in length and size of plating will be allowed toward the hood ends. The edges and butts must be well fitted and water-tight, the butts well supported to receive the plating, and united by straps of the same thickness as the plating, with the fibres of each in the same direction. The frame must have solid filling or lining pieces, closely fitted in one

length of the same breath as frames. In screw-vessels no reduction in plating towards the ends is allowed.

Rivets must be of the best quality of iron, the rivet-holes equally spaced and carefully punched, and to be countersunk through the outer plating. The rivets must be at least their diameter from the edge of plating, lining pieces, or any angle-irons, and distant from each other 4 times their diameter; all edges of horizontal joints of outside plating must be double-riveted throughout.

The main piece of the rudder must be of wrought iron. The ceiling must be of a superior quality, in thickness from 2 to 3 inches, and secured so as to be detached when required.

The decks and water-ways must be equal in thickness to wooden vessels of corresponding tonnage, and fastened with screw-bolts two in each plank, in every beam, the water-ways fastened with screw-bolts, and secured at under side of stringers.

Bulkheads must be made water-tight where ties, stringers, or screw-shafts pass through, closely fitted between two frames at each side, and riveted through them, the whole well supported by angle-irons 30 inches apart, and riveted together and to the floors, beams, and frames, etc. A pump must be fitted to each compartment. Iron vessels are required to have the same equipments as wooden vessels of corresponding tonnage.

Steam-vessels. The classification of steam-vessels depends on the construction of the hull and the character and condition of machinery.

In the construction no departure from the standard rules will be admitted. The scantlings and dimensions must be regulated in proportion to capacity, to insure longitudinal strength. The floor must be filled in solid as high up as the turn of the bilge. The frame must be diagonally iron strapped from the floor-heads to the upper deck beams, and bolted to each timber; and when double laid, riveted in each timber room.

There must be water-tight bulkheads, 30 to 50 feet from stem and stern, to reach at least two feet above deep load-line, which must be well secured to strong stanchions on the after-side. Steam-vessels engaged in the transportation of passengers are required to have sufficient life-boats. Steam-vessels navigating the ocean or coast, are required to have a sufficient spread of canvas to make a port in case of derangement of machinery. All steam-vessels' bottoms are to be examined annually, and are required to be opened for inspection at the expiration of 5 years, to ascertain the condition of their frame.

Sea-going steamers of standard construction, and having sufficient canvas to make port in case the machinery is disabled, rate A 1*.

Sea-going steamers with but little canvas, rate A 1.

Steamers constructed for navigating sounds, lakes, and rivers, rate A 1 to A 2.

Claw Off. To work to windward from a lee shore; particularly when the operation is performed under difficult circumstances.

Clayborne, William. A surveyor by profession. Authorized by the rulers of Virginia to discover the limits of Chesapeake Bay, he pursued his investigation with great ardor between the 34th and 41st degrees of latitude, in 1625. A company having obtained the royal license to trade with the Indians, Clayborne was placed at the head of an expedition, and leaving England with a number of persons disposed to settle in Virginia under his government, he planted a colony on Kent Island, in Chesapeake Bay.

Cleaching Net. A hand-net with a hoop and bar, used by fishermen.

Clean. Free from danger; as, a clean coast, a clean harbor, etc. In general parlance it means quite, entirely.

Clean Bill of Health. See Bill of Health.

Clean Done. Adroitly tricked; purpose well effected.

Clean-full. Rap full; applied to the sails.

Clean off the Reel. When the ship is going so fast as to take the log-line off the reel without its being fed to her, she takes the line *clean off the reel.* The expression is used for anything that is done without stop or hindrance.

Clean Ship. A whale-ship unfortunate in her trip, having no fish nor oil.

Clear. A word applied to many different objects, and its signification is generally opposed to *foul. To clear* a rock, vessel, or point, to get by it without touching. *To clear* a time-glass, to let all the sand run out of one end. *To clear* a rope, to remove any obstruction to its running freely. *To clear* a lighter, to discharge its cargo. *To clear* goods, to pay duties and go through the formalities required by the custom-house officials. *To clear* is to present the proper documents and receive permission of the proper authorities to sail. *To clear* the decks is to send or drive the men off from them. *To clear up* the decks is to lay up the ropes and put everything in its place. The weather *clears up* when the clouds break away, and there is a prospect of a return of fine weather. *To clear away* a rope is to let go the end of it. *To clear for action,* to prepare for battle. *To clear the land,* to gain such a distance from the land as to have plenty of sea-room.

Clearance. A document from the custom-house certifying that the ship has cleared; permission to sail.

Clearing the Distance. The operation of deducing the true from the apparent lunar distance.

Clear Water. Water free from obstructions, as ice, rocks, etc.

Cleat. A piece of wood or metal bolted to the side or deck to which a rope is belayed. *Cleat* is also the name given to a wedge-like piece of wood nailed on a spar to keep the rigging from slipping in or down. *To cleat* an object is to nail cleats against it to keep it from slipping.

Clench. See Clinch.

Clerk. A civilian appointed by the officer who is entitled to his services; as, captain's and paymaster's clerk. He is required to be at least 18 years old, and to serve until regularly discharged. A clerk is a steerage officer, but the captain's clerk sometimes messed with the commanding officer, in which case he was not entitled to quarters in the steerage. The commanding officer is not now entitled to a clerk, his duties being performed by one of the junior officers attached to the vessel.

Cleveland, a port of entry and second city of Ohio, is situated on the south shore of Lake Erie, at the mouth of the Cuyahoga River,

which flows through the city, affording a fine sheltered harbor, to which has been added a commodious ship-channel 200 feet wide, flanked by two piers extending 1200 feet into the lake. A harbor of refuge, commenced in 1878, is also in course of construction by the U. S. government, extending from a point northerly from the west pier, and running west by south to the lake-shore. The work is under the supervision of an army engineer, and is estimated to cost $1,800,000. Lat. 41° 30′ 5″ N.; lon. 81° 42′ 6″ W. Pop. 160,000.

Clew. The combination of nettles by which a hammock is suspended. The ordinary clews are plaited for a short distance below the ring or eye; *Spanish clews* are served without being plaited; triangular spans and iron rings have been used to give spread to hammocks, but they do not give satisfaction. One of the lower corners of a square-sail, or the after lower corner of a fore-and-aft sail. *From clew to earing*, literally, the diagonal of a square-sail; figuratively, from top to bottom; entirely; as, to shift one's clothes from clew to earing. *A clew up*, a case of despair. *To clew down*, to haul on the clew-lines and force a yard down. *To clew up*, to run the clews of a sail up to the yard.

CLEW-CRINGLE. A cringle in the clew of a sail to which the sheet is bent. In our service *clew-irons*, or *spectacle-irons*, are used instead of rope cringles.

CLEW-GARNET. A rope by which the clews of the courses are run up to the lower yards.

CLEW-GARNET BLOCK. A large, single, iron-bound block at the slings of the lower yards, to act as a leader for the clew-garnet. Also the block at the clew of the sail through which the clew-garnet reeves.

CLEW-IRON. The iron shackle in the clew of a sail to which the sheet is bent. The iron is galvanized, and has two eyes with thimbles inserted; the round shape of the iron and the position of the two eyes give it the appearance of a pair of spectacles; hence the name *spectacle-iron*, which is sometimes applied to it. The objection which is sometimes made to the use of clew-irons is that they may iron-mold the canvas. They are stronger than rope and when galvanized do not rust for a long time, and when the sail is worn out they may be galvanized afresh and put in a new sail. They are universally used in the navy.

CLEW-JIGGER. A temporary purchase for hauling up the clews of courses and topsails forward of and above the yard; they are not used at sea. The fore clew-jigger is also used as the inner halliards of the lower stun'sail, and both fore and main clew-jiggers are used as reef-tackles.

CLEW-LINE. A rope by which the clews of all square-sails except courses are run up to their yards.

CLEW-LINE BLOCK. The block at the clew of a topsail through which the clew-line reeves. Formerly, the quarter-block was called a clew-line block.

CLEW-ROPE. The roping at the clew of a sail. A rope leading from the clew of a trysail to the jaws of the gaff.

Click. A small pawl.

Cliff. A precipitous termination of the land. See CRAG.

Clinch. A kind of hitch, in which the end of a rope is taken around the standing part and seized to its own part. In the *inner* clinch the end is inside of the other part, and in the *outer* clinch the end part is outside. The seizings are called *bends*. *To clinch* a rope is to secure the end of it by means of a clinch. *To clinch* a bolt is to rivet the end of it over a ring or plate. *To clinch* a bargain is to settle it beyond further dispute.

CLINCH-BOLT. A bolt, the end of which is turned over by hammering.

CLINCHER. An incontrovertible argument.

CLINCH-NAILS. Nails made of malleable metal, as copper, wrought iron, etc., whose ends may be turned back.

Clinch-built. See CLINKER-BUILT.

Clincher-built. See CLINKER-BUILT.

Clincher-work. See CLINKER-WORK.

Clinker-built. A term to denote that the planks of a boat overlap. When the plates of iron vessels overlap they are distinguished as *lap-jointed*. See CLINKER-WORK.

Clinker-work. Lap-jointed work. A mode of building in which the lower edge of each plank laps over the upper edge of the plank next below. This method of building is employed in boats of light construction, and sometimes in iron ships.

Clinton, George, Admiral. Governor of New York, September, 1743–October, 1753. Died governor of Newfoundland, July 10, 1761. Youngest son of Francis, sixth earl of Lincoln. Appointed commodore and governor of Newfoundland, 1732. Subsequently appointed governor of New York. His want of skill in civil affairs peculiarly exposed him to the tumults and commotions of colonial government. In his controversies with the assembly Colden, afterwards lieutenant-governor, was his champion with the pen; his chief opponent being Horsemander. Clinton afterwards became governor of Greenwich hospital; in 1745 became vice-admiral of the red, and admiral of the fleet in 1757.

Clip-hook. A hook composed of two parts moving on the same pivot. When hooked and moused these two parts form a solid hook, and cannot be separated until the mousing is removed.

Clipper. A long, low, sharp, fast-sailing ship.

CLIPPER-BUILT. Built on the model of a clipper.

Clitz, John M. B., Rear-Admiral U.S.N. Born in New York, March 10, 1823. Appointed from Michigan, August 12, 1837; attached to sloop "Ontario," West India Squadron, 1838–42; Naval School, Philadelphia, 1843.

Promoted to passed midshipman, June 29, 1843; sloop "St. Mary's," Mediterranean Squadron, 1844–45; sloop "Falmouth," Home Squadron, 1845–46; bomb-brig "Hecla," Home Squadron, 1847; capitulation of castle of San Juan d'Ulloa and capture of Tuspan; steamer "Petrita," Home Squadron, 1847–48; frigate "Cumberland," Mediterranean Squadron, 1849–51.

Commissioned as lieutenant, April 6, 1851; Coast Survey, 1851–52; steam-frigate "Mississippi," East India Squadron, 1852–55; special duty, Washington, 1856; sloop "Decatur," Pacific Squadron, 1858–59; steam-sloop "Iroquois," 1861.

Commissioned as commander, July 16, 1862; commanding steamer "Penobscot," North Atlantic Blockading Squadron, 1863; commanding steam-sloop "Juniata," East Gulf Blockading Squadron, 1863; commanding steamer "Osceola," North Atlantic Blockading Squadron, 1864–65; at both attacks on Fort Fisher; navy-yard, Boston, 1866.

Commissioned as captain, July 25, 1866; commanding steam-sloop "Pawnee," South Atlantic Squadron, 1868–69; ordnance duty, navy-yard, New York, 1870; commanding "California" (second-rate), Pacific Fleet, 1870–72.

Commissioned as commodore, December 28, 1872; commanding naval station, Port Royal, S. C., 1876–77; light-house inspector, 1878–80; commissioned as rear-admiral, 1880; under orders to command East India Squadron.

Clive. An old spelling of *cliff.*

Clock, Astronomical. A pendulum clock of superior construction and specially adapted for astronomical observations. It is adjusted to show sidereal time, and indicates $0^h\ 0^m\ 0^s$ when the first point of Aries is on the meridian. It is regulated by observing with a transit instrument the meridian passage of the heavenly bodies. The astronomical clock furnishes the best means of rating a chronometer.

CLOCK, MEAN SOLAR. A clock which indicates *mean solar* or *civil time.* See TIME.

CLOCK, SIDEREAL. A clock which indicates *sidereal* time. See TIME.

CLOCK-STARS. A name for the nautical stars (which see).

Clock-calm. Dead calm; not a breath of air stirring.

Clod-hopper. A clownish landsman.

Close. Near. To draw near.

CLOSE ABOARD. Near the ship.

CLOSE BUTT. A shipwright's definition of a close butt is, a butt of a half-way piece either in the outside planking or the deck of a vessel, not intended to be calked. Before this piece is put into position the seams and the butts of the said half-way pieces are made tight or close for appearance only.

The calker's definition of a close butt is, one that cannot be properly calked without cutting, whereas a proper open butt involves no extra expense, and leaves a smooth edge for the formation of a perfect oakum wedge.

CLOSED PORT. An interdicted or blockaded port.

CLOSE-FIGHTS. See CLOSE-QUARTERS.

CLOSE-FISTED. Stingy; penurious.

CLOSE HARBOR. An artificial harbor with an entrance which may be opened and closed at will.

CLOSE-HAULED. The situation of a ship when her yards are braced up sharp and she is sailing as close to the wind as possible. The after-yards should be braced in a little more than the head-yards, and the upper yards a little more than the one next below, in order that the after-sails may lift before the sails on the fore, and the light sails before the courses and topsails. The helmsman steers by the weather-leech of the upper sail on the main.

CLOSE PACK. See PACK-ICE.

CLOSE PORT. A port which lies up a river, in contradistinction to an *out-port.*

CLOSE-QUARTERS, or CLOSE-FIGHTS. In olden times heavy bulkheads or barricades, fitted with loop-holes, were erected, and the crew retreated to this place when they were unable to drive the enemy's boarders back. The fight was then carried on from inside the barricade. The term, which was then confined to these hand-to-hand combats, is now applied to a fight at short range between ships.

CLOSE-REEF. The last reef in a sail.

CLOSE-SIGHT. The notch in the base-ring of old guns.

CLOSE TO THE WIND. As near the wind as possible without causing the sails to lift.

CLOSE WITH. To approach; as, to close with an enemy.

Cloth. A general term for the sails of a ship. Canvas is wove in *cloths* or breadths, and the width of a sail is denoted by the number of cloths it contains.

CLOTH IN THE WIND. Too near the wind; sails lifting. Also, half intoxicated.

Clothed. The lower masts are said to be *clothed* when the courses have a great deal of *drop.* A ship is *clothed* with canvas when she is carrying all sail.

Clothes-line. A system of parallel lines on which the men's washed clothes are stopped to dry. The harbor-lines extend from the bowsprit to the spanker-boom, and are triced well up to the lower yards. The sea-lines extend from the main to the mizzen rigging.

Clothing. The rigging of the bowsprit. *To clothe* the bowsprit, to rig it.

Cloud. Clouds are masses of visible vapor or watery particles suspended in the atmosphere. A cloud, motionless or nearly so, lying at or near the surface of the earth, receives the name of *haze, mist,* or *fog,* according to its density. The term *scud* is applied to loose vapory fragments of clouds driven by the wind.

The formation and height of clouds vary with the amount of vapor in the air, the course and height of air-currents, the climate, season, temperature, extent of sea and land, and the height of the land. Cloud-strata in mountains vary from 1600 to 3400 feet. Remarkable cloud-rings prevail over the calm zones of the equator, and over those of the tropics of Cancer and Capricorn. Kaemtz regards the usual height of cirrus to be 10,000 to 24,000 feet; cumulus, 3000 to 10,000; nimbus, 1500 to 5000; but cirrus may descend to 2000 or 3000 feet, and nimbus to within a few hundred feet of the earth.

Clouds moderate the sun's rays during the day and the earth's radiation at night; they are the source of moisture required by plants; of the water for springs, lakes, and rivers; and of the polar, glacial, and winter snows.

The scale adopted for indicating the amount of cloud is 0 to 10,—0 denoting a clear sky, 5, a sky half covered, and 10, the sky overcast or wholly obscured.

In 1802, Howard proposed the following classification of clouds, which has been universally adopted: *cirrus, cumulus, stratus, cirro-cumulus, cirro-stratus, cumulo-stratus,* and *cumulo-cirro-stratus,* or *nimbus.*

Cirrus, or curl-cloud, consists of streaks, wisps, and fibres. It is the highest and least dense of clouds; varies most in extent and shape; retains longest its outlines; and is illuminated longest after sunset and before sunrise. Cirrus seems to arise from the mixing of parallel air-currents, or

are the relics of dissolving clouds drawn out by the wind. Cirrus being so high must consist of minute snow-crystals, whose refractions and reflections produce the halos, coronæ, and mock suns and moons almost restricted to this cloud, and its derivatives, the cirro-cumulus and cirro-stratus.

Cumulus, day-, or summer-cloud, consists of dense, convex, hemispherical, or conical heaps of cloud piled or stacked on each other. Cumulus begins after sunrise as a few scattered specks in the clear sky; these specks increase and unite to form clouds, which sometimes cover the whole sky in the afternoon, and generally decrease and vanish about sunset. The tops of these clouds become cirrus in very dry air.

Stratus, fall-, or night-cloud, the lowest of clouds, is a widely extended horizontal sheet of varied thickness. It is common in summer and autumn from sunset to sunrise, and is densest about midnight. After sunrise it generally rises from the ground, breaks up into cumulus, and vanishes with the increasing heat; sometimes it accumulates in layers and becomes nimbus. Stratus does not wet objects which it touches, and thus differs from a variety, cirro-stratus, of like external aspect.

Cirro-cumulus, or sonder-cloud, is composed of well-defined, small, rounded patches, or woolly irregular tufts at great heights. It often has the appearance of flocks of sheep at rest ("sheep in a meadow"), and is commonly known as the "mackerel sky." It may vanish or pass into cirrus or cirro-stratus. It often occurs in warm dry weather.

Cirro-stratus, or vane-cloud, consists of long thin layers with undulated edges. It often assumes a barred appearance, or resembles a shoal of fish. The cloud partakes of the nature of the cirrus and stratus. In distinguishing it, attention must be paid not so much to the form as to the structure, which is dense in the middle and thin towards the edges.

Cumulo-stratus, or twain-cloud, is a cirro-stratus mixed with cumulus heaps, or a wide, flat base surmounted by a bulky cumulus with fleecy protuberances. It is much denser than cumulus, though the air is not dry enough to round off sharply its tops. It often forms vast banks with overhanging masses, and is common towards night in windy weather, when it has a leaden hue. It generally arises from cumulus, and tends towards nimbus.

Nimbus, or cumulo-cirro-stratus, the rain-cloud, is a mixed system of clouds, ending in rain, snow, or hail. It is a dense, continuous, horizontal block, or gray sheet, with fringed edges, a cap of cirrus, and cumulus on the sides and below. Before rain, vast towering masses of cumulus often pass on to cumulo-stratus, which, increasing in density, darkness, and extent, become nimbus capped with cirro-stratus.

In Admiral Fitzroy's system there are four primary classes of clouds, viz.: cirrus, stratus, nimbus, and cumulus. He combines these words to describe the intermediate modifications, and renders the terms more explanatory by the use of the terminations *onus* and *itus;* as, *cirronus, cirritus, cirrono-stratus, cirrito-stratus*, etc. See WEATHER.

CLOUDS, MAGELLANIC. Two nebulæ situated near the south pole.

Clout. A blow. A gore of blood. A chafing-plate on the arm of the axle of a wooden gun-carriage.

CLOUT-NAILS. Nails with which piles and ships' bottoms were studded before the introduction of copper sheathing.

Clove-hitch. Two half hitches, in which the end parts come out parallel with, and opposite to, each other.

Clove-hook. See CLIP-HOOK.

Cloy. To spike (which see).

Club. To drift down a current with an anchor out. Vessels drifting in this manner generally have a spring from the quarter to the ring of the anchor, by which they can be sprung broadside to the current. The objection to this manœuvre is the probability of fouling the anchor.

To club a fleet is to manœuvre so as to place the first division to windward.

Clubbock. The spotted blenny, or gunnel (*Gunellus vulgaris*).

Club-haul. In clawing off a lee shore when there is no room to wear, and therefore an absolute necessity for going about without running the risk of missing stays, the ship is *club-hauled*. The lee anchor is got ready for letting go, and a hawser is bent to it and taken to the lee quarter. Proceed as in tacking; if she goes around, so much the better. If, however, it is evident that she will not go round, let go the anchor when the headway ceases, and brace around the after-yards. When she swings to the anchor the wind will be ahead or perhaps a little on what was the lee bow. Haul in the hawser and make it fast; veer chain, and when the hawser has the strain, slip the cable; when the after-sails fill, brace around the head-yards and cut the hawser. This manœuvre is attempted only when absolutely necessary, as it results in the loss of an anchor, and a part of a cable and hawser.

Clubs, British Service. At every important naval and military station of the British empire are to be found service clubs, whose members are officers on duty at those places, but the leading British service clubs are in London, and we give them according to their date of formation.

The Guards Club, 70 Pall-Mall, was founded in 1813 for the officers of the three regiments of Guards. January 1, 1880, it contained 357 members. The entrance fee is 30 guineas, and the yearly subscription 10 guineas.

The United Service Club, 116 Pall-Mall, was founded in 1815 for senior officers of the army, navy, and marine corps; the limit is major in the army and marines and commander in the navy. January 1, 1880, it contained 1550 members. The entrance fee is £40, and the yearly subscription 7 guineas.

The Junior United Service Club, Charles Street, St. James' Square, was founded in 1827 for officers of all grades in the army, navy, marines, and militia. January 1, 1880, it contained 2000 members. The entrance fee is £40, and the yearly subscription 7 guineas.

The Army and Navy Club, 36 Pall-Mall, was founded in 1838 for officers of the army, navy, and marines of all grades. January 1, 1880, it contained 2342 members. The entrance fee is 40 guineas, and the yearly subscription 10 guineas.

In 1838, Sir Edward Barnes and other officers, just arrived from India, finding that from the lists of candidates for the United Service and

Junior United Service Clubs it would be several years before they could obtain admission, concluded to start an Army Club, and asked the Duke of Wellington to be the president. He declined unless the navy and marines were admitted. That being agreed to it was founded. The Duke of Wellington was the first president. He was succeeded by the Duke of Cambridge. At the death of the latter the present Duke of Cambridge was elected, and is still the president. The club occupied temporary quarters in King Street, St. James' Square, until the present building was completed, in 1854.

The Naval and Military Club, 94 Piccadilly, was founded in 1862 for officers of the army, navy, and marines of all grades. January 1, 1880, it contained 2000 members. The entrance fee is 35 guineas, and the yearly subscription 8 guineas.

The Junior Army and Navy Club, 12 Grafton Street, was founded in 1871 for officers of all grades of the army, navy, and marines. January 1, 1880, it contained 800 members. The entrance fee is 10 guineas, and the yearly subscription 7 guineas.

The Royal Artillery and Engineers' Club, 3 Pall-Mall East, was founded in 1873 for officers of the artillery and engineers. January 1, 1880, it contained 400 members. There is no entrance fee, and the yearly subscription is 3 guineas.

The Junior Naval and Military Club was re-founded in 1879 at 27 Dover Street, Piccadilly, for officers of all grades of the army, navy, marines, and militia. It was established first, in 1875, as a proprietary club on Pall-Mall, but the failure of the proprietor in 1879, and other causes, —the principal one of which was to eliminate objectionable members,—caused it to be re-established at the present address. January 1, 1880, it numbered over 500 members, and no limit was fixed. The entrance fee was *nil*, and the yearly subscription 8 guineas.

The East India United Service Club, 14 St. James' Square, was founded in 1847 for officers of all grades in the East India service, both military and naval. January 1, 1880, it contained 1200 members. The entrance fee is 30 guineas, and the yearly subscription 8 guineas.

The United Service, Junior United Service, and Army and Navy Clubs occupy perfect palaces, which were built especially for them. The Naval and Military occupy the house of the late Lord Palmerston, and their proximity to Hyde Park and outlook on Green Park gives them the finest location in London. They have been recently doing up their club-house, which compares well with the first three mentioned. They have a long lease on the club-house, whereas the other three mentioned own the buildings, and two of them the ground.

The Guards own their club-house, the others lease the buildings. The appointments of all the service clubs in London are first-class. The *cuisine* is the best, the servants who wear the club liveries are attentive, polite, and well trained. Every comfort of a home is to be found in them, and some who live in London merely take lodgings near their clubs, where they spend unoccupied time. The rules and regulations of the service clubs are strict and enforced, yet so framed as to be a protection to the individuality of each member. Socially, they rank at the head of the ninety-odd London clubs, and expulsion from them, as well as other London clubs, means a social disgrace. The number of candidates for admission is always large, and generally five to seven years elapse between proposal and election. In the Army and Navy Club, which always has a large list, as long as twelve years occasionally happens; their average is about eight to ten years.

Military and naval *attachés* of foreign governments, and also the diplomatic corps, are honorary members, while in Great Britain foreign officers can also be elected as such for three months and extension by the club committee, provided they are regularly proposed and seconded. The oldest club in London is White's, founded in 1730. The diplomatic club is the St. James', 106 Piccadilly. The leading social club is the Marlborough, on Pall-Mall. Officers of the army and navy are eligible to election at nearly all the London clubs. Gambling is strictly prohibited at all the London service clubs; for any games the limits of the wager are fixed at a small amount. The experiments of a ladies' and gentlemen's club are tried successfully at the Albemarle, 25 Albemarle Street, and the Russell, 316 Regent Street.

There are no exclusively service clubs in France. French officers in garrison towns generally make one of the *cafés* a resort similar to a club. There is a navy club at Cronstadt, in Russia, and the Guard's Club at St. Petersburg.—*H. T. Stockton, Lieutenant U.S.N.*

Clue. See CLEW.

Clump-block. A short, thick, single block with a metal sheave.

Clutch. A forked stanchion. The oyster-spawn adhering to stones, oyster-shells, etc.

Cluttery Weather. Weather inclined to be stormy.

Co. An abbreviation of *complement;* as, co-latitude, co-sine, etc.

CO-ALTITUDE. The complement of the altitude, or the *zenith distance.*

CO-DECLINATION. The complement of the declination, or the *polar distance.*

Coach, or Couch (*Obs.*). An apartment in a large ship-of-war near the stern was formerly called a "coach." The floor of it was formed by the aftermost part of the quarter-deck, and the roof of it by the poop. It was generally the habitation of the captain.

An apartment before the captain's cabin.

Coach-horses. The picked men who man the barge.

Coach-whip. The narrow pennant.

Coak. To place pieces of hard wood, either circular or square, in the edges or surfaces of any pieces that are to be united, to prevent their working or sliding over each other. A small piece of hard wood or dowel used in coaking.

Coal. A word formerly applied to any substance which was used as fuel. Thus, Sir John Pettus in his "Fodinæ Regales," published in 1660, mentions two kinds of "coale": black, such as is burnt or "charkt"; and white, which is only baked in an oven to make it dry for "fewele." The two substances here mentioned are evidently charcoal and white or uncharred wood, so that with this author "coale" means wood fuel. Mineral fuel, however, has now so long and justly ranked first among fuels that

the word coal has come to be applied to that substance alone.

Coal is found in beds or strata in that group of the secondary rocks which includes the red sandstone and mountain limestone formations, and which is commonly called the *Carboniferous group*, or *coal-measures.* From the peculiarities of their deposition they are often spoken of under the names of *coal-basins* and *coal-fields.* The vegetable origin of coal is evidenced both by its chemical composition, the elements of which, viz., carbon, oxygen, hydrogen, and a small proportion of nitrogen, are precisely analogous to those of all vegetable organic compounds, and by the fact that vegetable tissue is obvious either to the unaided eye or under the microscope in nearly every species of coal formation. There has been considerable difference of opinion as to the mode of deposition of the coal strata, some holding that they have been deposited by the action of water in bringing down drift-wood, others adopting the theory proposed by Dr. Mohr, that they are of marine origin and have been formed by the carbonization of sea-weeds, such as the great kelp plant of the Pacific, while the still more generally received opinion is that they are the result of the transformation of plants on the site of their growth. This latter theory seems to be verified by the fact that all coal strata rest on old soils, and practically consist of nothing but vegetable matter. The abundance of roots shows that the soils supported a luxuriant growth of plants, and these, as they died and fell to the ground, would supply exactly the material for the production of coal. Prominent among the vegetable fossils contained in the "under-clay," or "seat-stones," on which the coal seams rest, are certain long, cylindrical branching bodies called *Stigmaria.* These lie horizontally in the underclay, and their filaments run out in all directions, till the clay is often one thickly matted mass of them. They were long generally accepted as being the roots of a plant called *Sigillaria*, often found fossil in the coal-measures, though Stigmaria had never been found actually attached to Sigillaria. It was reserved for Mr. Binney to supply this missing link in the evidence. He discovered in a railway cutting a number of trunks of Sigillaria standing erect as they grew with roots still attached to them. The roots were Stigmaria, and the rock into which they struck down, which was of course the soil on which the trees grew, was the seat-stone of a thin seam of coal. This discovery seemed to render complete the proof that the herbs and trees of which coal is formed grew on the areas where the coal now occurs. One variety of coal —cannel—forms probably an exception to the general rule here stated. The presence of fossil fish in cannel-coals shows that they must have been formed under water, and they probably consist of vegetable matter which was drifted down into ponds or lakes. They always occur in dish-shaped patches, thinning away to nothing on all sides.

Vegetable matter undergoing decomposition, freely exposed to the action of the air and rain, passes into a dark-brown, moldy substance known to chemists under the name of *Humus* or *Ulmin;* but the process of decomposition does not stop with the formation of humus; the transformation, which mainly consists in the gradual elimination of the oxygen and the concentration of the carbon, still proceeds, and results in the composition of the organic substance of *peat*, which is largely made up of altered humus, generally, although not altogether, derived from the decomposition of the vegetable matter of mosses. Peat varies in external character and chemical composition with its age and position in the beds in which it is found. The upper layer is light in color and soft and spongy in texture, and its vegetable origin is obvious even on the most superficial inspection. Deeper down in the bog the layers become darker and are more strongly pressed together, the vegetable structure becomes less and less apparent, until near the bottom of a deep bog the peat is almost black, has a density nearly equal to that of coal, and requires rather careful scrutiny to detect any organized structure. The chemical composition of the moss alters with this change in outward character; the relative proportion of the oxygen steadily diminishes, whilst that of the carbon as steadily increases. The altered vegetable matter now passes into a form analogous to that met with in *Lignite*,—a dark-brown, somewhat friable substance, of a compact, woody texture. As this woody texture disappears the substance passes into *brown coal*, which contains a still larger percentage of carbon and a smaller percentage of oxygen than the true lignites. From the brown coal we pass by insensible gradations to the black coal, or coal proper. The change is attended by an absolute loss of ligneous structure, by an increased density, and a tolerably well developed cubical fracture. When finely powdered most black coals show more or less of a brown color in proportion corresponding to the amount of oxygen which they contain. The softer varieties of these black coals are usually classed as *bituminous* coals,—a term which is founded on a misapprehension, for there is nothing, strictly speaking, of the nature of bitumen in them. Some coals when thrown on the fire seem to fuse and swell up; these are technically known as *caking* coals, in contradistinction to the dry, or free-burning coals, which retain their shape, but tend to split into columnar fragments. The cause of this difference is not clearly made out. It is certainly not dependent on ultimate composition, for two varieties of coal occurring in the same bed may have the same proportions of elementary constituents and yet behave very differently on heating. Many coals lose their power of caking by long exposure to the air; but, on the other hand, the slack of non-caking coal may often be made to fuse together into a compact mass if heated suddenly.

The blacker and harder varieties of coal gradually merge into the kind known as *stone* coal, or *anthracite.* Anthracite has a brilliant lustre; is denser, harder, and more brittle than ordinary bituminous coal, and has a conchoidal fracture. It ignites with difficulty, and gives out little flame on burning, owing to the non-formation of volatile hydrocarbons. The manner in which anthracite has been formed has given rise to much discussion. The general opinion is that it is simply bituminous coal modified or altered by heat. The evidence on this point is, however, far from being conclusive. Many coals tend to become anthracitic by simple exposure to air at ordinary temperatures. It has also been observed

that coal in the vicinity of open faults, or immediately below a sandstone roof, alters in texture, loses its cubical fracture, and is more highly carbonaceous than the ordinary bituminous varieties. Hence it must not be supposed that anthracite is necessarily the oldest because it is the most altered form of coal. There are coal-basins in which the coal is of the same age throughout, while in one part it is of the ordinary bituminous kind and in another part anthracite.

The essential conditions for the formation of the coal strata would seem to have been:

1. A luxuriant vegetable growth on the site of deposition.

2. A gradual subsidence of the area covered with the vegetable deposit beneath a shallow sea, during which beds of sediment—sand or clay—were deposited on top of it.

3. A re-elevation of the submerged area, and a repetition of the processes of growth, deposition, subsidence, sedimentary deposits, and emergence.

We have no means of knowing, even approximately, what amount of woody fibre would be required to make coal. Mohr has calculated that the transformation is attended with a loss of 75 per cent. in weight, and that when regard is had to the density of the two substances, the volume of the coal is only about one-twelfth of the woody matter from which it has been derived, but the data for such computations are not very trustworthy.

Attempts have been made by Cagniard de la Tour, Rivière, Daubrée, and others to imitate by heat the mode in which coal has been produced from wood. According to Baroulier, vegetable matter, such as sawdust, twigs, stalks, and leaves, imbedded in moist clay and heated from 200° to 300° C. for some time, yields a carbonized mass very similar to some varieties of coal.

Let us now briefly glance at coal as a source of power. The foot-pound, by which is meant the amount of work necessary to raise a pound in weight through a foot of space, may be taken as a convenient unit by which to measure the energy of heat in the production of power. The brilliant researches of Joule, Weber, and others inform us that (in round numbers) 772 foot-pounds of work are necessary to produce a unit of heat, and conversely, that a unit of heat, if entirely used up in the production of mechanical work, will perform 772 foot-pounds. From various experiments made on the calorific power of coal, it has been deduced that a pound of good coal in the state in which it is ordinarily used gives out during combustion about 14,000 units of heat. By multiplying the number of units of heat produced by the combustion of a pound of coal by 772 we obtain the number of foot-pounds of work to which the heat is equivalent. By this rule the average mechanical value of a pound of coal is $14,000 \times 772 = 10,808,000$ foot-pounds,—in round numbers 10,000,000 foot-pounds. The following table gives the number of foot-pounds of work which can be done under favorable conditions by a man and a horse, together with the number of pounds of coal the combustion of which would produce the same amount of work. The result is that a man and a horse, under the most favorable circumstances referred to in the table, could only do in a day as much work as is locked up in two-tenths and twelve-tenths of a pound of coal respectively.

Kind of Work.	Foot-pounds of work per day.	Number of pounds of coal the heat of combustion of which is equivalent to work.
Agent, Man.		
Raising his own weight up stair or ladder	2,088,000	0.21
Carrying weights up-stairs and returning unloaded	399,600	0.04
Pushing or pulling horizontally	1,526,400	0.15
Working pump	1,188,000	0.12
Agent, Horse.		
Drawing cart or boat (walking)	12,441,600	1.24
Drawing light railway truck (cantering and trotting)	6,444,000	0.64

It must be remembered, however, that only a small proportion of the total heat supplied by the combustion of the coal is employed in the production of useful work. The loss of the remainder is due to several causes, which, although theoretically preventable, will probably never be completely done away with. Some of them, such as imperfect combustion, conduction, and radiation, may, by careful firing and improved construction of furnaces, be rendered very small, but as things are the net result is that only from 50 to 70 per cent. of heat is transmitted to the water and steam, and that of this a small fraction, amounting in the best engines to only about 11 per cent., is converted into work. The enormous loss of power which thus occurs in the steam-engine has from time to time prompted efforts to devise other forms of machines, which, while equally serviceable for practical purposes, shall more efficiently utilize the heat of the fuel employed. The electric-engine, the air-engine, and the gas-engine are among the results of the efforts thus inspired. Coal is the source of power in them all, though the machinery for transforming its energy into useful work is widely different. In the steam- and air engines it is employed directly; from it the gas required for the gas-engine is extracted, and by it the zinc or other metals used in the galvanic cell are smelted. The subjoined table gives, in the second column, the percentage of heat which the various machines named transform into work under favorable conditions, and in the third, the relative cost of the fuel capable of producing equal quantities of work in each.

	Percentage of heat utilized.	Relative cost of fuel for equal quantities of work.
Electric-engine	50	55.00
Air-engine	13	0.84
Steam-engine	11	1.00
Gas-engine	10	6.00

The electric-engine and the gas-engine are convenient, both because they can be set in motion without delay and because the expenses connected with them are incurred only when they are actually working. They are compact in form, and are well suited for operations in which

a small amount of power at irregular intervals only is needed. The cost of the fuel is, however, in both cases too great to admit of their employment on a large scale. The air-engine, on the other hand, though making a better use than the steam-engine of the fuel with which it is supplied, is discarded on account of its bulk, and because the hot air oxidizes, and so destroys the metallic surfaces with which it is in contact.

In respect of their steam-producing qualities, the different varieties of coal possess merits and defects the importance of which can be estimated only by reference to the special purpose in view. Recent experiments carefully made by a board of chief engineers of the navy with anthracite and certain typical varieties of bituminous and semi-bituminous coals, afford the following data for a comparison of the vaporization efficiencies of the kinds of coal named:

than any other coal, and more men are required to produce a given weight of steam in a given time with it than are required with any of the coals likely to be placed in competition with it. But its supreme defect is its excessive slowness of combustion, in which respect it is inferior to any other coal, requiring a correspondingly larger boiler to produce a given weight of steam in a given time. For a naval steamer, where space is the most difficult thing to obtain, this defect is most serious, requiring a longer vessel to hold the greater quantity of boiler for a given speed; or, if this additional length be not given, then obtaining the speed at the expense of other valuable qualities of the vessel.

The semi-bituminous coals of Maryland and Southern Pennsylvania, which are the analogues of the steam-coals of Southern Wales, have merits and defects less strongly marked than the

Kind of Coal.	Rate of Combustion.	Rate of combustion per hour per square foot of grate-surface.		Pounds of water vaporized from the temperature of 212 degrees Fahrenheit, and under the standard atmospheric pressure.			Pounds of steam produced per hour.	Weight of the coals.		
		Pounds of the crude coal.	Pounds of the gasifiable portion of the coal.	Per pound of crude coal.	Per pound of the gasifiable portion of the coal.	Per cubic foot of the crude coal.		Per centum of the coal in refuse of ash, clinker, and soot.	Weight of the coal in pounds per cubic foot.	Cubic feet of space required to stow one ton of coal.
Bituminous	Slow	7.9896	7.4809	10.9595	11.7047	534.2756	2626 86	6.3670	48.75	45.9487
	Medium	13.0334	12.2036	10.2023	10.8960	497.3621	3989.14	6.3670	48.75	45.9487
	Maximum	14.3664	13.4517	10.1386	10.8280	494.2567	4369.67	6.3670	48.75	45.9487
Semi-bituminous	Slow	7.8199	6.858	10.3361	11.7858	558.1494	2424.93	12.3005	54.00	41.4815
	Medium	11.6340	10.203	9.9357	11.3292	536.5278	3467.69	12 3005	54.00	41.4815
	Maximum	13 9875	12.267	9.6912	11.0505	523 3248	4066.80	12.3005	54.00	41.4815
Anthracite	Slow	7.7905	6.611	9.9923	11.7751	559.5688	2335.36	15.1402	56.00	40.0000
	Medium	10.5798	8.978	9.9923	11.7751	559.5688	3171.50	15.1402	56.00	40.0000
	Maximum	12.9531	10.992	9.9923	11.7751	559.5688	3882.96	15.1402	56.00	40.0000

The merits of the anthracite as a steam-producer on board of vessels are very considerable. It gives a high economic vaporization, which is less affected by forcing the rate of combustion than in the case of other coals. It has a greater density than other coals, whereby a greater weight can be stowed in the same space; this is a very important merit for all vessels, and in an especial degree for naval vessels, where the space allowed for coal is necessarily more restricted, and where the need of carrying a long supply is greater than in merchant vessels. It possesses such strong cohesion that it is always furnished in lumps, and it suffers scarcely any waste by transportation or handling; but the same quality entails more labor in breaking it on the fire-room floor to suitable lumps for firing.

Anthracite is scarcely affected by weather or water, it emits no smoke, deposits but little soot, and is in no danger of spontaneous combustion, —all very important merits for steamers, and particularly for naval steamers. The absence of smoke is of the highest value to naval steamers in time of war, the presence of smoke betraying their position at long distances.

A great defect of anthracite is its large per centum of refuse, a considerable part of which is strongly adherent clinker, entailing great labor on the firemen. In this respect it is worse

anthracite. Their economic vaporization is sensibly the same as that of anthracite, but their density is less, causing a greater space to be required for the stowage of a ton. They are more injured by weather and water, and occasionally suffer spontaneous combustion, but very favorable conditions are necessary to produce it. Being very friable, they make a great deal of dust, and the loss in handling from this cause is greater than with anthracite. They emit a moderate quantity of light-brown smoke, and deposit a moderate amount of soot on the heating surfaces of the boiler. They give a less per centum of refuse than anthracite, and of that refuse a less proportion is clinker. In firing a given weight of coal the labor is much less with the semi-bituminous than with the anthracite. As steam-producers the semi-bituminous coals have a marked superiority over the anthracite in their much greater rate of combustion, a merit of the highest value for all steamers, and in an especial degree for naval steamers, allowing, with a given quantity of boiler, a greater speed of vessel than is possible with anthracite. In the case, however, of a forced combustion by steam-jets or blowers, the economic vaporization of the semi-bituminous coal would be less than that of the anthracite.

The bituminous coal gives off somewhat more

smoke than the semi-bituminous coal, and deposits correspondingly more soot on the heating-surfaces of the boiler. It has less density and requires more space to stow a given weight, but is about as friable, has about the same proportion of dust, and wastes about as much in handling and in transportation. Its economic vaporization is higher than that of either the semi-bituminous coal or of anthracite at all rates of combustion, due to its less per centum of refuse, for the economic vaporization of its gasifiable portion is less than that of the gasifiable portion of those coals. Its rate of combustion is higher than that of the semi-bituminous coal, and considerably higher than that of anthracite. Its per centum of refuse is greatly less, and a given weight of it can be fired with much less labor than in the case of either anthracite or semi-bituminous coal. As regards smoke, soot, dust, and spontaneous combustion, it is no more objectionable than the best of other coals, exclusive of anthracite, while it exceeds all in economic vaporization, rate of combustion, and ease of firing. Its great defect for use on shipboard is its low density, nearly one-seventh more space being required to stow equal weights than with anthracite, and nearly one-ninth more than with semi-bituminous coal. But if the comparison be made for the bulks required to produce equal quantities of steam, then the bituminous coal requires about one-eighth more space than anthracite and about one-tenth more space than semi-bituminous coal.

COAL-HEAVER. One employed in handling coal in loading and unloading, or in bringing it to a furnace in such quantities and at such times as may be required. In steamships the coal-heaver must break the coal to a proper size, remove all ashes and refuse, sweep boiler-flues or tubes, and assist in handling the fires and cleaning the machinery. Intelligent men acquire the art of "fireman" or "stoker" in a short time. On board vessels of war, at "general quarters," such coal-heavers as are not actually employed in serving the furnaces are attached to the powder division; and when the ship is under sail, without steam, they are placed in the deck-watches.

COAL-TAR. Tar extracted from bituminous coal.

Coal-fish. The *Gadus carbonarius.* Called *gerrack* in its first year, *cuth* or *queth* in its second, *sayth* in its third, *lythe* in its fourth, and *colmie* in its fifth, when it is full grown.

Coal-sacks. An early name of dark patches of sky in the Milky Way, nearly void of stars visible to the naked eye. The largest patch is near the Southern Cross, and called the Black Magellanic Cloud.

Coal-say. The coal-fish.

Coamings. The pieces that lie fore and aft in the framing of the hatchways and scuttles. The pieces that lie athwart ship, to form the ends, are called *head-ledges.*

Coast. The sea-shore; the sea-front of the land.

COASTER. A small vessel engaged in coasting.

COASTING. Sailing along the coast, for which is necessary a minute knowledge of the tides, currents, prevailing winds, rocks, shoals, harbors, landmarks, etc. The position of the ship is determined by the lead and by bearings.

COASTING TRADE. The commerce between two ports of the same realm or state. See COMMERCE.

COAST-PILOT. A pilot licensed to conduct vessels from one part of the coast to another. On going into port he is superseded by the local pilot.

COAST-WARNING. A storm-signal on the coast.

COASTWISE. By way of or along the coast.

Coast and Geodetic Survey. The scope of the United States Coast and Geodetic Survey embraces, 1, a *geodetic* survey of the whole area of the United States; 2, a *topographical* survey of the lands bordering the sea-coast and the rivers to the head of ship navigation, "to be carried as far inland as may be necessary for purposes either of commerce or defense" (Plan of the Survey); and, 3, the *hydrography* of the waters adjacent to the coast, Lake Champlain, the bays, harbors, and navigable rivers to the head of ship navigation, and including the Gulf Stream, its approaches, and extension.

GEODESY.—The geodetic work comprises a system of triangles, starting from a measured base and spreading over large areas, controlled in direction with reference to the meridian by astronomical *azimuths.* Three orders of triangulation are recognized on the work, viz., the *primary*, with sides varying in length from 20 to 169 miles; the *secondary*, with sides of from 5 to 40 miles; and the *tertiary*, with sides of less than 6 miles.*

The primary and part of the secondary series, composed principally of quadrilaterals, and verified at intervals by the measurement of additional bases, and by new determinations of the astronomical azimuth, latitude, and longitude, constitute the standard geodesy of the survey. From this class of work, in connection with pendulum observations for the determination of gravity, the dimensions and figure of the earth are deduced. Measurements of arcs of the meridian and of the 39th parallel of latitude are now (1880) in progress. Part of the secondary triangulation is used to connect the primary with the tertiary. The primary bases are measured with compensated bars or rods, designed by the late Prof. A. D. Bache, by whom the imperfections in the base apparatus previously in use were almost entirely eliminated. An apparatus is about to be constructed, upon the design of Assistant C. A. Schott, on the principle of the *Borda thermometer.* It will consist of two rods protected by wooden cases, very light and portable. Each rod will be provided with two compensations, by one of which the length is kept constant through all changes of temperature, whether sudden or gradual, and by the other the rear end is kept in place when the rod is set in its trestles. Like those now in use, the new rod will be provided with the level-sector for measuring inclinations. The forward end of each rod will be provided with an agate face, and the rear end with the *sliding-contact attachment*, terminating in an agate knife-edge, set horizontally.

The *angular measurements* are made with theodolites of the most perfect character known to the present state of science. In the *astronom-*

* Field Work of the Triangulation, by Gen. R. D. Cutts, Assistant.

ical work the transit instrument for time observations and the *zenith-telescope* for latitudes are used. The magnetic telegraph is used for measuring differences of longitude, measurements being made from station to station around a circuit, observers exchanging positions between stations, and finally returning to the initial point as a test of the accuracy of the work. Early advantage was taken of the transatlantic cables by the Superintendent of the coast survey to connect the principal observatories of Europe with those of the United States, assistants being sent abroad for that purpose.

Geodetic-leveling.—In order that all distances may be reduced to the level of the sea, the heights of primary points are measured by leveling instruments of the most refined character, and by methods which secure the utmost precision. Owing to local needs, the geodetic work has been begun independently in several parts of the country; the junction of these partial systems offers a crucial test of the accuracy of the work. Only selected observers of long training and great skill are employed on this portion of the survey. Trigonometric surveys are being carried on in several of the States by the Coast and Geodetic Survey in connection with the geodetic work; under instructions from the Superintendent the work is executed by college professors during their vacations, subject to the supervision of the chief of the geodetic division.

TOPOGRAPHY.—By the *tertiary triangulation*, based upon the secondary, are located points for the use of the topographers and hydrographers; being an essential part of the topography, it covers practically the same ground as the latter, as above described. Every triangulation point is permanently marked, and a sketch and description of the locality taken, with the bearings and distances of *witness-marks*, placed for the purpose if necessary, so that the point may be recovered when needed. The latitude and longitude of each triangulation point are computed, and its distance and azimuth from at least two other points.

Projections.—In all the original or manuscript maps and charts of the Coast and Geodetic Survey, as well as in the published series, the *polyconic projection* is used for representing the surface of the earth upon a plane, this projection exhibiting areas with the minimum of distortion, and showing distances in all parts of the sheet to the same scale. The projection is drawn upon the sheet before it is taken into the field. The parallels and meridians are drawn usually for each minute of latitude and longitude respectively. All triangulation points determined, falling within its limits, are plotted upon the sheet. The *plane-table* is the instrument used in the topographical survey. By this instrument all topographical features are represented upon the sheet in their true position (*i.e.*, in bearing and distance), relative to the already established points, and are drawn to scale. Cultivated fields, woodlands, grass, salt- and fresh-water marshes, hill and plain, sand-beaches, reefs, and other topographical features, whether natural or artificial, are represented, each with its appropriate conventional symbol. In order to avail himself of the triangulation points the topographer erects signals over them, unless, as often happens, they are located upon some conspicuous object, which itself answers for a signal. The scales of original topographical sheets vary from 1-20,000 of nature, the smallest scale, to 1-1200, the largest; those most frequently used are 1-20,000 and 1-10,000, or, approximately, $3\frac{6}{10}$ inches to the geographical mile, and $7\frac{2}{10}$ inches. The topographer locates the shore-line to low-water mark, and fixes the position of all islands, reefs, and rocks which are visible at low water. Elevations are represented by drawing the contours of different heights, usually for every 10 or every 20 feet above the *datum-plane*.

HYDROGRAPHY.—There are three classes of hydrography, differing mainly as to their results in the number of soundings in a given area: they are, 1, *harbor and river* work; 2, *inshore-soundings* along the coast; and, 3, *deep-sea soundings*. The first two are intended, *first*, for the development of fair-ways and anchorages, of shoals, bars, reefs, and other obstructions to navigation; and, *second*, to show the changes which from time to time take place. The harbor and river work is close enough for ordinary constructive works, though special surveys are usually made for that purpose. The area to be surveyed having been determined by the Superintendent, a *projection* covering the same is furnished to the hydrographer; all triangulation points which fall within its limits are plotted on the sheet, together with the shore-line, and any topographical objects or features, natural or artificial, which may assist him in his work. Copies of the *sketches and descriptions* of triangulation points above referred to are furnished him to enable him to find them the more readily. Having selected and recovered such points as he needs, he erects "hydrographic signals" over them (fixing new points for himself if needed), establishes his *tide-gauge*, and is then ready to begin his soundings. It is usual to run the soundings in parallel lines, with a second system of lines crossing the first at right angles; the number of lines and of soundings upon each line depend upon local conditions and needs. The time, depth, and character of the bottom are noted at each sounding. The position of the vessel or boat is fixed from time to time, either by simultaneous *cuts* from two theodolite stations on shore, or by measuring from the boat with a sextant, the angle between a selected central signal and one on either side of it respectively, or, as it is usually known, by the "three-point problem." In the deep-sea work the positions are determined astronomically. Other systems of lines in addition to the above are used for special purposes, such as the development of bars, shoals, intricate channels, etc. The soundings before being plotted are (in the harbor and inshore work) reduced to the plane of *mean low* water, or, on the Pacific coast, to that of *lower-low* waters. The curves of equal depths are drawn to correspond with the contours of equal elevation on shore. The work of the hydrographer extends to *high-water* mark, thus lapping that of the topographer. *Tidal observations* are carried on to give data for the reduction of soundings, for the computation of the *tidal establishment*, and for computing *tide-tables* in advance; in the last are predicted the times and heights (above or below the usual plane of reference) of the high and low waters at the stated parts for every day in the year. In many

localities continuous tidal observations, covering a complete lunar cycle,—nineteen years,—have been made, or are in progress.

Deep-sea Hydrography.—Under this head are being investigated the depths, currents, surface and sub-surface, the temperatures and densities of the sea-water from surface to bottom. Specimens of the water and of the bottom are being obtained for examination and analysis, and deep-sea dredgings of the most successful character are being carried on. For all soundings of over 100 fathoms wire is used, with the very perfect apparatus designed by Lieutenant-Commander C. D. Sigsbee, U.S.N., Assistant Coast and Geodetic Survey. Much of the deep-sea work is designed for the study of the origin, extent, phenomena, and influences of the *Gulf Stream.*

Physical Hydrography.—Under this head are investigated, either by special observations or by those taken in connection with other work, the *tidal circulation* and movements, the flow of rivers, the action of the waves, and the effect of each and of all combined in producing changes in harbors and upon the coasts; the effects, in conjunction with these, of artificial works, whether protective, such as breakwaters and jetties; for improvements, such as the deepening of channels and fair-ways; or economical, such as wharves, etc.; or for the reclaiming of overflowed lands, and, by analogy, the probable effects of any such works when in contemplation.

Coast-pilot.—The work of this division consists in preparing descriptions and views of the coasts, particularly the approaches to ports, harbors of refuge, etc., the description of the dangers to navigation, of the established artificial aids to navigation, and of sailing directions for navigating the coast, and for entering and leaving the ports and harbors.

Magnetic Work.—Observations are in continuous progress, at fixed magnetic observatories, and by parties moving from place to place on land and at sea, for declination and the other magnetic elements. The results are used for the preparation and correction of the *isogonic charts*, for keeping the variation of compass correctly noted upon the marine charts, and for recording the secular changes in the variation. It is hoped that sufficient data will ultimately be obtained to determine the law of the secular change, and to make it possible to predict it for many years in advance.

Instructions.—The work of each party in the field is executed under written instructions issued by the Superintendent.

Office Work.—All *original sheets and field-notes* are carefully preserved, and sent to the office at Washington, where, under the immediate direction of the assistant-in-charge of office, the computations and reductions are examined and checked, or made independently by a corps of trained computers. Plotting done in the field is carefully inspected, and, if need be, replotted from the original notes. *Drawings* for charts are made by one set of draughtsmen reducing the work from the original sheets to the publication scale, after which the reductions are verified by other draughtsmen. The charts thus prepared are engraved upon copper plates, from which, after careful examination, electrotype plates are made for the plate-printer, no printing being done from the engraved plate. The work passes through many hands and processes, by which a constant check is kept upon its accuracy, and at each stage it is examined, and must be approved by the Superintendent.

Publications.—The regular publications of the Coast and Geodetic Survey consist of Marine Charts, Magnetic Charts, the Coast-pilot, the Superintendent's Annual Report of Progress, the Tide-tables of the Atlantic and Pacific Coasts, and the series entitled "Methods, Discussions, and Results," in which last, as the name implies, are described the plan of the survey, the methods, instruments, and appliances used, and the results expected and required. The most of these are scientific papers of great value. The *occasional publications*, usually contained in the appendix to the Annual Report, are scientific papers, which do not fall under the last-named head. The *Charts* are in four series, viz.: 1, *sailing charts*, on a scale of 1-1,200,000; 2, *general coast charts*, on a scale of 1-400,000; 3, *coast charts*, on a scale of 1-80,000; and, 4, *harbor charts*, on larger scales.

Organization.—The *personnel* of the Coast and Geodetic Survey comprises a superintendent, in general charge of the work, with a corps of assistants, sub-assistants, aids, and recorders for field service; of computers, tidal computers, draughtsmen, engravers, electricians, mechanicians, and plate-printers for office work; a disbursing agent and accountant; a secretary, and copyists. By authority of law, officers and men of the navy are employed upon the hydrographic work of the survey. There have been thus far four superintendents, viz., Ferdinand R. Hassler, from the first organization of the work to 1843; A. Dallas Bache, LL.D., from 1843 to 1867; Benjamin Peirce, LL.D., from 1867 to 1874; and Carlisle P. Patterson, C.E., LL.D., since 1874.

Weights and Measures.—The superintendent of the Coast and Geodetic Survey is also superintendent of the standard weights and measures of the United States.—*Edward P. Lull, Commander U.S.N.*

Coast-Guard of Great Britain, The, originally instituted as a means of revenue protection, has taken, on account of the free-trade policy of Great Britain, which exempts almost all articles from duty except spirits and tobacco, the character of a naval reserve and a life-saving and signal service. It employs 4000 officers and men ashore; afloat, there are 9 large ships (iron-clads) and 40 small vessels, the latter used as cruising and watch vessels, and varying from 100 to 500 tons each. The first named form the squadron of the first reserve; one is attached to each coast-guard district, and is commanded by the captain commanding the district; they are all under reduced complements.

The whole coast is divided into 9 districts, termed the Hull, Harwich, Newhaven, Weymouth, Liverpool, Leith, Clyde, Limerick, and Kingstown districts. The districts are subdivided into 79 divisions, in charge of inspecting officers, of whom, at present writing (May, 1880), 36 are commanders, 32 lieutenants, and the remainder subordinate coast-guard officers. The divisions are again divided into 225 stations, each in charge of a chief officer, who is about equal in rank to a warrant-officer. The whole is under

the command of an admiral superintendent, whose principal office is in London.

At each station are erected neat groups of cottages for the men, in which they may live with their families. The coast lying between the stations is patrolled at all times, and means of signaling from point to point are at hand. During the summer months all the force that can be spared is embarked in the 9 coast-guard ships, which then cruise in squadron for 6 weeks, generally as part of the Channel squadron. The men are thus kept in a high state of efficiency as regards drill and seamanship.

The qualifications for entry into the coast-guard are as follows: Every seaman in the navy of good character, who has completed 8 years' continuous service, whose age does not exceed 37, who is either a trained man or a seaman gunner, and who wears at least one good conduct badge, is, upon the recommendation of his captain, eligible. There is no restriction as to the number of candidates to be recommended from any particular ship.

All men are discharged from the coast-guard at 50, whether fit for service or not, excepting chief boatmen in charge, who are discharged at 55. On leaving they are under the same rules as regards pensions as the other men of the navy.

Men who enter the coast-guard must renew their continuous-service engagements while serving in that force; they may also be discharged into a sea-going ship for misconduct, or at their own request.

This unequaled body of men forms England's most efficient and valuable reserve in time of war, there being enough men employed to furnish the men of the seamen class for a squadron of 15 large ships.

The estimates of 1880 for the men of the coast-guard are £50,781. The total charge of the coast-guard service, including officers and men of the ships and vessels employed, provisions, stores, buildings, etc., including the above £50,781, is £454,414.—*F. E. Chadwick, Lieutenant-Commander U.S.N.*

Coat. A piece of canvas fitted around the partners of the masts to prevent the water from getting below. A layer of paint, varnish, shellac, etc.

COAT-TACKS. The peculiar nails with which mast-coats are fastened.

Coat of Mail. The chiton shell.

Cob. To punish by striking on the breech with a strap or cobbing-board. A young herring. A sea-gull. A breakwater or dock made of piles and timber and filled in with rocks.

Cobb. A Gibraltar term for a Spanish dollar.

Cobbo. The small fish known as the miller's thumb.

Coble, or Cobble. A low flat-floored boat used in the cod- and turbot-fisheries; the rudder extends 4 or 5 feet under the bottom. There is also a small boat of the same name used by salmon-fishers.

Coboose. See CABOOSE.

Cock. A device for regulating or stopping the flow of fluids through small pipes. It consists principally of a conical "plug," accurately fitted to a "shell" or "chamber," with its axis at right angles to that of the pipe to which it is attached, the plug being penetrated by a hole equal in area to that of the pipe. When the plug is turned on its axis the opening may be increased or diminished at will, or closed altogether. The shell is provided with flanges or screw-nipples for attaching it to the pipe, and the plug with a handle. When a cock is used for drawing liquids from a reservoir it is frequently called a "faucet" or "spigot." The hammer of a gun-lock. *To cock* a piece is to raise the hammer to its full extent.

Cockade. A knot of ribbons or rosette worn on the hat as a badge.

Cock-a-hoop. Full of confidence and high spirits.

Cockandy. A name for the puffin, otherwise called *Tom Noddy* (*Fratercula arctica*).

Cock-bill. *To cock-bill* the anchor is to suspend it from the cat-head preparatory to letting go. *To cock-bill* the yards is to top them up at an angle with the deck,—the symbol of mourning.

Cock-boat. A very small boat used on rivers or near the shore.

Cockburn, Sir George, Admiral. Serving the crown of Great Britain from his youth, this officer as he advanced in rank manifested a capacity for responsible command. During the long war with revolutionary France and the Empire he captured the island of Martinique. At a later period, when peace had been made with France and a war begun with the United States, Cockburn was sent to America, and numbered among his exploits the destruction of some of the buildings in Washington and on the shores of the Chesapeake and Potomac. Finally he was intrusted with the duty of conveying Napoleon I. and his suite to their prison on the island of St. Helena.

Cocked Hat. The full-dress head-covering of naval officers. See UNIFORM.

Cocket (*Eng.*). A cock-boat. A custom-house seal. An instrument sealed and delivered by officers of the customs as a warrant that merchandise is entered. An office in the custom-house where goods to be exported are entered.

Cocket-bread. Hard sea-biscuit.

Cockle. A common bivalve mollusk (*Cardium edule*), often used as food.

Cockling Sea. Tumbling waves dashing against each other with a short and quick motion.

Cock-paddle. A name of the paddle, or lump-fish (*Cyclopterus lumpus*).

Cockpit. An apartment below the water-line, in which the wounded are placed during an engagement. The rooms are used as store-rooms and for quarters for such officers as cannot be accommodated in the steerage. In olden times the warrant-officers were quartered in the fore cockpit, and subsequently under the forecastle; hence the name *forward-officers*.

COCKPITARIAN. A name for one who was quartered in the cockpit.

Cocksetus. An old law-term for a boatman or coxswain.

Cocksure. Dead certain.

Cockswain. See COXSWAIN.

Cocoanut-tree. The *Palma cocos* yields *toddy*; the nut a valuable oil and milky juice; the stem, bark, branches, etc., also serve numerous purposes.

Cod. The centre of a deep bay. The bight of a trawl or seine. Also, the *Gadus morrhua*, one of the most important of oceanic fishes. The

ccd is always found on the submerged hills known as banks; as, the Dogger Bank and banks of Newfoundland. *To cod*, to rig; to harass; to tantalize.

COD-BAIT. The large sea-worm, or lug, dug from the wet sands; the squid or cuttle, herrings, caplin, any meat, or even a false fish of bright tin or pewter.

COD-FISH. See COD.

COD-FISHER. A banker, or fishing-vessel, which anchors in 60 or 70 fathoms, and remains fishing until full, or driven off by stress of weather. Season from June until October. See FISHERIES.

COD-LINE. An eighteen-thread line.

COD-SOUNDS. The swim-bladders of cod-fish, cured and packed for the market.

Coddy-moddy. A gull in its first year's plumage.

Code. See SIGNALS.

Codrington, Sir Edward, Admiral. In 1827, when the Greeks were resisting Turkish oppression, a combined French, Russian, and English fleet was dispatched to the Mediterranean to stop the cruelties practiced by Ibrahim Pacha, who was then in command of an Egyptian fleet. Sir Edward Codrington commanded the British squadron. Entering the harbor of Navarino, he commenced negotiations with the pacha, with the view of putting an end to the barbarities of the Turks. A reference to Constantinople being deemed necessary before any compact could be concluded, it was arranged that the pacha's fleet should remain in the harbor until the sultan's reply was received, and in the meanwhile the European fleets retired; but they had scarcely left Navarino when the Turks violated the armistice and attempted to sail out of the harbor. Codrington forced them back. A fierce battle ensued, and the Turkish fleet of 81 men-of-war was destroyed, only 1 frigate and 15 smaller vessels being left in a condition to put to sea again.

Coehorn. A small mortar, usually of bronze, throwing a shell of from 12 to 24 pounds, and convenient for ships' gangways, launches, etc., afloat; and for advanced trenches, the attack of stockades, etc., ashore. It takes its name from its inventor, Baron van Coehorn, a celebrated Dutch engineer and general of the latter part of the 17th and early part of the 18th centuries.

Coffer-dam. A device employed in hydraulic engineering to lay bare a portion of the submerged surface. It consists of a water-tight inclosure, formed by double lines of piles filled in with clay tightly rammed. It may also be made with piles only, the piles being driven close together, and sometimes notched or dovetailed into one another; or, if the water is not very deep, the piles may be driven at a distance of five or six feet from each other and grooved in the sides, with boards let down between them in the grooves. However formed, it must be made very strong and well braced from the inside to resist the pressure of the water from without. The water inclosed within the dam is gotten rid of by being pumped out.

Cog. The tooth of a wheel, by which motion is communicated to another wheel. A coak or dowel.

Cogge. An Anglo-Saxon word for a cockboat or light yawl.

COGGE-WARE. Goods carried in a cogge.

Coggle, or Cog. A small fishing-boat.

Cogmen. Shipwrecked mariners who wander about begging and stealing; nautical tramps.

Coguing the Nose. Making comfortable over hot grog.

Coign. See QUOIN.

Coil. A quantity of rope wound into a ring or series of rings; each turn of the rope is a *fake*, and several of these fakes, one within the other, are called a *sheave* or *tier*. In a *Flemish coil* there is but one sheave, the hauling part being in the centre.

Coir. The fibrous husks of the cocoa-nut, used for making ropes, mats, brushes, brooms, etc. Coir cables have the advantage of floating on the water, but they are disagreeable to handle.

Coke. The charcoal obtained by heating coal with the imperfect access of air, or by its distillation. The former is usually called *oven coke;* the latter *gas coke*, being abundantly produced in gas-works. Caking coal (for which see COAL) is most suitable for the manufacture of coke. As the coal becomes heated it evolves a number of substances, solids, liquids, and gases, and yields a residue, the coke, relatively richer in carbon than the original coal. Coke is hard, brittle, and porous, varying in color from iron-gray to blackish-gray, and more or less of a metallic lustre. It absorbs moisture from the air sometimes to the extent of 30 per cent., and contains an amount of ash ranging from ½ up to 15 per cent. It gives off no smoke in burning, is of great value as a fuel, evolving a very large amount of heat, and is used extensively in smelting ores and for other purposes.

Coker. The old name for a cocoa-nut-tree.

Cold-blast. Air forced into a smelting-furnace at a natural temperature, in contradistinction to a heated blast, which is more economical, but produces iron of an inferior quality.

Cold-chisel. A stout chisel made of steel, used for cutting iron when it is cold.

Cold-eel. The *Gymnotus electricus.*

Cold-hammering. The hammering of metal at a low temperature to give hardness and temper.

Cole. Colewort, or sea-kale.

Cole-goose. A name for the cormorant (*Phalacrocorax carbo*).

Cole-perch. A small fish less than the common perch.

Colhoun, Edmund R., Commodore U.S.N., was born at Chambersburg, Pa., May 6, 1821; appointed midshipman from Missouri, April 1, 1839; attached to sloop "Marion," Brazil Squadron, 1839–41; frigate "Congress," Mediterranean and Brazil Squadrons, 1842–44; Naval School, Philadelphia, 1845; promoted to passed midshipman, July 2, 1845; frigate "Cumberland," Home Squadron, 1846–47. Served in the Mexican war, being present at the first attack on Alvarado, under Commodore D. Conner, and also under Commodore M. C. Perry, at the capture of Tabasco. Receiving-ship at Philadelphia, 1850–51; frigate "St. Lawrence," Pacific Squadron, 1851–53; resigned June 27, 1853. Re-entered the navy as an acting lieutenant, 1861; commanded steamers "Shawsheen" and "Hunchback," North Atlantic Blockading Squadron, 1861–62; was in the following engagements: Roanoke Island, February 7 and 8, 1862; capture of Newbern, March 14, 1862; engagement on the

Blackwater River, below Franklin, Va., October, 1862; commissioned as commander, November 17, 1862; commander steamer "Ladona," North Atlantic Blockading Squadron, 1863; monitor "Weehawken," South Atlantic Blockading Squadron, 1863; took part in the different actions with Forts Sumter, Wagner, Beauregard, etc., from July 10 to September 15, 1863; commanded monitor "Saugus," 1864–65; engaged Howlett's Battery on James River, June 21 and Dec. 5, 1864; took part in the bombardment of Fort Fisher, Dec. 25, 1864, and its capture, Jan. 15, 1865; was on special duty at New York, 1866; fleet-captain, South Pacific Squadron, 1866–67; commissioned as captain, March 2, 1869; commanded monitor "Dictator," 1869–70; flag-ship "Hartford," Asiatic Station, 1873–74; was in command of the Asiatic Station for four months; was then transferred to the "Richmond," flag-ship of the South Pacific Station, being in command of her from August, 1874, to July, 1875; commissioned as commodore, April 26, 1876. Relieved rear-admiral John Rodgers, in command of the navy-yard, Mare Island, Cal., April 17, 1877, of which yard he is at present date commandant.

Collar. The part of a stay which goes over the mast-head. A strap or grommet in which is seized a heart or dead-eye; used for stays, bobstays, bowsprit-shrouds, etc.

In mechanism, a ring of metal placed upon a shaft to prevent motion in direction of the shaft's axis while leaving it free for rotative motion. A collar may be wrought or cast upon the shaft as a part thereof, or it may be a separate piece confined by pins or set-screws.

COLLAR-HEART. See HEART.

Collar-beam (*Obs.*). Formerly, it was the beam upon which the stanchions of the beakhead bulkhead stood. The upper side of it kept well with the upper deck port-sills, and was let down into the spirketing at the side, but its springing over the bowsprit in the middle gave it a form which in timber was not to be obtained without great difficulty; a framing of carlings, with a stanchion on each side, was generally substituted in its place.

Collier. A vessel employed exclusively in the coal-trade.

Collimation, Axis or Line of. The axial line of a telescope, or an imaginary line which passes through the optical centre of the object-glass and the intersection of cross-wires at its focus. The *error of collimation* is the deviation of the line of collimation from its normal position.

Collingwood, Lord Cuthbert, Admiral. A disciple of the famous Nelson, and worthy of all honor for his services and undaunted bearing throughout a long career in the British navy. He played a conspicuous part in the great victories achieved by Lord Howe and Lord St. Vincent (which see), and in command of a line-of-battle ship at the famous battle of Trafalgar he was the first to break the line of the French and Spanish fleets. When Nelson saw him leading his squadron into the enemy's array, he exclaimed, "See how that noble fellow Collingwood takes his ship into action." Firm, mild, brave but prudent, he was adored in the navy, and died, in 1810, deeply regretted.

Collins, Napoleon, Rear-Admiral U.S.N. Born in Pennsylvania. Appointed from Iowa, January 2, 1834.

Promoted to passed midshipman, July 16, 1840.

Commissioned as lieutenant, November 6, 1846; sloop "Decatur," Home Squadron, 1846–49; at Tuspan and Tabasco, Mexican war; steamer "Michigan," on the lakes, 1850–53; commanding store-ship "John P. Kennedy," North Pacific Expedition, 1853–54; steam-frigate "Susquehanna," East India Squadron, 1854–55; navy-yard, Mare Island, California, 1856–57; sloop "John Adams," Pacific Squadron, 1857–58; steamer "Michigan," on the lakes, 1858–60; commanding steamer "Anacosta," Potomac Flotilla, 1861; engagement at Acquia Creek, May 31 and June 1, 1861; commanding gunboat "Unadilla," South Atlantic Blockading Squadron, 1861–62; battle of Port Royal, November 7, 1862; various expeditions on the coasts of South Carolina, Georgia, and Florida, 1861–62.

Commissioned as commander, July 16, 1862; commanding steamer "Octorara," West India Squadron, 1862–63; commanding steam-sloop "Wachusett," special service, 1863–64; on the 7th of October, 1864, Commander Collins, then in the "Wachusett," seized the rebel steamer "Florida," lying within the harbor of Bahia, Brazil; the capture was effected without loss of life.

Commissioned as captain, July 25, 1866; commanding steam-sloop "Sacramento," special service, 1867; navy-yard, Norfolk, 1869–70. Commissioned as commodore 1871, and as rear-admiral 1874. Died in 1876.

Collision. See RULE OF THE ROAD AT SEA.

COLLISION-CLAUSE. See RUNNING-DOWN CLAUSE.

Collop. A cut from a joint of meat.

Colmie. A fifth-year or full-grown coal-fish; sometimes called *comb.*

Colmow. An old word for the sea-mew, derived from the Anglo-Saxon.

Colombo. The principal seaport town and the capital of Ceylon, on its west coast, in lat. 6° 56′ N., lon. 79° 49′ E. Pop. 100,000. The harbor, defended by several forts, is small, and the roadstead is safe only during the southeast monsoon.

Colonnati. The Spanish pillared dollar.

Colorable. Ship's papers so drawn as to be available for more than one purpose. In admiralty law, a probable plea.

Colors. A national flag. In port the colors are hoisted at 8 A.M., and kept flying till sunset. At sea the colors are generally shown on falling in with another vessel. The colors are half-masted as a symbol of mourning, and are hauled down as a token of submission. Dipping the colors is a compliment or salute, but our men-of-war are forbidden to dip their colors except in return for a similar compliment. The boats of a man-of-war are required to keep their colors flying while absent from their ship. In a funeral procession the colors are draped.

In the navies of some European countries, when the colors are hauled down they are received by a commissioned officer, and all persons on deck take off their caps as a mark of respect.

COLOR-CHEST. See SIGNAL-CHEST.

COLOR-LOCKER. See SIGNAL-LOCKER.

Colt. A short piece of rope with a knot on one end, formerly used to start skulkers.

Columba (Lat. "The Dove"). A constellation next to, and to the S.W. of, Canis Major. *a Columbæ* may be found by producing the line joining Procyon and Sirius to about the same distance.

Columbia. A name often given to America in honor of the great discoverer. The patriotic ballad, "Hail Columbia, happy land," was written by Joseph Hopkinson for the benefit of an actor named Fox, and to an air entitled "The President's March," composed in 1789 by a German named Teyles, on the occasion of Gen. Washington's first visit to a New York theatre.

Columbiad. A kind of heavy cannon invented by Col. Bomford. See ORDNANCE.

Columbus, Christopher, a native of Corsica, when the island was under the government of the republic of Genoa, cherished for eighteen years the theory of the rotundity of the earth, and sought to establish it by endeavoring to get the means for sailing in a westerly direction from the shores of Spain. He was doomed to many checks and disappointments, and endured the ridicule of the ignorant. At length, Isabella, the queen of Ferdinand of Spain, caused him to be supplied with ships and provisions that he might make a voyage of discovery in the direction he had indicated. His attempt was attended with danger, for the crew of his ship, impatient of its slow progress, murmured and exhibited a mutinous disposition, but his science, courage, and determination had a happy issue, for in 1492 he discovered San Salvador, in the western hemisphere. A second expedition in 1493–96 conducted him to that of the outlying islands, and he reached the continent of America on a third voyage, in 1498. The discoveries and fulfillment of the theory of Columbus did not reap the recompense to which so much energy and perseverance entitled him. He was pursued by envy and jealousy, and fell a victim to his triumph over ignorance and superstition, dying in poverty at Valladolid, in Spain, 20th May, 1506.

Column. See FLEET TACTICS.

Colures (Gr. *kolouros*, dock-tailed, or cutting the tail; from *kolouein*, to cut, and *oura*, the tail). A term originally applied to any great circle passing through the poles of the heavens. It is derived by some from the fact that one part of each of these circles appears always "cut off" by the horizon. A more probable explanation of the word seems to be "cutting the tail" of the northern constellation,—*i.e.*, passing through the pole star. This star is situated in the tail of the Lesser Bear, a group which appears to have been more anciently figured as a dog; hence the pole star is called the Cynosure (*kunosoura*), "The Dog's Tail" (*kuôn*, *kunos*, a dog, and *oura*, the tail). The word colures has more lately become restricted to the two circles of the system which pass through the four cardinal points of the ecliptic,—the equinoctial and solstitial points, —the former being called the *Equinoctial Colure*, and the latter the *Solstitial Colure*. The equinoctial colure may be regarded as the initial position of the hour-circle; the solstitial colure passes through the poles of the ecliptic as well as those of the equinoctial.

Coma Berenices. See CONSTELLATION.

Comb. The projection on the hammer of a gun-lock, to which the thumb is applied in cocking the piece. A name for the colmie. A wooden form used by riggers in weaving mats, gaskets, etc.

Comber. A long curling wave.

COMBER, BEACH-. See BEACH-COMBER.

COMBER, GRASS-. See GRASS-COMBER.

Combing. See COAMING.

Comb the Cat. To separate the tails of the "cat" by running the fingers through them.

Combustion. The practical means of producing artificial heat. It is the union of oxygen with the carbon and hydrocarbon contained in the various kinds of fuels, most of which are hydrocarbons, and which have been produced by the heat of the sun.

Come. *To come to* is to luff, or bring the ship's head nearer to the wind. *To come to*, or *to come to an anchor*, to let go the anchor. *To come up* a rope or tackle, to slack it off or let it go. *To come up with* a vessel is to overtake her. The anchor *comes home* when it slips through the mud in heaving up,—that is, the anchor is dragged toward the ship instead of the ship being hauled up toward the anchor.

Comity of Nations (Lat. *comitas gentium*). That species of international legal courtesy by which the laws and institutions of one country are recognized and given effect to by another. See INTERNATIONAL LAW.

Command. To order with authority. To direct. To exercise supreme authority over. To lead. The word is also used to express both the order given and the force commanded. It signifies also advantage of position; as, when we say that one place commands another, we mean that it overtops or overlooks the other.

Commandant. The officer in command of a navy-yard or naval station. Under the direction of the Secretary of the Navy he exercises control over every department in the yard, and is held responsible for the preservation of all buildings, stores, and vessels, and for the judicious application of all labor.

He is to see that none but effective men are employed, and that the rate of wages conforms with that of private establishments in the vicinity. He is to see that the officers perform their duties in a proper manner, and that all reports and returns are made at the time and in the manner directed by the department. He is to establish regulations to guard against fire, and cause the entire force of the yard to be organized into fire companies, and drilled once a month.

He will not permit any vessel to be repaired at the yard without an order from the Department, except in an emergency, and all vessels repairing are under his control.

Commandant of Cadets. The executive-officer of the U. S. Naval Academy.

Commander. This title in the British and United States navies has the same derivation as commodore, viz., from the Spanish "*Comendador.*" It was first introduced into the U. S. navy in 1838, when it was enacted that "master-commandants" should be known and styled "commanders," although the pay-bill, approved March 3, 1835, recognized the title. It is the next rank below that of captain, and corresponds with that of lieutenant-colonel in the army.

A commander commands vessels of the third and fourth classes; may be employed as chief of staff to a commodore; on duty under a bureau; or as aid to a flag-officer of either grade on shore-stations.

Commander. A heavy wooden maul, for beating down the eyes of the rigging, and for other purposes where the use of an iron instrument would injure the rigging.

Commander, Master and, or Master-Commandant. For some time after the formation of the regular Royal navy by Henry V., of England, those who attended to the navigation of the ship and the mariners were a totally distinct class from those who superintended the fighting department and the soldiers. The first attempt to unite in one person the two offices may be traced in the now abandoned term of master and commander. The first officer of the rank was Robert Best, appointed September 13, 1667, in the Mediterranean, by Sir John Narborough, to a vessel called the "Orange-Tree."

Commander, Lieutenant-. This intermediate rank between commander and lieutenant was first introduced into the United States service at the reorganization of the navy in 1862. Before that time lieutenants when in command of a small vessel-of-war were styled lieutenants commanding. A lieutenant-commander holds assimilated rank with a major in the army.

A lieutenant-commander may act as aid to an admiral, vice-admiral, rear-admiral, or commodore commanding afloat; as aid or executive of a commanding officer, navigating, or watch-officer in first-, second-, and third-rates; and performs duty at shore-stations or under a bureau, and may be ordered to command a vessel of the fourth class.

Commander-in-chief. The President of the United States is the commander-in-chief of the army and navy, but the title of commander-in-chief is given to an officer in command of an independent fleet or squadron, when appointed as such by the Navy Department. He possesses all the rights, honors, and responsibilities from the date on which his flag is hoisted until it is finally hauled down.

He will make himself well acquainted with the sailing and steaming qualities of the vessels under his command, and inform himself of the quantity of coal each vessel can carry, the amount used in average and in full steaming during twenty-four hours. He will inspect the vessels under his command at least once in six months, and satisfy himself that they are in a state of efficiency to perform any service that may be required.

He will cause the boats of his fleet or squadron, manned and armed, to be frequently assembled, inspected, and exercised in manœuvres in landing, embarking, and boarding vessels. He will see that the vessels of his fleet are frequently practiced in exercises in port and in performing manœuvres at sea; he will frequently exercise the officers in making night- and day-signals to insure accuracy, and he will cause quarterly reports of all general exercises to be made in accordance with the prescribed form, which, with his remarks, are to be forwarded to the Navy Department. He will not inflict punishment upon the people of any civilized nation with whom the United States has treaties, for any violation, alleged or otherwise, of such treaties or of international law; but in the absence of a diplomatic representative, he will enter into correspondence with the authorities of the nation, and will take the earliest opportunity to communicate all the information in his possession to the Navy Department. He is to satisfy himself that the laws and regulations of the navy are maintained on board every vessel under his command, and also that all the special orders of the Secretary of the Navy, through the different bureaus of the Navy Department, are strictly observed.

The commander-in-chief of a squadron, being frequently invested with a great charge, on which the fate of a nation may depend, ought certainly to be possessed of abilities equal to so important a station and so extensive a command. His squadron is unavoidably exposed to a variety of perplexing situations in a precarious element. A train of dangerous incidents necessarily arise from those situations. The health, order, and discipline of his people are not less the objects of his consideration than the condition and qualities of his ships. A sudden change of climate, a rank and infectious air, a scarcity or unwholesomeness of provisions may be as pernicious to the former as tempestuous weather or dangerous navigation to the latter. He ought to have sufficient experience to anticipate all the probable events that may happen to his squadron during an expedition or cruise, and to provide against them. His skill should be able to counteract the various disasters which his squadron may suffer from different causes. His vigilance and presence of mind are necessary to seize every favorable opportunity that his situation may offer to prosecute his principal design; to extricate himself from any difficulty or distress; to check unfortunate events in the beginning, and retard the progress of any great calamity. He should be endued with resolution and fortitude to animate his officers by force of example, and promote a sense of emulation in those who are under his command, as well to improve any advantage as to frustrate or defeat the efforts of his ill fortune.

He should be well acquainted with the principles of naval law, that he may judge with propriety of the proceedings of courts-martial, and correct the errors and restrain the abuses which may happen therein by mistake, ignorance, or inattention.

As he is frequently called upon to represent the government on occasions of great moment, he should be well versed in international law.

He does his utmost to protect the commerce of his country, and to this end causes surveys to be made of all dangers to navigation, and in time of war affords convoy and protection to merchantmen of the United States, and also to the merchantmen of nations which may be in alliance with the United States.

The most essential part of his duty is military conduct. He is required to keep pace with the various improvements in vessels and ordnance, and the changes in fleet tactics in consequence thereof. When preparing a fleet or squadron for sea, in time of war, as the vessels join him, he will furnish each commanding officer with a copy of all general orders, dispositions, private signals, orders of battle, etc., so that they may

have a complete understanding of what they will be called upon to do on going into action.

When the squadron shall put to sea it is frequently exercised in fleet tactics that the officers may become proficient in their duties. When he meditates an attack the commanding officers should be made acquainted with the plan of battle, and his orders should be drawn up with the greatest care; they should be simple, perspicuous, direct, and comprehensive, and should direct the plan to be followed in case either of success or defeat. History and experience confirm the necessity of these observations, and present us with a variety of disasters that have happened on such occasions merely by a deficiency in this material article.

When an admiral conquers in battle, he should endeavor to improve his victory by pushing the acquired advantages as far as prudence directs; when he shall be defeated, he ought to embrace every opportunity of saving as many of his ships as possible, and endeavor principally to assist those which have been disabled. In short, it is his duty to avail himself of every practicable expedient rather than sink under his misfortune, and suffer himself to become an easy prey to an enemy.

Commanding Officer. The officer in actual command of a government vessel. He is a line-officer, and in case of his absence or death, he is succeeded by the line-officer next in rank.

The duties of the commanding officer are very comprehensive, inasmuch as he is not only answerable for any bad conduct in the military government, navigation, and equipment of the ship he commands, but also for any neglect of duty or ill-management in his inferior officers, whose several duties he is appointed to superintend and regulate.

On first joining his vessel he will make a thorough personal examination of her, and will inform himself fully as to the condition of the vessel, her engines and boilers, as also regarding the qualifications of the officers placed under his command. He will be furnished by the commandant of the navy-yard, or by the previous commanding officer of the vessel, if the vessel is already in commission, with a statement of her condition and of her presumed or ascertained qualities, as also with drawings and plans showing the dimensions of the vessel, the arrangement and stowage of the holds, store-rooms, magazines, shell-rooms, shot-lockers, etc.

He will not sail from a port in the United States until the men are watched, quartered, and stationed; and before proceeding to sea, he is, if possible, to exercise the men at the different evolutions, and practice them at target-firing. He will cause a routine of drills to be prepared, and will see that the men are thoroughly conversant with their various duties. He will cause the senior engineer to submit to him, for approval, his watch, fire, quarter, and cleaning bills, showing the specific duties of each member of the force under his charge. He will pay the greatest attention to the health of the crew and the cleanliness of the vessel, frequently inspecting her throughout; he will see that the officers are considerate as regards the health of the men, and that they are not unnecessarily exposed to the sun or to the night-dews, and he will see that all regulations regarding the meal-hours are observed. He will make careful and repeated trials of the vessel, under sail and under steam, with every variety of wind and weather, and will inform himself thoroughly as to her capabilities for every service, and of the length of time that she would be able to keep the sea under steam. He will make a quarterly report of her sailing qualities to the Navy Department in accordance with the prescribed form. When in command of an iron vessel, he will have the bottom examined on every opportunity, being careful that the plates are cleaned and coated with preserving composition as often as necessary, that no injury be done by corrosion, and that no copper articles rest on the bottom in contact with the iron.

On putting to sea he will cause a bright lookout to be kept, and on approaching a foreign man-of-war, or being approached by one under suspicious circumstances, he will have the crew at quarters, ready for battle, and preserve this disposition until he ascertains her intentions. He will not suffer his vessel to be searched by any foreign power under any pretext, nor any officers or men to be taken out, so long as they have power of resistance; if force be used, resistance must be continued as long as possible; if overcome, he is to yield his vessel, but not his men without the vessel.

When a vessel of an enemy strikes her flag in an action, it will be the duty of the commanding officer to send an officer on board, if possible, to demand the captain's sword, and to bring that officer with him, as a proof that the vessel has surrendered; and if, under these circumstances, she should again hoist her flag and continue the fight, she may be destroyed. On taking possession of a captured vessel he will adopt all necessary precautions to prevent her from being recaptured. He will send all the officers and a number of the crew of the captured vessel on board of the vessel he commands, and will preserve all journals, signals, written orders, and important papers, particularly those that certify to the validity of the prize. He will see that prisoners of war are treated with humanity, that their personal property is carefully protected, and that they have the use of such of their effects as are necessary to their comfort, and that they are duly supplied with rations, but he will take care that prisoners of war are guarded and deprived of all means of escape or revolt. When an action is over, it is the duty of the commanding officer of a vessel to repair all damages and put the vessel under his command in good fighting order without delay; to have reported to him the exact amount of munitions of war remaining on board, and to transmit to the commander-in-chief an account of the battle, including a statement of the conduct of the officers and crew under his command, with a list of killed and wounded. Should he be compelled to strike the flag, he is to take special care to destroy all signals and papers, the possession of which by an enemy might be injurious to the United States, and he will keep them so prepared, with weights attached, that they will sink immediately on being thrown overboard.

He will make to the Department, through the commander-in-chief, a full report of any action, chase, or important movement in which the vessel he commands may be engaged, and will also furnish diagrams illustrating the positions and

movements of the vessels, the direction of the wind, the bearing, distance, and outline of land, should any be in sight, and all information which may tend to a clear understanding of the occurrence. He will keep a journal, noting in it all desirable information in regard to the naval forces or armament of foreign powers, with such information regarding commerce, hydrography, etc., as may be useful to the government, and he will communicate immediately to the Bureau of Navigation all hydrographic information which may affect the charts or sailing directions. At the expiration of the cruise the journal will be forwarded to the Bureau of Navigation. He will direct the officers under his command, when visiting foreign ports, to obtain and report to him in writing such information as he may designate, and will himself report to the Navy Department the capacity, power, and speed of the foreign vessels of war he meets with.

He will see that the sailing directions, charts, and light-lists are carefully compared with those of all public vessels that he may meet having later information; will have those of the vessel under his command corrected, and tracings or copies made of any new charts or hydrographic information. He will keep a file of all the hydrographic notices, notices to mariners, and hydrographic information that he receives. He will cause careful surveys to be made, and charts constructed, of any shoals, dangers, or harbors not correctly located, or which may require examination; and, when completed, he will forward them, with all the original data and computations, to the Bureau of Navigation. When passing in the vicinity of doubtful dangers, or where there is an indication of shoal water or danger not on the charts, he will make, unless there be special reasons to the contrary, such search as the weather and other circumstances permit, and will forward the results to the Bureau of Navigation, with a track-chart of the traverses made, soundings taken, etc., and in general fulfill the conditions indicated by the hydrographer for making such examinations.

In a port where there is not a consul of the United States, and on the high seas, commanders of fleets, squadrons, and of single vessels are authorized and empowered by law to exercise the powers of consuls, in regard to mariners of the United States.

Commerce, Modern. The commercial activity of nations has in all ages been taken as constituting a fair measure of their development in civilization, and in most cases the organized international exchanges comprehended in this single word have formed the direct civilizing agency. Asiatic history affords exceptions to this generalization, undoubtedly, if we admit that the ancient Indian and Chinese civilizations can claim any rank with those of modern times in Europe and the West; and again, with Rome there was a form of national energy capable of great results, yet having little in common with the civilization of Europe even in the middle ages. As these ages develop, and as Europe becomes a family of nations, the function of commerce rises to the highest place as a law of development, until now the most powerful agencies of internal movement in every country are no more than equal to the strictly commercial systems of exchange conducted between nations. No one country is independent of the necessity to exchange its products with those of other countries. No people, whatever their nationality or origin, can isolate themselves from other peoples. A force superior to all others compels them to come into the general family of nations, to exchange their products and their services with all others, and to recognize a common interest which no one of them can resist.

Modern commerce is the commerce of even the most recent times greatly intensified, and active to a degree only recently rendered possible. The steamship, as a freighting vessel, is new within a very few years, and the fleets of steamers now almost daily laden for transatlantic trade are scarcely yet known to the country as the facts of magnitude they are. The actual commerce of the United States with Europe conducted by these steamer fleets is enormous, and it increases with a degree of rapidity greater than is represented by the growth of either continent; that is, the demand for these exchanges is itself increasing independently of the increased production of the articles or quantities exchanged. A larger proportion of the wheat crop and of the corn crop of the United States is now demanded and consumed in Europe than at any previous time, and the proportion sold abroad will be still greater hereafter. It is so with many other staples of export, with provisions and meats, with lard, cheese, butter, petroleum, and many other articles. The original inquiry or experiment as to the salable value of any one of these commodities has changed to an imperative necessity for these articles as staples of consumption, and this necessity cannot be delayed or denied. The nations of Europe cannot now dispense with the supply of food furnished by these steam fleets laden with grain and provisions. In place of the hesitating choice with which they were taken but a few years ago, the various forms in which corn is prepared are now unquestionably accepted as a staple food for all classes, and the shipments during the current year are consequently one-third greater than ever before. Having established the position of Indian corn as the best and cheapest grain food for Europe, we need not again apprehend its waste by using it as fuel. Nor will the freight-carrying lines of the interior fail to find a profitable business in moving it across the country to the sea-board.

This outward movement already constitutes a circulation altogether vital to the security of business. If this circulation is clogged or stopped, even for a day, it affects the greatest interests. A week of obstruction would bring on a financial panic, entailing enormous losses, and becoming general in its effects on all other business interests. The value of the export movement is now felt by every farmer in the Mississippi Valley, and the sense of international dependence is keenly felt at every railroad station in the west. Much of the advantage resulting to all the parties to these exchanges is due to the perfection attained in economically handling these staples, and to the triumph over time and distance achieved by railroads and freighting facilities as they now are. If these had not been greatly improved, the value of meats and grains would be eaten up by the cost of transit, and the western producer would have little for the articles themselves. As it is, however, the perfection

attained in freighting is wonderful, both inland and at sea, and the provisions sent to Europe are worth all they cost to the ultimate consumers.

The weekly export of general merchandise—grain and provisions being the chief articles—is now about 10 millions of dollars in value at the port of New York alone, and this average has been maintained now for several months. The highest shipment on a single day was 1,254,500 bushels of grain, wheat, and corn—a quantity nearly approached on one or two other days, and likely again to be reached at any time.

It will be seen by these illustrations that commerce in general has assumed proportions which strikingly illustrate the greater productive capacity of the present age, and the efficiency of all the appliances of business. It could not exist if agricultural production remained where it was twenty-five years ago, nor if railroads, elevators, and steamships were the same as then. It could not supply the necessities of nations with any less efficient machinery than that now in use, and we pass on to these changes and improvements in a great degree unconscious of the magnitude of the general movement.

The following table, giving the aggregate values of merchandise imported into and exported from the United States for ten years, will show the rapid increase now taking place,—the years ending June 30 in each case:

	Value of Imports.	Value of Exports.
1870	$462,377,587	$499,092,143
1871	541,493,708	562,518,651
1872	640,338,376	549,219,718
1873	663,617,147	649,132,563
1874	595,861,248	693,039,054
1875	553,906,153	643,094,767
1876	476,667,871	644,956,406
1877	492,097,540	676,115,592
1878	466,872,846	722,811,815
1879	466,073,775	717,093,777
1880	760,919,875	852,845,943

For the last year—1879–80—the importation of a large amount of gold adds an unusual value to the imports, the merchandise account being *imports* $667,885,565, and the *exports* $835,793,924. The gold and silver coin imported reached the large sum of $93,034,310; the gold and silver exports being $17,142,919. For other years of the table there was little difference between the exports and imports of gold.

This period embraces at least one of the complete cycles of foreign trade characteristic of this country in the great increase of business of 1872 and 1873, followed by the depression of 1874 to 1879. Again, there was a remarkable change in 1879, bringing in a fresh flood of importations in 1880 of more than one hundred millions in value greater than in the previous year. Generally, while the imports have decreased in value, and in some classes of goods have almost ceased to come in as part of the necessary supply, the exports have increased one half, rising from 500 millions in 1870 to 750 millions in 1880. To go a few years farther back the contrast would be still more striking: the average for several years near to 1860 would be about 300 millions; for 1870, about 500 millions; and for 1880, about 750 millions. And in 1879 and 1880 there has been a total cessation of the usual large specie exports, very little being sent, while during 1879 the imports of specie were large, being about 80 millions in excess of any other recent year.

The increase of shipping in the carrying trade is even more decisive, the total tonnage capacity of vessels entering all the ports of the United States from foreign countries being, for

1870	6,270,189	1875	9,143,338
1871	6,994,187	1876	9,715,904
1872	7,769,986	1877	10,406,488
1873	8,394,749	1878	11,530,527
1874	10,009,655	1879	13,772,360

For 1880 the figures would be still larger, and it may be stated that the shipping engaged in foreign trade has doubled within ten years. There would be more satisfaction with this result if the increase had been in American vessels; but, on the contrary, it is almost wholly foreign. The vast fleet of half-employed foreign steamers has been turned into the transatlantic trade with the United States by wholesale, as the best-paying trade of the world, and the only one that offers unlimited opportunity for expansion.

The new transatlantic fleet of steamers is almost wholly under foreign flags. Of the entire tonnage arriving at New York not one steamship is American, and but four of those at other ports, these four belonging to the American line between Philadelphia and Liverpool. The contrast between the nationality of vessels under sail and those under steam is extreme, and it results from the narrow and sordid policy of Congress in regard to the encouragement of steam lines. All European nations faithfully and persistently support the steamship lines, through which alone a successful foreign commerce can now be conducted, and our government, on the contrary, with equal stubbornness and persistence, refuses not only all assistance, but all recognition as vessels under the protection of the United States. The result is that, with a trade the richest in the world, and a vast and daily increasing commerce, we are defeated the moment we leave our own shores.

The commerce of Europe has become more general and more decisive in its influence on remote countries with every step of its general progress. The establishment of regular steamship lines to all countries affording a constant trade was the greatest step of progress, and with its accompanying certainty of mail carriage and of passenger transportation, it has now for twenty years or more constituted the most powerful civilizing agency the world has known. This triumph is almost wholly to be credited to England, as the originator of the steam mail-service by sea, although every other maritime nation has followed the example set by England more or less remotely, several European countries maintaining effective lines of distant service, but none approaching the English in number. Great and regular lines to the Indies, and by the way of the Indies to Australia, were established, and continue as the leading feature of the British mail service; next are the South American and transatlantic lines, South America being reached by lines passing the French and Spanish coasts, and touching at Havre, Bordeaux, Lisbon, and the Azores on their way to Pernambuco; thence to Rio Janeiro and the River Plate, and with extensions through the Straits of Magellan to the west coast of South America, Chili, Peru, Ecuador, and Panama. No less than ten lines of steamers ran in 1877 to 1879 from European ports to South America,—five

English, employing 58 vessels, and five German, French, and Italian, employing 43 vessels,—all being steamships of large capacity and heavily freighted in both directions. The Royal Mail Steamship Company, the oldest of the lines, ran 10 vessels from Southampton to Rio Janeiro and the River Plate, monthly and semi-monthly; the Pacific Steam Navigation Company, with the same number of vessels, ran through to the west coast of South America with a monthly service; the Allan Line, to Brazil, with 10 vessels; the Liverpool, Brazil, and River Plate, with 20 vessels; and the Clyde Line, with 6 vessels, complete the English list. The North German Lloyds and the Hamburgh and South American constitute two German lines; the "Chargeurs Reunis," the "Compagnie Messageries Maritimes," and the "Société Générale Trans-Atlantique," constitute the French lines; and one Italian line, from Genoa, completes the list.

This is an illustration of the extent and completeness of the mail steamship service of modern commerce. It extends to every country having sufficient development to justify communication with Europe, and it radiates from English ports almost universally, although duplicated to a considerable extent from French, German, and Belgian ports. There is always an English line, and there may be, in addition, a French, German, or Italian line. Neither of these last has any general field exclusive of the English. In all this service the United States have no part, except in the "American Line" of four steamers from Philadelphia to Liverpool, and the line of John Roach & Co., of three steamers, from New York to Rio Janeiro. Neither of these lines receives especial recognition or compensation for mail service, although both carry some portion of the mails. Repeated efforts have been made to establish lines, or to obtain from Congress authority for conducting a mail service by sea, but in only two instances have such efforts been successful, and the authority under which they were conducted has some years since expired. The Pacific mail service is now paid by the Australian governments of New South Wales and New Zealand, these two colonial governments uniting in payment for a monthly mail service from Sydney and Auckland to San Francisco, the withdrawal of which would compel a discontinuance of that branch of the Pacific mail steamship service.

Such is the commerce of the present time, briefly reviewed. It is unquestionably in a transition state, and certain to undergo great changes within a comparatively brief period. These changes will not be in the direction of diminished volume or of inferior appliances, but they will probably exhibit a higher and more general appreciation, in the United States at least, of the true function of commerce itself, and a recognition of the duty of every great government to maintain its own proper relation to the necessary exchanges of the world.—*Lorin Blodgett.*

Commission (Lat. *committere*, to commit, to intrust). An instrument in writing in the form of a warrant, or letters patent; a certificate of rank. The chief executive, or the supreme authority of the state, issues commissions to the officers of the army and navy, by virtue of which they hold office and exercise the duties thereof. Such officers are termed commissioned officers to distinguish those of the navy from *warrant*-officers; those of the army from *non*-commissioned officers. By Section 1467, Revised Statutes, line-officers take rank in each grade according to the dates of their commissions.

A commission survives only during the pleasure of the authority whence it emanates. The Duke of Marlborough, while at the height of his power, exerted all his great influence to have his commission as captain-general extended for life; but the lord chancellor of England, having searched the records in vain for a precedent, declared that "a patent for life would be an innovation, to which he would not put the Great Seal" (Earl Stanhope's "Reign of Queen Anne"). It was found that the commission issued to Monk, who as "Restorer of the Monarchy" might claim especial privilege, was made to continue "during pleasure" only. Not satisfied with this decision, Marlborough, during the campaign in Flanders, addressed a personal letter to Queen Anne praying to be made general for life. To this the queen, on consulting with her ministers, returned a positive refusal.

The commission issued to Washington by Congress under date of June 19, 1775, giving him the rank of commander-in-chief of the American army, stated that it was "to continue in force until revoked by this or a future Congress."

Following immemorial custom, all commissions issued to officers in the public service of the United States contain the following: "This commission to continue in force *during the pleasure* of the President of the United States for the time being."

In past years the President of the United States has, on several notable occasions, actually exercised his prerogative, by summarily dismissing officers. But Congress has now limited that power to a time of war. Article 36 of the Articles for the Government of the United States Navy, commonly known as the Articles of War, declares that "No officer shall be dismissed from the naval service except by the order of the President or by sentence of a general court-martial; and in *time of peace* no officer shall be dismissed except in pursuance of the sentence of a general court-martial or in mitigation thereof." Congress has further decreed that under certain conditions the President's order of dismissal shall be void. (Act of June 22, 1874.)

A commission sometimes includes a number of persons associated together for some particular object. The commission issued by Queen Victoria (1858) to Earl Hardwicke and eight others, "to inquire into the best means of manning the Royal Navy," led to the present admirable system of training boys for that navy.

The act of putting a vessel of war "in commission" is accomplished by hoisting, in their appropriate places, the national colors and the pennant of the commanding officer. The commanding officer then assembles the officers and crew, and reads to them the order by virtue of which he assumes command.—*S. B. Luce, Captain U.S.N.*

COMMISSIONED OFFICER. An officer holding a commission from the President, as distinguished from non-commissioned and warrant-officers.

Commissioners, Board of Navy. In 1815

Congress authorized the formation of a board of navy commissioners, which was placed under the superintendence of the Secretary of the Navy, and was charged with all the ministerial duties of the department relating to the procuring of supplies and stores, the collection of materials, the construction, armament, and employment of all the vessels. Commodores Rodgers, Hull, and Porter were appointed the first commissioners. The board was abolished in 1842. See ADMINISTRATION, NAVAL.

Commissioners of the Navy (*Eng.*). Certain officers formerly appointed to superintend the affairs of the navy under direction of the lords commissioners of the Admiralty. Their duty was more immediately concerned in the building, docking, and repairing of ships in the dock-yards; they had also the appointment of some of the officers, as surgeons, masters, etc., and the transport, victualing, and medical departments were controlled by that board. It was abolished in 1831. See ADMINISTRATION, NAVAL.

Commodore. This rank of no remote date in the British service, and only now a brevet rank, so to speak, for a captain in command of a squadron or a division of a fleet, is not noticed in the dictionaries of the 17th century. It is supposed to be derived from the Spanish "*Comendador*," one having command over others, or a company.

Until 1861 captains in the United States navy commanding, or having commanded, squadrons, were recognized as commodores, though never commissioned as such, and wore a broad pennant distinctive of that rank. In 1862 it was established by law as a fixed rank, and in July of that year 18 were commissioned on the active and 17 on the retired list.

A commodore has assimilated rank with a brigadier-general of the army; and the chief naval constructor, paymaster-general, surgeon-general and engineer-in-chief of the navy, bureau officers, rank with commodores.

A commodore may command a division or a squadron, or be chief of staff of a naval force commanded by an admiral, a vice- or rear-admiral; or may command ships of the first class, naval stations, or the vessel of an admiral, vice-admiral, or rear-admiral commanding a fleet.

Companion. The skylights or framing and sash-lights on the upper deck, by which light passes to the deck below. A kind of wooden hood over the staircase of the cabin in small ships. Companions are generally movable.

COMPANION-LADDER. The ladder by which the cabin-officers ascend to or descend from the quarter-deck.

COMPANION-WAY. The staircase or berthing of the ladder-way to the cabin.

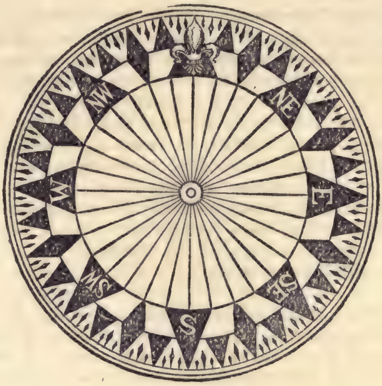
Comparison. The difference between the chronometer and the time-piece used in an observation. *To take a comparison* is to ascertain the difference between the time-piece and the chronometer; this should be done just before and just after the observation.

Compasant. See ST. ELMO'S FIRE.

Compass, The Mariner's. This is probably the most important of all the instruments employed by the navigator, and consists essentially of the *card*, the *needle*, and the *bowl*. It is used for the purpose of pointing out the direction of the ship's track, or the course upon which she is sailing, and is supposed to derive its name from the fact that it includes or *compasses* the whole plane of the horizon.

The card (Fig. 1) is of a circular form, divided

FIG. 1.



at its circumference into thirty-two points of eleven degrees and fifteen minutes each, the points being subdivided into half and quarter points, and when a still smaller division is desired, into degrees. It is also divided into four quadrants of ninety degrees each, the extremities marking these quadrants being called the four *cardinal* points, or north, east, south, and west (written N., E., S., and W.), counting from the top of the card and going around by the right hand, or in the direction in which the hands of a watch move. The north point of the card is generally marked by a *fleur-de-lis.*

The quadrants are again equally divided at every four points, or forty-five degrees, the points marking these subdivisions being given names compounded of the names of the two cardinal points between which they fall, or northeast, southeast, southwest, and northwest (written N.E., S.E., S.W., and N.W.).

The eight points already described may be called the eight *principal* points of the compass.

The points half-way between the four cardinal points and the points N.E., S.E., S.W., and N.W. are given a name composed of the nearest cardinal point and the points last named. Thus, the point midway between N. and N.E. is called north-northeast (written N.N.E.), that between N.E. and E. east-northeast (written E.N.E.), etc., the name of the cardinal point nearest which they fall always coming first.

The points *next* the eight principal points take the word *by* between such principal point and the next cardinal point, the name of the principal point next which they fall coming first. For example, the point next to N. on the right is north by east (written N. by E., or N. b. E.), that next to N.E. on the right, northeast by east (written N.E. by E., or N.E. b. E.), etc.

The quarter point next to N. on the right is north a quarter east (written N. $\frac{1}{4}$ E.), the half point north a half east (written N. $\frac{1}{2}$ E.), the same general rule being observed as in naming the whole points.

In many cases the bearings of objects are given to eighths of a point.

The name of the opposite point to any given point is known at once by simply reversing the name or the letters which indicate the name of the given point. Thus, the opposite of N. being S. and that of E., W., the opposite point of N.E. is S.W., that opposite N.E. by E., S.W. by W., etc.

If the impressions of the card are taken on paper, this should be done after the paper has been cemented to the plate forming the basis, in order to prevent distortion from shrinkage, and also to attain a more perfect centring. This being accomplished, the card is placed upon the *needles*, which consist of laminæ, or layers, of hardened steel, capable of receiving and retaining a high degree of magnetic power. The needles are fastened at equal distances to a light frame-work of brass, and are screwed to the card in a direction parallel to the line joining the north and south points.

In the best form of *air* or *dry* compasses, that used in the English navy, and known as the *Admiralty pattern*, these needles are four in number, the two centre ones being about 7½ inches long and the two outer ones about 5¼ inches. The extremities of these needles are 15° and 45° from the extremities of the diameter of the card which is parallel to them. On the needles small brass balancing-slides are placed, so that the card may be restored to its horizontal position when affected by *dip*. These slides should move freely, but should have sufficient friction to retain them in their places.

Two cards, a light and a heavy one, marked respectively A and J, are supplied with this compass, the former being for ordinary use when the ship is comparatively steady, and the latter for use when there is a great deal of motion. The light card is balanced on a pivot having a point of "native alloy," which is harder than steel, and does not corrode on exposure to the atmosphere. Two spare pivots of hardened steel are also furnished for the light card, and these are gilded by an electrical process. The caps in which these pivots work are centred with ruby or agate, while the cap of the heavy card is centred with speculum metal and ruby-pointed pivots are used.

The pivot should be screwed into the exact centre of the *bowl*, which is made of strong copper, with a glass top, and fitted with gimbals, so that the card may always preserve a horizontal position even when the motion of the ship is most violent. The intersecting point of the axis of the gimbals must coincide with the centre of the card and with the centre of the *azimuth circle*. This latter is a metal circle, graduated to minutes of arc, and fitted with a prism and a sight vane, the latter having a wide opening in which is placed a vertical hair-line exactly opposite the centre of the prism, the line of sight joining the two passing over the pivot. The azimuth circle is made to ship on the circumference of the bowl, and is used in taking bearings. Colored glasses are also fitted to the circle to prevent the glare of the sun from blinding the observer when taking bearings of that body. The azimuth circle is only fitted to the standard compass, the binnacle, or steering compasses, being unprovided with it.

The bowl and the compass-card are placed in a wooden box and the whole in a *binnacle*, which consists of a wooden case mounted on a stand, the top being of brass, fitted with glass, so that the card may be seen, and having lamps at the sides to light up the card at night.

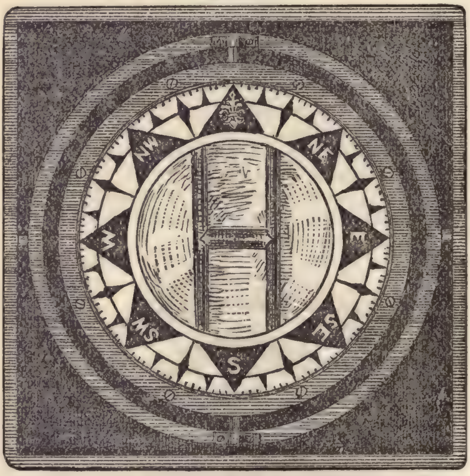
The pivots, caps, and margins of the card should be frequently examined to see that they are in good order and working freely, and when the card works sluggishly or injury from any cause occurs, a new cap or pivot should be screwed in, being careful when screwing the pivot into the bowl to preserve its point from injury and to place the card lightly upon it. When the bowl does not work freely in the gimbals, the axes of the latter and their bouchings should be examined, and, if necessary, slightly rubbed with plumbago. No oil, grease, or other fatty substance should be used for this purpose.

In addition to the fittings already described a screw is fitted to the side of the bowl, by means of which the card may be lifted off the pivot and clamped. When it is necessary to move the compass, or when firing the heavy guns, the card should be raised to avoid injury to the pivot.

The screws attached to the prism plate and to the sight vane receive special adjustment, and should not be touched.

Ritchie's Liquid Compass (Fig. 2), which is used as the regulation compass in the United

FIG. 2.



States navy, consists of a skeleton card mounted on a pivot, and having the bowl filled with a liquid composed of thirty-five parts of alcohol and sixty-five parts of distilled water, the freezing-point of the mixture being about —10° Fahrenheit. In the bowls of the compasses designed for use in the Arctic regions pure alcohol is used.

The needles, which are two in number, each consist of six laminæ of a superior quality of steel, known in commerce as "Stubb's sheet," this having been found the best for the purpose, not only for its uniform excellence, but for its magnetic capacity in both intensity and permanence. Each of these laminæ is six and a half inches long, seven-sixteenths of an inch wide, and about one-fortieth of an inch thick, and each needle weighs a little less than two ounces.

These needles are inclosed in two parallel tubes, which serve also as air-chambers, the tubes being parallel to the line joining the N. and S. points of the card, their ends meeting the rim a little within 30° of this line. These tubes are connected at the centre by a third hollow tube at right angles to them, which supports the cap upon which the card is pivoted. The rim is fitted to form another air-chamber, thus giving great buoyancy to the card.

Great care is exercised in hardening and tempering the laminæ, and, by means of a powerful electro-magnet, they are magnetized to saturation. They are then separately tested for relative magnet power, and the angle of deflection marked on each. Afterwards they are thrown promiscuously into contact for a short time and again tested, any which show a sensible falling off being rejected.

These compasses have given great satisfaction in use, and are found to possess in the highest degree the three great requisites of a good compass, viz., *directive force*, *sensibility*, and *steadiness*. The 7½-inch has been adopted as the regulation size in the navy, and as the azimuth circle that fits one fits all, any compass may be used indifferently as a standard or as a steering compass.

Another great advantage possessed by these compasses is that the pressure on the pivot being only about seventy grains on an average, there is much less frictional error, and of course a much less degree of wear on the caps and pivots than with the card of the air compass, in which the pressure on the pivot with the heavier card may be sixty times as great.

In the tell-tale compasses, which are mounted face downward, the pressure on the pivot is so regulated as to act upward.

Duchemin's Compass (Fig. 3) consists of two concentric circular needles with a steel traverse

FIG. 3.

connecting the poles. The maximum magnetization (shown by the heavy shading) is at the N. and S. points, decreasing gradually to zero at E. and W. The circle is magnetized by a special process, which gives magnetic stability, and placed upon a pivot or suspended by a thread from the centre, it forms a true compass, the N. pole pointing to the south and the S. pole to the north.

In a series of experiments made at sea with this compass, in which it was intentionally exposed to the roughest usage, it proved so satisfactory with regard to sensibility, steadiness, and fixity of the line of its poles, that it has been adopted as the regulation compass in the French navy, and is in use in several lines of merchant steamers.

The magnetic needle is subject to the influences of variation or declination, dip or inclination, and deviation.

On account of the magnetic attraction of the earth there are but few places on the globe at which the compass-needle points to the true north, or in the direction of a terrestrial meridian. The direction that the horizontal needle assumes when uninfluenced by local causes is called the *magnetic meridian*, hence the variation of the compass is the angle included between the terrestrial and the magnetic meridians, and is measured by the number of degrees between the true and the magnetic north. If the N. end of the needle is drawn to the right hand of true north, the variation is called easterly, and if to the left hand, westerly.

The variation of the compass differs at different places, and is constantly, though slowly, changing at the same place, increasing for a certain time, then slowly decreasing for a period, when it again commences to increase. Thus, at Paris, in 1550, the variation was 8° E., in 1660, zero, and in 1769, 20° W. It is also subject to mensual and diurnal changes, the mensual change being according to the season of the year. It was first noticed about the year 1756.

In the diurnal change, a small easterly movement of the needle is observed during the early morning hours, reaching a maximum about 7 A.M. After that time the N. end moves rapidly westward, reaching its extreme westerly position at about 1 P.M. It then returns to the eastward, but more slowly, the easterly deviation becoming a maximum at about 10 P.M. To seamen, however, these small fluctuations are unimportant. The mean daily range of the magnetic needle is about 9.3′.

The needle is also affected by sudden changes in the direction and intensity of the magnetic force. Raper cites a case in which, at Greenwich observatory, the needle was observed to change its direction more than 2½° in eight minutes of time, and similar effects were observed at other places. These sudden disturbances are called *magnetic storms*.

If all places having the same variation be united by lines drawn upon the chart, these lines will be found to describe irregular curves, called lines of equal variation, or isogonic lines. The lines uniting places at which the needle, when uninfluenced by local causes, points to the true north are called lines of no variation, or agonic lines.

The discovery of the variation of the needle from the true north is usually attributed to Columbus during the voyage in which he discovered America, but in one of the earliest treatises on magnetism, written in 1269, the variation of the needle is spoken of. The authenticity of this work has, however, been questioned.

The magnetic needle when placed on a pivot will not retain its horizontal position except on

the magnetic equator, the N. end of the needle dipping and the S. end rising in N. magnetic latitudes, and the S. end dipping and the N. end rising in S. magnetic latitudes. This inclination of the needle to a horizontal plane or to the horizon is called the *dip*, or inclination of the needle, and is different at different places according to their magnetic latitude. The dip, like the variation, undergoes a continual change, which is, however, very small in amount, the decrease at London in the last three hundred years amounting to no more than about four degrees. There is a diurnal change amounting to three or four minutes. Lines drawn on the chart to unite places having the same dip are called lines of equal dip, or isoclinal lines. On the magnetic equator the dip is zero, and at the magnetic poles it is 90°. It is found by means of the dipping-needle, a very delicate instrument. The dip being in some degree a measure of the intensity of the earth's magnetism as well as materially modifying the directive force of the needle, is a matter of great importance to the mariner. At the magnetic poles, where the needle is perpendicular, it has of course no directive force, although at these points the greatest magnetic intensity is developed. The dip was first observed by Robert Norman, an English compass-maker, in 1576.

The Magnetic Equator, of which we have already spoken, is an irregular curve, cutting the terrestrial equator in three points according to some authorities, in four according to others. From the magnetic equator magnetic latitude is reckoned, and at any point on it the magnetic needle will retain its horizontal position, or there will be no dip.

As this curve does not coincide throughout with the terrestrial equator, magnetic latitudes do not correspond everywhere with the common or geographical latitude, differing at some places as much as 13°.

The Magnetic Poles are two spots on the surface of the earth, one in the northern and the other in the southern hemisphere, at which the needle points directly downward, or at which the dip is 90°. The present position of the south magnetic pole is about lat. 70° N., lon. 98° W., and of the north magnetic pole, lat. 74° S., lon. 148° E. The change in the variation previously mentioned has been ascribed to the revolution of these poles around the poles of the earth.

The Deviation of the Compass may be defined to be the angle which the needle makes with the magnetic meridian, and is measured by the number of degrees between this meridian and the line of direction of the needle. It is marked east or west as the N. end of the needle is drawn to the right or left of the magnetic meridian.

The deviation of the compass is caused by the action on the needle of the iron in a ship, whether employed in her construction, equipment, or cargo, and by the action of magnetic forces without the ship, such as exist in volcanic bodies, iron cranes, water-pipes, or in anything that can exert a magnetic influence on the needle. The magnetic influence which one iron ship can exercise upon the compasses of another in close proximity is very appreciable. Lightning may affect the compass needle.

There are different methods of finding the error due to these causes, a description of which will be found in almost any work on navigation, but all consist in bringing the ship's head in succession to each of the thirty-two points of the compass, and then observing the bearing of some object, either celestial or terrestrial, whose true bearing is found either by calculation or by the inspection of tables prepared for the purpose. The difference between the true bearing so found and the bearing shown by compass, *after the variation due to the place has been applied to the compass bearing*, is the error due to local deviation.

As the local deviation differs in iron ships when the ship is on an even keel and when heeling, it should be determined under both circumstances, and in steamers, if this error has been determined with the funnel up, a few bearings should be taken with it down, when, if any considerable difference is observed, the errors should be obtained for both positions of the funnel.

The deviation may be found by bringing the ship's head on every other point of the compass, or even on the eight principal points, the error on the omitted points being obtained by interpolation. Graphic methods of representing the deviation have been devised, the best being that of Napier and the right-line method of Archibald Smith.

After finding the deviation on all the points of the compass, these errors may be either tabulated or the compass may be compensated by means of magnets placed in the deck near the compass. In some iron vessels, where the deviation on particular courses is very large, a combination of the two methods is used, the errors being partially compensated by magnets and the residual error being found by observation and tabulated.

Both methods, the compensation and the tabular, have their advocates. In the United States navy, as well as in the navy of England, uncompensated compasses are used, and the deviations given from the deviation table are applied to the compass courses to find the correct magnetic course steered or to steer. Many merchant vessels use compensated compasses.

As the deviations found for the compasses of a vessel are only good at the place where found, and change, from a variety of causes, after any considerable lapse of time or after considerable change of position, it frequently becomes necessary to move the magnets by which the compensation is effected in order to compensate for the new deviations found. Great difficulty is sometimes experienced in doing this as the magnets are ordinarily fitted. To obviate this difficulty, as well as to furnish a compass possessed of great steadiness and small frictional error, Sir William Thomson has designed an instrument which, while possessing all the qualities of a good compass, can be readily and quickly adjusted for changes of deviation, and which may be described as follows:

The compass-card (Fig. 4) is supported on a thin rim of aluminium, and its inner parts on thirty-two silk threads or fine copper wires stretched from the rim to a small central boss of aluminium. The card itself is of thin, strong paper, and all the central parts of it are cut away, leaving only enough to show conveniently the points and degree divisions of the compass.

The central boss consists of a thin disk of

aluminium with a hole in its centre, which rests on the projecting lip of a small aluminium in-

FIG. 4.

verted cup mounted with a sapphire cap, which rests on a fixed iridium point. Eight small needles from 3¼ to 2 inches long, made of thin steel wire, and weighing in all 54 grains, are fixed like the steps of a rope ladder on two parallel silk threads, and slung from the aluminium rim by four fine copper wires through eyes in the four ends of the outer pair of needles.

The weight of the central boss, aluminium cup, and sapphire cap amounts in all to about 5 grains. It need not be more for a 24-inch than for a 10-inch compass. For the 10-inch compass the whole weight on the iridium point, including rim, card, silk thread, central boss, and needles, is about 180 grains.

By throwing the greater part of the weight of the card to its rim a long period of free oscillation and consequent steadiness is insured, and, owing to the small pressure on the pivot, due to the lightness of the card, there is almost absolute freedom from frictional error. There is a hemispherical space under the compass-case, which being nearly filled with castor oil, serves to calm the vibrations of the bowl.

The apparatus for correcting the error of the compass consists of two solid or hollow iron globes placed on proper supports, and attached to the compass on two sides of the binnacle. These are for the purpose of correcting the quadrantal error, or that caused by the difference of the induced magnetism in fore-and-aft and thwartships horizontal iron. This adjustment having been once made remains correct in all latitudes, unless there is some change in the place of the iron near the compass. To make the correction the globes are placed at a certain distance from the centre of the compass, according to the amount of the deviation to be corrected.

For correcting the semicircular deviation, or that caused by the magnetism of the ship and the induced magnetism of her vertical iron, which changes with lapse of time and with change of latitude, sets of magnets are so arranged in the binnacle as to neutralize the disturbance arising from this cause, as well as that caused by the heeling error. For this latter a vertical magnet, adjustable to the proper height, in a line perpendicular to the deck, through the centre of the compass and of the binnacle, is used.

The inventor has also applied to this compass an azimuth mirror on the principle of the camera lucida, by which the bearings of objects on the horizon can be taken, even if the highest point of the globes used for correcting the quadrantal deviation rises as high as 5 inches above the glass of the compass-bowl. By means of this mirror the readings are taken directly on the card, and it possesses the advantage of not requiring any adjustment of the instrument, such as that by which, in the ordinary azimuth compass, the hair is made to exactly cover the object.

The deviation of the compass-needle was observed by Mr. Wales, who accompanied Capt. Cook as astronomer, in the latter half of the 18th century, but no effort seems to have been made at that time for its correction, it having probably been ascribed to the imperfection of the instruments then employed.

The first attempt to correct the deviation appears to have been made by Capt. Matthew Flinders, who observed it while on a surveying expedition to Australia in the beginning of the present century. He suggested the introduction of an upright iron stanchion so placed as to counteract the ship's attraction, and the explanation which he then gave of the action on the needle of the ship's iron has formed the basis of all subsequent investigation.

The Chinese were perhaps the first people who possessed a knowledge of the properties of the magnetized needle. We are told that as early as 2634 B.C. these people possessed an instrument which would indicate the S. point, thus distinguishing the four cardinal points. Other allusions to the compass are also made in old Chinese records, proving its great antiquity among them.

The Chinese compass has a distinguishing mark at the S. pole instead of at the N., as with us. The needle is seldom more than an inch in length, and is less than a line in thickness. It is peculiarly poised, with its point of suspension a little below its centre of gravity, and is very sensitive. The card has but twenty-four points, reckoned from the S. pole.

The improvement of the mariner's compass has been but a slow process, and during the last forty years it has been brought to a greater degree of perfection than during all of the previous period in which it has been known. During the last few years the introduction of iron in the construction and equipment of vessels has stimulated investigation in order to detect the causes of the vagaries of the needle, and to apply a remedy which should make the compass an instrument upon which reliance could be placed.

Some of the most eminent scientific men of the present day have devoted their energies to the task, and the result is a great improvement in our knowledge of the laws of magnetism as affecting the compass-needle, and in the construction of the compasses now in use.

See the various works on Magnetism and on Navigation. Also, "English Philosophical Transactions; Magnetism of Ships and Deviation of the Compass," republished by the Bureau of Navigation in 1867, especially the article on

the Mariner's Compass from the *London Quarterly Review* for October, 1865; "Naval Science," vol. ii., 1873, articles on Deviation of the Compass; "Elementary Magnetism and Local Attraction of Ship's Compasses," Sunderland, Thomas Reed & Co.; "Finding of the Compass Error," by B. F. Greene, Professor U. S. Navy; Towson on the "Deviation of the Compass in Iron Ships;" "Encyclopædia Britannica," article Compass; "Reports of the Liverpool Compass Commission," republished by the Bureau of Navigation in 1868, etc.—*Charles H. Black, Lieutenant-Commander U.S.N.*

COMPASS, ADJUSTMENT OF. See COMPASS, THE MARINER'S.

COMPASS, AZIMUTH. A compass of superior construction fitted for taking bearings.

COMPASS BEARING. The bearing of an object as taken by the compass. It is distinguished from the *true bearing*, which may be deduced from it by applying the corrections for *variation* and *deviation*. See BEARING.

COMPASS CORRECTIONS. Those quantities which must be applied to directions shown by the needle to give the true directions. There are two such corrections: the *variation* and the *deviation*. See COMPASS, THE MARINER'S.

COMPASS COURSE. The angle which the ship's track makes with the direction of the magnetic needle of the compass. It is distinguished from the *true course*, which may be deduced from it by applying the corrections for *variation* and *deviation*. The correction for *leeway* is also necessary to deduce the course made good from the course steered. See COURSE.

COMPASS, IMPERFECTIONS OF. 1. The pivot must be in the centre of the graduated circumference of the card.

2. The eye-vane and object-vane must each be vertical.

3. The direction of the magnetism of the needle must be parallel to the longitudinal line of the needle.

4. The line joining the eye-vane and object-vane must pass directly over the centre of the card.

The effects of non-conformity with the last two requirements can be ascertained and allowed for, but a failure to meet either of the first two should cause the rejection of the instrument.

COMPASS, STANDARD. One raised above the deck, so that the local deviation will be small and the compass in a good position for observing bearings.

COMPASS, STEERING. The compass by which the vessel is steered. The course is given as per standard compass, and the proper allowance for the difference is made by the officer of the deck.

Compass-timber. Curved or crooked timber.

Complain. When the masts, timbers, blocks, etc., creak, and thus show that there is some internal defect, they are said *to complain*.

Complement. The number of men composing a ship's crew.

Composite Sailing. A combination of parallel and great-circle sailing. See SAILINGS.

Composite Ship. One having a wooden skin and an iron frame-work. Jordan's system is as follows: the whole outer skin, including stem, keel, stern-post, and planking, is of wood; and the frames, beams, kelson, shelf-piece, braces, etc., are of iron. See SHEATHED SHIP.

Compound Engine. A modification of steam-engine in which the steam, having performed a certain amount of work in one cylinder, is admitted to another cylinder of larger dimensions, where additional work is obtained from its remaining expansive force. The primitive method was patented by Hornblower in the year 1781, and improved by Wolf in 1804, by the adoption of higher steam-pressure applied to Watt's expired patents of the double-acting cylinder and separate condenser; and the principle was first introduced on a large scale by Randolph, Elder & Co., of Glasgow, under their patents of 1856, in the steamships "Callao," "Lima," and "Bogota," of the Pacific Steam Navigation Company. Crude as the design was, and using comparatively low-pressure steam, the economy observed, which was 2¼ pounds of coal per hour per indicated horse-power under circumstances when 3½ pounds consumption was considered an excellent performance, caused the system to gradually grow into favor, and it is now almost universally adopted.

In the year 1850 the average of the voyages of the Cunard steamships with plain engines was 13 days outward bound, and 12 days, 16 hours homeward bound; and in 1877 the average of the "White Star" line, with compound engines, was 8 days, 13 hours, 39 minutes outward bound, and 8 days, 10 hours, 30 minutes homeward bound.

The "Gallia," the latest steamer of the Cunard line, made her first voyage from Queenstown to New York in 7 days, 19 hours, under the following conditions:

VESSEL.

Length of keel	430 feet.
Length all over	450 "
Breadth of beam	44 "
Depth of hold	36 "

ENGINES.

Number cylinders, one H. P. and two L. P.	3
Diameter of H. P. cylinder	63 inches.
" " each L. P. cylinder	80 "
Stroke of pistons	5 feet.
Greatest diameter of crank-shaft journals	21 inches.
Cut-off valves on high-pressure cylinder.	
Condensing surface	8,300 square feet.
Condenser tubes, ¾ inch diameter, 9 feet long.	
Independent circulating pumps (Gwynne's).	
Propeller, steel-bladed; weight	24 tons.

BOILERS.

Number of boilers	8
Diameter "	14 feet 6 inches.
Length "	9 " 6 "
Number of furnaces, each	3
Area of grates	538 square feet.
Diameter of boiler tubes	3½ inches.
Length " " "	7 feet.
Area of heating surface	13,000 square feet.
" superheating surface	400 " "

PERFORMANCE.

Steam-pressure, per square inch	75 pounds.
Indicated horse-power (mean of trip)	5,261
Coal per day	98 tons.
Coal per hour per I.P	1.73 pounds.
Speed	14.3 knots.
" at measured mile	16 "
Greatest day's run	383 "

Compound engines can be made much less complicated than plain engines of equal steam-

expanding power. Expansion can readily be carried as far as eight times the original volume without the use of cut-off valves, thus dispensing with a great deal of troublesome machinery. The strains upon the running-gear and crank-shaft are nearly equal throughout the stroke of the piston, and the parts can be made lighter than in the plain engine, where they must be strong enough to withstand the initial pressure of the steam, entailing a consequent increase of friction. Steam cannot be beneficially expanded more than eight times its volume; for even supposing the expansion curve to be an isothermal line, or to follow the imaginary law of Mariotte, a condition that can never be realized in practice, the gain by expanding to sixteen volumes is only four and seven-tenths per cent. more than by expanding eight volumes. To expand eight volumes in the plain engine an extremely complicated apparatus is necessary. See EXPANSION OF STEAM, MARINE STEAM-ENGINE.

When great power is required, it is customary to construct compound engines with three cylinders, one being high pressure and two low pressure, on account of the inconvenient size of the low-pressure cylinder when only one is used. This arrangement also gives a more uniform strain to the crank-shaft.

The ratio of volume between the low-pressure and high-pressure cylinders is usually between three and a half and four to one.

Steam-jacketing and high-pressure steam—two important sources of economy in modern engineering—may be applied to plain engines; but results thus far observed are in favor of the compound engine.—*Albert Aston*, *Chief Engineer U.S.N.*

Compound Screw. Two screws of different pitches acting together on the same axis. In some combinations one screw is within the other, the outer one forming the nut of the inner one, in which case the inner screw does not revolve; or, the two threads may be cut on one continuous piece, one being provided with a fixed nut and the other with a movable nut. Suppose both threads to be either right-handed or left-handed, the resultant motion and consequent force in direction of the axis is represented by the *difference* between the pitches of the screws. The object of this contrivance is to obtain a slow advance due to fine pitch, together with the strength of large threads.

If one screw is right-handed and the other left-handed, the resultant motion is represented by the *sum* of the two pitches. The elevating screws of some classes of ordnance are on this principle. The ordinary "turn-buckle" is another example.—*Albert Aston*, *Chief Engineer U.S.N.*

Comprador (*Sp.*). In the East, one who contracts to furnish meat, vegetables, etc., for a ship.

Compressed-air Engine. An engine similar to the steam-engine, compressed air being the motive force instead of steam. It is especially adapted to locomotive purposes, such as driving street tramway-cars. The air is compressed to any desired tension by large stationary engines, or by water-power, and then heated to a high temperature. It is then received into the reservoirs of the locomotive or street-car, which have sufficient capacity to run to the next station.

Compressor. A curved lever pivoted so as to permit the curve to sweep the lower orifice of the deck-pipe. To the end is hooked a small tackle. When the compressor is hauled to, the chain is jammed between it and the deck-pipe. A mechanism for checking the recoil of a gun.

Comptroller's Office, Second. A bureau of the Treasury Department. Established in 1817. It is the duty of the Comptroller to receive and examine all accounts settled by the Second, Third, and Fourth Auditors, and certify the balances arising thereon to the Secretary of the Department in which the expenditure has been incurred. The Comptroller's jurisdiction is revisory and not original, but in all cases his decision is final and binding upon the Auditor who first passes upon the account or claim. All requisitions of the Secretaries of War and of the Navy on the Treasury for money to be expended by those Departments must be countersigned by the Second Comptroller; and he must report to those Secretaries the official forms to be used in the different offices for disbursing the public money in their respective Departments, and the manner and form of keeping and stating the accounts of the persons employed therein. In case of the death of any petty officer, seaman, or other person not an officer, on board any vessel in the employ of the United States, which has been sunk or destroyed, the Comptroller may prescribe rules to govern the payment of arrears of pay due such person to the persons designated by law to receive the same. The Comptroller is the custodian of the official bonds of all disbursing officers of the War and Navy Departments, and all contracts made by virtue of any law, and requiring the advance of money, or in any manner connected with the settlement of public accounts, if cognizable by the Second Comptroller, must be deposited in his office within ninety days after their respective dates. The Second Comptroller is charged with the preservation of the public accounts subject to his revision, but in all cases such accounts after having been revised are returned to the Auditor from whom they were received, and are placed among his files. The office of the Second Comptroller consists of the Comptroller, Deputy Comptroller, and sixty clerks, and is organized in divisions, as follows: army-pay, navy-pay, quartermaster's, Indian, law and miscellaneous, army pension, and book-keepers.

Concealment, or Suppressio Veri. Consists in the suppression of any fact or circumstance as to the state of the ship, the nature of her employ, and the time of sailing or expected arrival, material to the risk of insurance, and is fatal to the insured. But it is held immaterial to disclose the secret destination of privateers, the usages of trade, or matters equally open to both parties.

Concentrated Fire. See FIRE.

Concentric Engine. An instrument used in scroll engraving, particularly bank-note plate engraving.

Conch. A large univalve, used as a horn by pilots, fishermen, etc., in fogs; a *strombus*, *triton*, or sometimes a *murex*. A name for wreckers of the Bahama reefs; though plunder is their object, the *Conchs* are very serviceable, and evince both courage and address in saving the lives of the wrecked. A nickname for the inhabitants of Key West.

Concluding-line. A small rope hitched to

the middle of the steps of the stern-ladders. Also, a small line leading through the centre of the steps of a Jacob's ladder.

Concussion-fuze. See FUZE.

Condemn. To determine, judicially, the question of title to a captured vessel in favor of the captor. (See PRIZE.) To declare a vessel unseaworthy with a view to her being broken up. To pronounce against the physical capacity of an officer or enlisted man. To declare officially that stores are unfit for use.

Condenser. In the steam-engine, the vessel or apparatus in which the steam is condensed when expelled from the cylinder after having performed its work, and in which a partial vacuum is constantly maintained while the machinery is in operation, the steam being instantly deprived of its latent heat and a portion of its sensible heat, either by direct contact with cold water injected as a "spray," or being exposed to metallic surfaces kept cold by circulating water. When the spray or jet is used, and the water of condensation mixes with the "injection," or refrigerating water, the apparatus is called a "jet condenser"; and when the condensation is produced by contact with metallic surfaces, and the purity of the water of condensation preserved, it is called a "surface condenser." In both cases the uncondensed vapor, the quantity of which depends upon the temperature of the water of condensation, and the air or other gas mixed with the steam, are drawn off by an air-pump.

The surface condenser consists of a box sufficiently strong to resist the atmospheric pressure, usually of cast iron and of rectilinear cross-sections, filled with tubes about ⅝ or ¾ inch diameter, packed water-tight at both ends, the steam being exposed to one surface of the tube, and the refrigerating water, which is generally forced through by a pump, called a circulating-pump, to the other.

The amount of tube-surface exposed to the steam should be about one square foot for each pound of coal consumed per hour. This will insure a good vacuum in any climate. The quantity of refrigerating water may be computed by the formula:

$$W = \frac{w\,(H - T_2)}{T_1 - T_0}$$

in which H denotes the total heat of the steam discharged into the condenser, w its weight, T_0 the temperature of the sea-water, T_1 that of the discharge-water, W its weight, and T_2 the temperature of the water of condensation. From this the volume for any given time may be easily computed. With a jet condenser—

$$T_2 = T_1.$$

The value of T_0 may be generally considered about 80° Fahr. See MARINE STEAM-ENGINE.—*Albert Aston, Chief Engineer U.S.N.*

Condensing Engine. A steam-engine in which the steam, after having performed its work, instead of being expelled into the atmosphere as in a locomotive-engine, is brought in contact with cold water or cold metallic surfaces in an apparatus called a condenser, where it is instantly condensed, thereby producing a partial vacuum and relieving the piston of a greater portion of the atmospheric pressure, and, at the same time, reserving the pure water of condensation for resupplying the boilers. See CONDENSER.

An engine for condensing or compressing matter of any kind.

Conder. A watcher of fishes, the same as balker, huer, and olpis. His employment was to give notice to the fishermen from an eminence which way the shoals of fish were going.

Conductor. A metal rod or wire projecting above the truck and leading thence to the water. Its use is to protect the ship from lightning. See ELECTRICITY.

Cone-buoy. See BUOY.

Cone Valve. A rotating or oscillating valve, the bearing surfaces of which are conical, and which is similar in its action to a cock. The device has never been successfully adopted on a large scale, owing principally to the variable expansion of the metal.

Coney-fish. A name of the burbot.

Confederation, Argentine. The navy of the Confederation consists of 26 steamers, 2 of which are ironclads, and they are manned by 2900 sailors and marines. This navy is commanded by 2 admirals and 74 other officers.

Configuration. Relative position or aspect of the planets; or the face of the horoscope, according to the relative position of the planets at any time.

Confluent. Flowing together; meeting in a common current; as, confluent streams.

Conger. A large species of sea-eel, of the *Anguilla* family (*Conger* of some naturalists). It sometimes attains a length of 10 feet and a weight of 100 pounds.

Congress. An assembly of princes or plenipotentiaries for the settlement of the affairs of peoples or states.

Congress of the United States. The national legislature. For its constitution, powers, and relation to the navy, see CONSTITUTION OF THE UNITED STATES.

Congreve-rocket. A powerful rocket invented by Sir William Congreve.

Conical Valve. A valve with a conical bearing surface. The valve may either lift in direction of the axis of the cone or rotate about it.

Conic Sections. That part of mathematics which treats of the measurements, properties, etc., of the sections of a cone. The curves formed by the cutting of a cone by a plane are the *parabola* (Gr. *paraballein*, to place side by side), the *ellipse* (Gr. *elleipein*, to fall short of), and the *hyperbola* (Gr. *huperballein*, to exceed). When the cutting plane is parallel with the generating line of the cone a parabola is formed; when the inclination of the cutting plane to the base is less than that of the generating line, an ellipse is formed; and when it is greater, we have a hyperbola.

Conjee. Gruel made of rice.

Conjunction. Heavenly bodies are in conjunction when they have the same longitude. The *inferior* conjunction of a planet is its position when in conjunction on the side of the sun nearest the earth; its *superior* conjunction is its position when in conjunction on the side of the sun farthest from the earth. The superior planets have no inferior conjunction.

Conn, Con, or Cun. This word is derived from the Anglo-Saxon *conne*, *connan*, to know,

to be skillful. To direct the course of a ship. The quartermaster conns the ship ordinarily, but on special occasions it is done by the pilot, officer of the deck, navigator, or commanding officer. *At the conn*, at the station for conning the ship.

CONNINGS. Reckonings.

Connaissance des Temps. The French work corresponding to the "Nautical Almanac."

Connecting Rod. A rod connecting the reciprocating parts of a machine with the rotating parts, such as the cross-head or beam with the crank of a steam-engine. The ends of the rod are provided with adjustable bearings fitted to the journals of the cross-head, or beam-centre, and crank-pin. When the length of the rod is great in comparison to its diameter, it is braced by light rods stretched over "struts" or "outriggers."

Consign. To commit goods to a shipmaster for conveyance and delivery to the person to whom they are addressed.

CONSIGNEE. The person to whom goods are sent.

CONSIGNOR. The person who sends goods.

Console-bracket. A bracket or ornament used to support any projections on the outside or inside of the ship.

Consort. Any vessel in company with another.

Constant Battery. See GALVANIC BATTERY.

Constantinople. A celebrated city of Turkey in Europe, and the capital of the Ottoman Empire, in lat. 41° 0′ 18″ N., lon. 28° 59′ 15″ E., situated on a declivity or series of gentle hills at the eastern extremity of a triangular promontory of the province of Roumelia, having the Sea of Marmora and the Bosphorus on the south and east, and the Golden Horn, an inlet of the latter, on the north. It is thus surrounded by water on all sides except the west, and has a sea front altogether of about 8 miles in extent. The city proper comprises several quarters, as those for the Jews, Armenians, and Greeks. The Greek quarter, the "Fanar," extends along the shore of the port, or the Golden Horn. This fine harbor lies between the city and its suburbs Pera and Galata, extending for about 4½ miles inland in a northwesterly direction, and varying in breadth from 1 to 4 furlongs. It is deep enough to float ships of the largest size, and is crossed by two bridges of boats, which unite the Fanar with the northern suburbs. Pop. 700,000.

Constellation (Lat. *con*, together; *stellatio*, a grouping of stars, from *stella*, a star). A group of fixed stars to which a name has been given. These names have mostly their origin in the mythology of the Greeks, derived and modified from the Egyptians and the East; and the stars forming each configuration are ranged and named in order of brilliancy. The districts thus mapped out are entirely arbitrary, and in general correspond to no natural grouping of the stars. "Innumerable snakes twine through long and contorted areas of the heavens where no memory can follow them; bears, lions, and fishes, large and small, northern and southern, confuse all nomenclature." The ancient system has, however, obtained a currency from which it would be difficult to dislodge it; and it serves the purpose of briefly naming remarkable stars,—an important point for the navigator. The following is a list of the principal constellations, with the right ascension and declination of the brightest star in each:

Name.	R. A.	Dec.
	h. m.	° ′
Andromeda, Andromeda	0 2.2	28 26 N.
Antlia, The Air-Pump	10 21.7	30 27 S.
Apus, The Bird of Paradise	14 33	78 32 S.
Aquarius, The Water-Bearer	21 59.6	0 54 S.
Aquila, The Eagle	19 43.9	8 33 N.
Ara, The Altar	17 22.6	49 47 S.
Argo, The Ship Argo	6 21.3	52 38 S.
Aries, The Ram	2 0.4	22 55 N.
Auriga, The Wagoner	5 7.8	45 52 N.
Boötes, The Herdsman	14 10.2	19 49 N.
Cælum, The Sculptor's Tools	4 36.7	42 6 S.
Cameleopardalis, The Giraffe	4 42.1	66 8 N.
Cancer, The Crab	8 51.9	12 19 N.
Canes Venatici, The Hunting Dogs	12 50.4	38 58 N.
Canis Major, The Greater Dog	6 39.9	16 33 S.
Canis Minor, The Lesser Dog	7 33	5 32 N.
Capricornus, The Sea-Goat	20 11.4	12 55 S.
Cassiopeia, Cassiopeia	0 33.7	55 53 N.
Centaurus, The Centaur	14 31.5	60 20 S.
Cepheus, Cepheus	21 15.7	62 5 N.
Cetus, The Sea-Monster	2 56	3 37 N.
Chamæleon, The Chameleon	8 21.6	76 32 S.
Circinus, The Compass	14 32.8	64 27 S.
Columba, Noah's Dove	5 35.3	34. 8 S.
Coma Berenices, Berenice's Hair	13 4.2	18 10 N.
Corona Australis, The Southern Crown	19 1.3	38 5 S.
Corona Borealis, The Northern Crown	15 29.6	27 7 N.
Corvus, The Crow	12 2.2	24 3 S.
Crater, The Cup	10 53.9	17 40 S.
Crux, The Cross	12 19 9	62 26 S.
Cygnus, The Swan	20 37.3	44 51 N.
Delphinus, The Dolphin	20 34.1	15 29 N.
Dorado, The Sword-Fish	4 31.3	55 18 S.
Draco, The Dragon	14 1.1	64 57 N.
Equuleus, The Little Horse	21 9.8	4 45 N.
Eridanus, The River Eridanus	1 33.3	57 51 S.
Fornax, The Furnace	2 44.1	32 55 S.
Gemini, The Twins	7 27	32 9 N.
Grus, The Crane	22 0.6	47 33 S.
Hercules, Hercules	17 9.2	14 32 N.
Horologium, The Clock	4 10	42 35 S.
Hydra, The Sea-Serpent	9 21.7	8 8 S.
Hydrus, The Water-Snake	1 55	62 9 S.
Indus, The Indian	20 29.1	47 43 N.
Lacerta, The Lizard	22 26.4	49 40 S.
Leo, The Lion	10 2	12 33 N.
Leo Minor, The Lesser Lion	10 21	37 19 N.
Lepus, The Hare	5 27.4	17 55 S.
Libra, The Balance	14 44.2	15 32 S.
Lupus, The Wolf	14 34	46 52 S.
Lynx, The Lynx	9 13 8	34 54 N.
Lyra, The Lyre	18 32.9	38 40 N.
Mensa, The Table Mountain	4 59.2	75 8 S.
Microscopium, The Microscope	20 42.5	34 14 S.
Monoceros, The Unicorn	7 35.6	9 16 S.
Musca, The Bee	12 30	68 28 S.
Norma, The Rule	16 10.9	49 52 S.
Octans, The Octant	20 50.2	77 29 S.
Ophiuchus, The Serpent-Bearer	17 29.4	12 39 N.
Orion, Orion	5 48.7	7 24 N.
Pavo, The Peacock	20 16.2	57 7 S.
Pegasus, The Winged Horse	22 58.8	14 34 N.
Perseus, Perseus	3 15.8	49 26 N.
Phœnix, The Phœnix	0 20.4	42 58 S.
Pictor, The Painter's Easel	6 47	61 49 S.
Pisces, The Fishes	1 55.9	2 11 N.
Piscis Australis, The Southern Fish	22 51	30 16 S.
Piscis Volans, The Flying-Fish	9 0.6	65 55 S.
Reticulum, The Net	4 12.9	62 47 S.
Sagitta, The Arrow	19 34.7	17 44 N.
Sagittarius, The Archer	18 16.2	34 26 S.
Scorpio, The Scorpion	16 22.1	26 10 S.
Sculptor, The Sculptor's Workshop	0 52 8	30 0 S.
Serpens, The Serpent	15 38.4	6 48 N.
Sextans, The Sextant	10 1.8	0 13 N.
Taurus, The Bull	4 29	16 16 N.
Telescopium, The Telescope	18 18.1	46 2 S.
Toucan, The Toucan	22 10.3	60 51 S.
Triangula, The Northern Triangles	1 46.3	29 0 N.
Triangulum Australe, The Southern Triangle	16 36	68 48 S.
Ursa Major, The Greater Bear	10 56.3	62 24 N.
Ursa Minor, The Lesser Bear	1 14.6	88 40 N.
Virgo, The Virgin	13 18.9	10 32 S.
Volans. See Piscis Volans.		
Vulpecula, The Fox	19 23.7	24 25 N.

Constitution (Lat. *con*, together, and *statuo*, to place). The collective body of the fundamental laws of a state, whether expressed in

written documents or established by prescriptive usage. In a certain sense, all states in which the power of a sovereign over his people, or classes of his people, is limited by law or legal usage in any particular, may be said to possess, to that extent, a constitution; but in ordinary language only a government in which the power of legislation, or that of granting and withholding supplies to the sovereign, is vested in the people or a body of representatives elected by them, or by a class of them, is termed constitutional.

Constitution of the United States of America, with Amendments. We the people of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this CONSTITUTION for the United States of America.

ART. 1.—*Sect.* 1. All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Sect. 2. The House of Representatives shall be composed of Members chosen every second Year by the people of the several States, and the Electors in each State shall have the Qualifications requisite for Electors of the most numerous Branch of the State Legislature.

No Person shall be a Representative who shall not have attained to the Age of twenty-five Years, and been seven Years a Citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three-fifths of all other Persons. The actual Enumeration shall be made within three Years after the first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct. The Number of Representatives shall not exceed one for every thirty Thousand, but each State shall have at Least one Representative; and until such enumeration shall be made, the State of New Hampshire shall be entitled to chuse three, Massachusetts eight, Rhode-Island and Providence Plantations one, Connecticut five, New-York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such vacancies.

The House of Representatives shall chuse their Speaker and other Officers; and shall have the sole Power of Impeachment.

Sect. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote.

Immediately after they shall be assembled in Consequence of the first Election, they shall be divided as equally as may be into three Classes. The Seats of the Senators of the first Class shall be vacated at the Expiration of the second Year, of the second Class at the Expiration of the fourth Year, and of the third Class at the expiration of the sixth Year, so that one-third may be chosen every second Year; and if Vacancies happen by Resignation, or otherwise, during the Recess of the Legislature of any State, the Executive thereof may make temporary Appointments until the next Meeting of the Legislature, which shall then fill such Vacancies.

No person shall be a Senator who shall not have attained to the Age of thirty Years, and been nine Years, a Citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

The Vice President of the United States shall be President of the Senate, but shall have no Vote, unless they be equally divided.

The Senate shall chuse their other Officers, and also a President pro tempore, in the Absence of the Vice President, or when he shall exercise the Office of President of the United States.

The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation. When the President of the United States is tried, the Chief Justice shall preside: And no Person shall be convicted without the Concurrence of two-thirds of the Members present.

Judgment in Cases of Impeachment shall not extend further than to removal from Office, and disqualification to hold and enjoy any Office of honor, Trust or Profit under the United States: but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Law.

Sect. 4. The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereof, but the Congress may at any time by Law make or alter such Regulations, except as to the Places of chusing Senators.

The Congress shall assemble at least once in every Year, and such Meeting shall be on the first Monday in December, unless they shall by Law appoint a different Day.

Sect. 5. Each House shall be the Judge of the Elections, Returns and Qualifications of its own Members, and a Majority of each shall constitute a Quorum to do Business; but a smaller Number may adjourn from day to day, and may be authorized to compel the Attendance of absent Members, in such Manner, and under such Penalties as each House may provide.

Each House may determine the Rules of its Proceedings, punish its Members for disorderly Behaviour, and, with the Concurrence of two-thirds, expel a Member.

Each House shall keep a Journal of its Proceedings, and from time to time publish the same, excepting such Parts as may in their Judgment require Secrecy; and the Yeas and Nays of the Members of either House on any question shall, at the Desire of one fifth of those Present, be entered on the Journal.

Neither House, during the Session of Congress, shall, without the Consent of the other, adjourn for more than three days, nor to any other Place than that in which the two Houses shall be sitting.

Sect. 6. The Senators and Representatives shall

receive a Compensation for their services, to be ascertained by Law, and paid out of the Treasury of the United States. They shall, in all Cases, except Treason, Felony and Breach of the Peace, be Privileged from Arrest during their Attendance at the Session of their respective Houses, and in going to and returning from the same; and for any Speech or Debate in either House, they shall not be questioned in any other Place.

No Senator or Representative shall, during the Time for which he was elected, be appointed to any civil Office under the Authority of the United States, which shall have been created, or the Emoluments whereof shall have been encreased during such time; and no Person holding any Office under the United States, shall be a Member of either House during his Continuance in office.

Sect. 7. All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as on other Bills.

Every Bill which shall have passed the House of Representatives and the Senate, shall, before it become a Law, be presented to the President of the United States; If he approve he shall sign it, but if not he shall return it, with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House, by which it shall likewise be reconsidered, and if approved by two thirds of that House, it shall become a Law. But in all such Cases the Votes of both Houses shall be determined by yeas and Nays, and the Names of the Persons voting for and against the Bill shall be entered on the Journal of each House respectively. If any bill shall not be returned by the President within ten Days (Sundays excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law.

Every Order, Resolution, or Vote to which the Concurrence of the Senate and House of Representatives may be necessary (except on a question of Adjournment) shall be presented to the President of the United States; and before the Same shall take Effect, shall be approved by him, or being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the Rules and Limitations prescribed in the Case of a Bill.

Sect. 8. The Congress shall have Power To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all duties, Imposts and Excises shall be uniform throughout the United States;

To borrow Money on the credit of the United States;

To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

To establish an uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;

To provide for the Punishment of counterfeiting the Securities and current Coin of the United States;

To establish Post Offices and post Roads;

To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

To constitute Tribunals inferior to the supreme Court;

To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captures on Land and Water;

To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

To provide and maintain a Navy;

To make Rules for the Government and Regulation of the land and naval Forces;

To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;

To provide for organizing, arming, and disciplining, the Militia, and for governing such Part of them as may be employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress;

To exercise exclusive Legislation in all Cases whatsoever, over such District (not exceeding ten Miles square) as may, by Cession of particular States, and the Acceptance of Congress, become the Seat of the Government of the United States, and to exercise like Authority over all Places purchased by the Consent of the Legislature of the State in which the Same shall be, for the Erection of Forts, Magazines, Arsenals, dock-Yards, and other needful Buildings;—And

To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.

Sect. 9. The Migration or Importation of such Persons as any of the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight, but a Tax or duty may be imposed on such Importation, not exceeding ten dollars for each Person.

The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the Public Safety may require it.

No Bill of Attainder or ex post facto Law shall be passed.

No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken.

No Tax or Duty shall be laid on Articles exported from any State.

No Preference shall be given by any Regulation of Commerce or Revenue to the Ports of

one State over those of another; nor shall Vessels bound to, or from, one State, be obliged to enter, clear, or pay Duties in another.

No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time.

No Title of Nobility shall be granted by the United States; And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince, or foreign State.

Sect. 10. No State shall enter into any Treaty, Alliance, or Confederation; grant Letters of Marque and Reprisal; coin Money; emit Bills of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts; pass any Bill of Attainder, ex post facto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility.

No State shall, without the Consent of the Congress, lay any Imposts or Duties on Imports or Exports, except what may be absolutely necessary for executing its inspection Laws; and the net Produce of all Duties and Imposts, laid by any State on Imports or Exports, shall be for the Use of the Treasury of the United States; and all such Laws shall be subject to the Revision and Controul of the Congress.

No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War, unless actually invaded, or in such imminent Danger as will not admit of delay.

ART. II.—*Sect.* 1. The executive Power shall be vested in a President of the United States of America. He shall hold his Office during the Term of four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows.

Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress: but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.

The Electors shall meet in their respective States, and vote by Ballot for two Persons, of whom one at least shall not be an Inhabitant of the same State with themselves. And they shall make a List of all the Persons voted for, and of the Number of Votes for each; which List they shall sign and certify, and transmit sealed to the Seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the Presence of the Senate and House of Representatives, open all the Certificates, and the Votes shall then be counted. The Person having the greatest Number of Votes shall be the President, if such Number be a Majority of the whole Number of Electors appointed; and if there be more than one who have such Majority, and have an equal Number of Votes, then the House of Representatives shall immediately chuse by Ballot one of them for President; and if no Person have a Majority, then from the five highest on the List the said House shall in like Manner chuse the President. But in chusing the President, the Votes shall be taken by States, the Representation from each State having one Vote; A quorum for this Purpose shall consist of a Member or Members from two thirds of the States, and a Majority of all the States shall be necessary to a Choice. In every Case, after the Choice of the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But if there should remain two or more who have equal Votes, the Senate shall chuse from them by Ballot the Vice President.

The Congress may determine the Time of chusing the Electors, and the Day on which they shall give their Votes; which Day shall be the same throughout the United States.

No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any person be eligible to that Office who shall not have attained the Age of thirty five Years, and been fourteen Years a Resident within the United States.

In Case of the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the Same shall devolve on the Vice President, and the Congress may by Law provide for the Case of Removal, Death, Resignation or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be encreased nor diminished during the Period for which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any of them.

Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation: —"I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States."

Sect. 2. The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any Subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment.

He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur; and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided

for, and which shall be established by Law; but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the President alone, in the Courts of Law, or in the Heads of Departments.

The President shall have power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

Sect. 3. He shall from time to time give to the Congress Information of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the Time of Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers; he shall take Care that the Laws be faithfully executed, and shall Commission all the Officers of the United States.

Sect. 4. The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

ART. III.—*Sect.* 1. The judicial Power of the United States, shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behaviour, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

Sect. 2. The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their authority;—to all Cases affecting Ambassadors, other public Ministers and Consuls;—to all Cases of admiralty and maritime Jurisdiction;—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and Citizens of another State;—between Citizens of different States,—between Citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects.

In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be a Party, the supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed; but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

Sect. 3. Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court.

The Congress shall have Power to declare the Punishment of Treason, but no Attainder of Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attainted.

ART. IV.—*Sect.* 1. Full Faith and Credit shall be given in each State to the public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof.

Sect. 2. The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States.

A Person charged in any State with Treason, Felony, or other Crime, who shall flee from Justice, and be found in another State, shall on Demand of the executive Authority of the State from which he fled, be delivered up, to be removed to the State having Jurisdiction of the Crime.

No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the party to whom such Service or Labour may be due.

Sect. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the Jurisdiction of any other State; nor any State be formed by the Junction of two or more States, or Parts of States, without the Consent of the Legislatures of the States concerned as well as of the Congress.

The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States; and nothing in this Constitution shall be so construed as to Prejudice any Claims of the United States, or of any particular State.

Sect. 4. The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened) against domestic Violence.

ART. V.—The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress; Provided that no Amendment which may be made prior to the Year One thousand eight hundred and eight shall in any Manner affect the first and fourth Clauses in the Ninth Section of the first Article; and that no State, without its Consent, shall be deprived of its equal Suffrage in the Senate.

ART. VI.—All Debts contracted and Engage-

ments entered into, before the Adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation.

This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the Land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

Art. VII.—The Ratification of the Conventions of nine States, shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same.

AMENDMENTS.

Art. I.—Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

Art. II.—A well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms shall not be infringed.

Art. III.—No Soldier shall, in time of peace, be quartered in any house, without the consent of the Owner, nor in time of war, but in a manner to be prescribed by law.

Art. IV.—The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

Art. V.—No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the Militia, when in actual service in time of War or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any Criminal Case to be a witness against himself, nor to be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

Art. VI.—In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining Witnesses in his favor, and to have the Assistance of Counsel for his defence.

Art. VII.—In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any Court of the United States, than according to the rules of the common law.

Art. VIII.—Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

Art. IX.—The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

Art. X.—The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

Art. XI.—The Judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by Citizens of another State, or by Citizens or Subjects of any Foreign State.

Art. XII.—The Electors shall meet in their respective States, and vote by ballot for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same State with themselves, they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President, and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate;—The President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted;—The person having the greatest number of votes for President, shall be the President, if such number be a majority of the whole number of Electors appointed; and if no person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President, shall be the Vice-President, if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list, the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitution-

ally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

Art. XIII.—*Sect.* 1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

Sect. 2. Congress shall have power to enforce this article by appropriate legislation.

Art. XIV.—*Sect.* 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.

Sect. 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice President of the United States, Representatives in Congress, the Executive and Judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion, or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

Sect. 3. No person shall be a Senator or Representative in Congress, or elector of President and Vice President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may by a vote of two-thirds of each House, remove such disability.

Sect. 4. The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations and claims shall be held illegal and void.

Sect. 5. The Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

Art. XV.—*Sect.* 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

Sect. 2. The Congress shall have power to enforce this article by appropriate legislation.

Construction and Repair, Bureau of. The bureau of the Navy Department which has charge of dry-docks, of all vessels undergoing repairs, and of the designing, building, and fitting out of vessels. The head of the bureau is the chief constructor of the navy and ranks with a commodore.

Consuls. Commercial agents appointed to reside in the seaports of foreign countries with a commission to watch over the commercial rights and privileges of the nation deputing them. Such officers appear to have been first employed by the Italian republics to protect their merchants engaged in trade in the cities of the Levant. They have been multiplied and extended to every part of the world where navigation and commerce can successfully penetrate, and their duties and privileges are now generally limited and defined in treaties of commerce, or by the statute regulations of the country which they represent. The laws of the United States respecting consuls authorize them to receive the protests of masters and others relating to American commerce, and they declare that consular certificates under seal shall receive faith and credit in the courts of the United States. It is made their duty, where the laws of the country permit, to administer on the personal estates of American citizens dying within their consulates and leaving no legal representative, and to take charge of and secure the effects of stranded American vessels, in the absence of the master, owner, or consignee; and they are bound to provide for destitute seamen within their consulates, and to send them at the public expense to the United States. It is also made their duty to reclaim deserters, to discountenance insubordination and to lend their aid to the local authorities for that purpose, and to discharge seamen cruelly treated. No representative or diplomatic character attaches to consuls except by treaty, nor can they be invested with judicial powers except with the consent of the government of the country in which they reside.

Consular Agents. Subordinates of consuls, who exercise their powers at ports or places different from those at which their principals are located.

Consul-general. A consul having jurisdiction in several places, or over several consuls.

Deputy-consuls. Subordinates of consuls, who exercise their powers and perform their duties at the same ports or places in which their principals are located. See Commercial Agent.

Vice-Consuls. Consular officers temporarily holding the place of consuls during the absence of the latter, or when they have been relieved. The vice-consul has no powers or functions when the consul is present at his post.

Consus. A title of Neptune.

Contact. A touching or meeting of bodies.

Contents. A document which the master of a merchantman must deliver to the custom-house searcher before he can clear outwards; it describes the vessel's destination, cargo, and all necessary particulars.

Continental System. In modern history, the celebrated plan of the Emperor Napoleon for excluding the merchandise of England from all

parts of the continent of Europe. It was commenced by the decree of Berlin, issued November 21, 1806, which declared the British islands in a state of blockade, and made prisoners of war all Englishmen found in the territories occupied by France and her allies. The blockade thus instituted was far from complete; and in the course of events licenses were expressly granted by the government for its evasion, and became a source of revenue. Some writers have affirmed that British commerce lost by this decree and those which followed it more than sixty millions sterling in eighteen months, but this is an enormous exaggeration.

Continents. Continents are the natural grand divisions of the earth's surface. There are six continents; viz., Asia, Africa, Europe, North America, South America, and Australia. To these may be added, provisionally, the Antarctic Continent, lying about the south pole.

1. Asia is the largest, and was the first civilized portion of the globe. It extends from Singapore, in lat. 1° 17′ N., to Cape Severo, in 78° N., and from East Cape, in lon. 169° W., to Cape Baba, in 26° E. lon., covering an area of 17,500,000 square miles. It is nearly square, with many outlying peninsulas. Its shores are washed by 3 oceans, and it has numerous gulfs, bays, and seas, there being no less than 13 large seas washing its shores. Many islands also line its coast. Its mountains are the highest in the world, the Himalaya, Hindoo Koosh, Thian-Shan, and Yablonoi ranges being the principal ones. Its many rivers are large, the Obi, Yenisei, Lena, Amoor, Hoang-Ho, Yang-tse-Kiang, Cambodia, Irrawaddy, Burramapootra, Ganges, Indus, Tigris, and Euphrates being chief among them. The northern part consists of extensive plateaus, sloping to the Arctic, the central of elevated table-lands, surrounded by high mountain chains, and the eastern and southern portions of alluvial plains.

The great desert of Gobi extends through the centre, and much of Arabia is also desert land. The predominating races that inhabit Asia are of the Caucasian and Mongolian families. There are 780,500,000 people, or about 44 to the square mile. China, Russia, Persia, Turkey, and Great Britain are the predominating powers. The entire coast of Asia has been explored, but much of the interior is yet unknown.

2. Africa is a vast peninsula, connected to Asia by the Isthmus of Suez, and separated from Europe by the Mediterranean and the Straits of Gibraltar. Its northern cape is Blanco, in lat. 37° 21′ N., its southerly, Agulhas Cape, in 34° 53′ S.; its easterly point, Cape Guardafui, in 51° 30′ E., and its westerly, Cape Verde, in 17° 33′ W. lon. It contains some 12,000,000 square miles, inhabited by 80,000,000 people, or about 7 to the mile. It is a solid mass, with an uninterrupted coast-line, there being few indentations and no peninsulas. The Mediterranean, the Red Sea, Indian Ocean, and Atlantic wash its coasts. Long an unknown land, it is the field of modern exploration, and is becoming better known. Its uniform coast-line corresponds with its uniformity of surface. The southern table-land, from 3000 to 4000 feet high, is separated from the coast by ranges of mountains. From 15° S. to 15° N. is a vast table-land with a depressed lake region, and north of 15° is the great Sahara Desert, only varied by the fertile lands near the coast and the alluvial plain of Egypt. The principal rivers are the Nile, Zambesi, Orange, Congo, Niger, and Senegal. The chief mountain ranges are the Atlas, the Kong, Drachenberg, and the Samen ranges. Many large lakes exist, the Victoria and Albert Nyanza, Ngami, and Tchad being the largest. The inhabitants belong to 7 races, negroes predominating. The most powerful rulers are the Sultans of Morocco, Tunis, and Zanzibar, the king of Abyssinia, pacha of Egypt, and Great Britain and France in their colonies of Cape Colony and Algiers.

3. Europe is the most populous, but, next to Australia, the least continent of the globe. It extends from Cape Tarifa, lat. 36° N., to Nordkyn, in 71° N. lat., and from Cape Da Roca, 9° 30′ W. lon., to 66° E. lon., containing 3,767,222 square miles, inhabited by 280,000,000 people, or 75 to the mile. These are of the Caucasian race, and are far in advance of others in progress and civilization.

Europe is penetrated by many seas and gulfs, and has many outlying peninsulas, giving her an extended coast-line. Many large and important islands lie near the coasts, Great Britain chief among them. By far the greater part of the country, including Russia, North Germany, Belgium, and Holland, is a fertile plain sloping to the ocean. The principal mountain ranges are the Alps, Pyrenees, Caucasus, Ural, and Scandinavian Mountains. There are no deserts, but the arid steppes of Russia and the puztas of Hungary approach them in character. The Volga, Danube, Dnieper, Don, Rhine, Elbe, Vistula, Loire, Rhone, Tagus, and Po are the principal rivers, and there are numerous large lakes.

4. North America extends from Point Barrow, in lat. 72° N., to Cape Mariato, in lat. 8° 30′ N., and from York Point, lon. 56° W., to Cape Prince of Wales, 156° W. lon., containing 7,400,000 square miles, with a population of 74,000,000, or 10 to a mile. Three oceans wash the coasts, and numerous large seas, gulfs, and bays indent them. All the natural features are on a large scale. The rivers are the largest in the world. The chief ones are the Yukon, Mackenzie, St. Lawrence, Mississippi and its tributaries, Rio Grande del Norte, Colorado, and Columbia. More lakes, and larger ones, are found in North America than in any other country. The chief ones are those of the great St. Lawrence basin, but the country north of this contains great numbers of very large ones. The great mountain chains are the Rocky Mountains in the west and the Alleghanies in the east. There are many volcanoes. A great part of the country consists of fertile plains, well watered and fruitful. North America is divided between the United States, Great Britain, Denmark, Mexico, and the Central American States.

5. South America extends from the southern limit of North America, to which it is connected by the Isthmus of Panama, to Cape Froward, 54° S., and from lon. 35° W. to 83° W., containing 6,500,000 square miles. It much resembles Africa in being a solid mass, with few indenting bays and outlying islands. It possesses many large rivers, the Amazon, La Plata, Para, San Francisco, Orinoco, Negro, and Magdalena being the principal ones. It has a high range of mountains, the Andes traversing it from

north to south, leaving a narrow coast on the west side, and other ranges near the coast of Brazil. The interior consists of vast well-watered plains, called pampas and llanos. Much of it has not been explored. The continent is sparsely inhabited by 30,000,000, or 5 to a mile, of Indians and Europeans, with half-breeds.

6. Australia, the smallest continent, extends from Cape York, 10° 39′ S., to Wilson's promontory, 39° 12′ S., and from Cape Byron, lon. 113° 5′ E., to Steep Point, 153° 16′ E., containing some 3,000,000 square miles, inhabited by 1,336,000 people, natives of the peculiar Papuan race, and European settlers. It belongs to Great Britain. The largest river is the Murray. A range or two of mountains exist, but most of the elevations are detached. Few lakes exist, and they are of a peculiar nature, very shallow, and disappearing quickly in warm seasons. Much of the interior is unexplored. A few large cities are built on the continent, mostly in the southern part.

7. Antarctic Continent. A name given to the tracts of land seen about the South Pole, named Adelie, Enderby, Ballemny, Sabrina, Victoria, Louis Philippe, Graham, and Wilkes Lands. First seen by Wilkes in 1842; its highest latitude yet found was 78° S., by Sir James Ross,—a high mountainous land, fringed by ice.—*F. S. Bassett, Lieutenant U.S.N.*

Contingent. The quota of armed men, or pecuniary subsidy which one nation gives to another in pursuance of an agreement.

Continuous-service Certificate. All men who enlist for three years, except officers' cooks, stewards, and servants, will receive, upon the expiration of their enlistments, if they shall so elect, continuous-service certificates in lieu of the ordinary or honorable discharges.

All persons holding continuous-service certificates will be entitled to receive for each continuous re-enlistment for three years, within three months from the date of their discharge, one dollar per month in addition to the pay prescribed for their several ratings; but a person failing to re-enlist within three months from the date of his discharge will cease to derive any advantage from his previous continuous enlistments.

The continuous-service certificate will embrace all the advantages of an honorable discharge in cases where persons are recommended for the same, and must always show, in the column for the purpose, whether or not the person is entitled to an honorable discharge.

Cont-line. The space between the bilges of two casks stowed side by side. The space between the strands of a rope; when a rope is served this space is filled up with the worming so that the service will be smooth.

Contraband (It. *contra*, against; *bando*, an edict or proclamation). In commercial language, goods exported from or imported into a country against its laws.

Contraband of War. Such articles as a belligerent has by the law of nations the right of preventing a neutral from furnishing to his enemy. See International Law.

Contract. Supplies for the navy are, as far as practicable, purchased by contract. The Secretary of the Navy is forbidden by law to make any contract except under a law authorizing the same, or under an appropriation adequate to its fulfillment, and excepting also contracts for subsistence and clothing. All persons employed in the navy are prohibited from having any interest whatever in purchases or contracts for supplies for the navy, and from receiving, directly or indirectly, any emolument or gratuity from any contractor or other person furnishing supplies, and from acting as agent or attorney for any such persons. No action will lie against an officer upon contracts made by him in his official capacity for public purposes, and within the legitimate scope of his duties.

Contract of Affreightment. See Charter-party.

Contribution. A tax levied upon a conquered country in lieu of confiscation of property, and as some indemnity for the expenses of maintaining order and affording protection. General average (which see). The ratable proportion which each of several underwriters pays when more than one insurance has been effected on the same risk.

Controller. A cast-iron block with depressions on the upper surface which fit the links of the cable and prevent its running out. It can be thrown out of gear by means of a short lever.

Convict-ship. A ship appropriated to the use of convicts, or one chartered to convey convicts to their destination.

Convoy. A merchant vessel or fleet of merchant vessels protected by an armed force. The ship or ships which conduct and defend merchant vessels while proceeding to their destination.

Convoy-instructions. The written or printed regulations supplied by the senior officer to each ship of the convoy.

Convoy-list. A register of the ships composing the convoy.

Conyngham, Gustavus, Captain. A native of Ireland, emigrated to the United Colonies about the year 1767; became an apprentice to Capt. Henderson, then in the Antigua trade, and continued with him as sailor and mate until, by Capt. Henderson's death, he was promoted to the command of the vessel in which he had been serving, the "Molly." Capt. Conyngham continued in the same trade until the commencement of our Revolutionary war, when he went to Europe with Mr. Jonathan Nesbit, who obtained for him a commission for a privateer from Dr. Franklin and Silas Deane. Having received his commission he proceeded to Dunkirk, where a vessel was purchased and fitted out for a cruise in the British Channel. This was one of the first privateers that appeared in those seas under our flag. She was so successful in capturing British vessels that the name of Conyngham became a terror in the Channel. He generally burnt or destroyed his prize-vessels. In 1778 he was captured, and treated with such severity that Congress, by resolution (July 17, 1779), directed their Secretary to write in their name to the admiral or commanding officer of the British fleet lying in the harbor of New York to demand the reasons of his being treated "in a manner contrary to the dictates of humanity and the practice of Christian civilized nations;" and they directed, in the event of a satisfactory answer not being given, that the Marine Committee should "immediately cause to be confined, in close and safe custody, such

and so many persons as they may think proper, in order to abide the fate of the said Gustavus Conyngham." On the 13th of December following Congress refused to allow Christopher Hele, then a prisoner, to be exchanged or to go upon his parole, declaring, by resolution, that he must abide the fate of Capt. Conyngham. After Capt. Conyngham was captured a print was exhibited in London as his exact likeness, and thousands flocked to see it. This print represented him as a man of gigantic stature, with shoulders of extraordinary breadth, and his whole person indicating great strength, with a countenance ferocious in the extreme, holding in his right hand a drawn sword at least six feet in length. Underneath the print was painted in large letters, "The Arch Rebel." Admirable likeness! Conyngham was short, very slender, and his visage remarkably thin, but he was very active and full of spirit. His health suffered greatly during his confinement, of which he complained until his death.

Cook, James, Captain. One of the most scientific and adventurous officers in the British navy. Deputed to the South Pacific, in 1768, to observe the transit of Venus, he seized the opportunity of exploring the coast of New South Wales. Four years later he was sent to find a land supposed to exist in high southern latitudes; but he did not discover any territory as high as 70° S. lat. He, however, came on an island which stands on the charts as New Caledonia. In 1776, Cook explored Behring's Strait, and in the following year, sailing into the Pacific, he discovered the Sandwich Islands. At Hawaii he was set upon by the savages and killed.

Cook. To concoct or prepare; hence to tamper with or alter; as, to cook a sight, that is, to so change the data as to make the final result coincide with the observer's wishes.

Cook, Mess. A man detailed from each mess whose duty is to draw from the paymaster the food to which his mess is entitled, to prepare it for cooking and deliver it to the ship's cook, to receive it from the galley when it is cooked, and to attend to the cleaning and arranging of the mess-gear. He is generally selected from the landsmen of the mess, and ordinarily receives from the members of his mess a compensation equal to the value of one ration.

Cook, Officer's. The cook to the commander-in-chief, cabin cook, wardroom cook, steerage cook, and warrant-officer's cook do the cooking for their respective messes. They are not entitled to continuous-service certificates, nor to the benefit of an honorable discharge.

Cook, Ship's. A petty officer who has charge of the galley and superintends the cooking for the whole ship's crew. He brings a sample of the dinner for the day to the mast at seven bells, where it is inspected by the officer of the deck. In early days the position of ship's cook was a lucrative one; he was entitled to a share of the slush-money, and received an allowance for extra cooking; as, scouse, early coffee, etc. At present the early coffee is authorized by the government, and the slush-money is devoted to the ship's use.

Cook-house. The caboose containing the cooking apparatus.

Coom. The crest or comb of a wave. See Comb.

Cooming. See Coaming.

Cooper, George H., Commodore U.S.N. Born in New York. Appointed from New York, August 14, 1837; attached to fleet operating on coast of Florida, 1837, and was constantly employed co-operating with the army in boat expeditions against the Seminole Indians; frigate "Constitution," Pacific Squadron, 1838–42; Naval School, Philadelphia, 1843.

Promoted to passed midshipman, June 23, 1843; schooner "Flirt," Home Squadron, 1846–47.

The "Flirt" reported for duty to Gen. Zachary Taylor in March, 1846. Passed Midshipman Cooper commanded a detachment of men at Point Isabel, Texas, under Major Monroe, of the U. S. army, previous to and after the battles of May 8 and 9. After the capture of Monterey, was transferred to Commodore Connor's squadron, and was in both attacks on Tabasco, and attacks on Alvarado and Tuspan. Served in the squadron until the reduction of the capital. Receiving-ship, Norfolk, 1847–48; naval station, Norfolk, 1849–50; steam-frigate "Susquehanna," East India Squadron, 1850–55.

Commissioned as lieutenant, May 8, 1851; rendezvous, Norfolk, 1856; ordnance duty, Norfolk, 1857; steam-frigate "Roanoke," Home Squadron, 1859–60; navy-yard, Portsmouth, N. H., 1861.

Commissioned as commander, July 16, 1862; commanding steamer "Massachusetts," supply-vessel, Atlantic Squadron, 1862; commanding steamer "Mercedita," South Atlantic Blockading Squadron, 1863; was seven weeks in command of monitor "Sangamon," inside of Charleston Roads, employed on picket duty, and acting in concert with the army, constantly shelling Fort Sumter and the batteries on Sullivan's Island; stationed in Stono Inlet, S. C., as senior-officer, co-operating with the army in expeditions against the enemy, and frequently engaged at short range; commanding steamer "Sonoma," South Atlantic Blockading Squadron, 1863–64; commanding steamer "Glaucus," East Gulf Blockading Squadron, 1864–65; commanding steamer "Winooski," special service, 1866–67; navy-yard, Norfolk, 1867–69.

Commissioned as captain, December 2, 1867; commanding steam-frigate "Colorado," Asiatic Squadron, 1870–71; navy-yard, Norfolk, 1872; commanding "Roanoke," 1873–74.

Commissioned as commodore, June 5, 1874; commandant navy-yard, Pensacola, 1875–76; light-house inspector, 1876–77; president board of inspection, 1877–78; commandant navy-yard, New York, 1880.

Cooper, James Fenimore, novelist. Born at Burlington, N. J., September 15, 1789; died at Cooperstown, N. Y., September 14, 1851. He studied at Yale, but did not graduate, and in 1811, after six years' service in the navy, married a Miss De Lancey, and settled at Mamaroneck, N. Y. His first work, "Precaution," published anonymously in 1821, was followed by "The Spy," "The Pioneers," 1823, and the "Leather-stocking Tales," which gave him great popularity. This was increased by his sea novels, "The Pilot," "Red Rover," "Water-Witch," "Two Admirals," "Wing and Wing," etc., and by "The Bravo," "Heidenmaur," and "Headsman," published during a visit to Europe

in 1826–33. After his return he published "Letters to his Countrymen," "Homeward Bound," and "Home as Found," which somewhat lessened his popularity. Besides his works of fiction, he wrote a "History of the United States Navy," (2 vols. 8vo), "Battle of Lake Erie," 1843, "Lives of American Naval Officers" (2 vols. 12mo), 6 vols. of "Gleanings in Europe," "Sketches of Switzerland," and a comedy, performed at Burton's theatre, New York, in 1850. The latter part of his life was imbittered by quarrels and lawsuits with the editorial fraternity. His latter productions were unworthy the high fame which Mr. Cooper justly deserved and enjoyed.

Co-ordinates. A set of lines, angles, or planes, or a combination of these, which, taken together, define the position of a point, or points. There are two systems of co-ordinates, the *rectilinear* and the *polar* system.

CO-ORDINATES FOR THE CELESTIAL SPHERE.

Ecliptic System. Latitude and Longitude.

Equinoctial System. 1. Right Ascension and Declination. 2. Hour-angle and Polar Distance.

Horizon System. Azimuth and Altitude.

CO-ORDINATES FOR THE TERRESTRIAL SPHERE.

Latitude and Longitude.

Coot. A water-fowl of the genus *Fulica*, frequenting lakes and other still water. The common coot has a bald forehead and a black body; the toes are long and not webbed, but bordered by a scalloped membrane. The name is sometimes applied to a stupid person.

Cop, or Copt. The top of a conical hill.

Cope. An old word for cape. *To cope* is to bend or arch.

Copeck. A Russian copper coin, a hundred of which make a rouble; it is worth about three-quarters of a cent.

Copenhagen. The capital of Denmark, and one of the finest cities of Northern Europe, situated on the sound, chiefly on the east coast of Seeland, but partly on the island of Amager, which is separated from Seeland by a narrow arm of the sound, which forms a harbor, spacious, deep, and secure. Lat. 55° 40′ 9″ N.; lon. 12° 34′ 7″ E. The shipping of Copenhagen is extensive, nearly all the heavy trade of the kingdom centring there. Pop. 198,000.

Copernican System. Nicholas Copernicus was born at Thorn, Prussia, in 1473; died 1543. A few days before his death the printing of his book on the "Revolution of the Celestial Bodies" was completed. The Copernican system represents the sun to be at rest in the centre, and the planets to move round it in ellipses; in other words, it is that which we now know to be the true system of the universe. It receives its name from Copernicus, but, in point of fact, it may be described as being a growth to which he was only one of many contributors.

The merit of having first formed the general notion of the system seems to be due to Pythagoras; Copernicus has the credit of having, after the lapse of centuries, again drawn the attention of philosophers to it, and of having greatly increased the probability of its truth by his calculations and arguments. The most valuable part of the "De Revolutionibus" is that in which is explained, for the first time, the variation of the seasons, the precession of the equinoxes, and the stations and retrogradations of the planets. In general, the explanations are right, and perfect as to the general nature of the causes of the phenomena.

Copill. An old term for a variety of the coble.

Copper (Lat. *cuprum*, a corruption of *Cyprium*, from the island of Cyprus, whence it was formerly brought). A reddish, malleable, tenacious, ductile metal, of which the symbol is *Cu*; specific gravity, 8.7 to 8.9; fusing-point, about 2000° Fahr. It is found native and in various ores; as, copper pyrites, copper glance, red oxide of copper, and malachite. Its salts are generally poisonous, but brilliant, and used extensively in the arts. Its uses are various; alloyed with tin or zinc, it is used in bells, ordnance, and machinery; drawn out into wires, it is used for lightning conductors and electrical cables; beaten out into thin sheets, it is used for sheathing wooden ships, in which case the fastenings should be of copper. The green rust which forms on the sheathing of ships is a carbonate of copper, and is very poisonous.

The sulphate of copper, or blue vitriol, is employed in the preservation of timber from dry rot.

COPPERED, or COPPER-BOTTOMED. Having the bottom sheathed with thin sheets of copper, to protect the planking from mollusks, cirripeds, and weed.

COPPER-FASTENED. A ship is *copper-fastened* when the bolts are of copper instead of iron in that part immersed in the water. When these bolts are of iron, galvanic action is set up between the bolts and the copper sheathing.

Coppers. The ship's boilers for cooking; the name is used even when the boilers are made of other material than copper, which is now the case. *Hot coppers* is a term used to denote a state of extreme thirst, particularly when it is the consequence of a debauch.

Corab. A sort of boat, otherwise called *coracle*.

Coracle. An ancient British truckle or boat, constructed of wicker-work, and still in use among Welsh fishermen and on the Irish lakes. It is covered by skins, oil-cloth, etc., which are removed when out of use; it is of an oval form, and contains one man, who, on reaching the shore, shoulders his coracle, deposits it in safety, and covers it with dried rushes or heather. The Arctic *baidar* is of similar construction. It is probably of the like primitive fabric with the *cymba sutiles* of Herodotus.

Coracora. See KORACORA.

Coral. A name applied to the hard calcareous support or skeleton of many species of marine zoöphytes. The coral-producing animals abound chiefly in tropical seas, sometimes forming, by the aggregated growth of countless generations, reefs, barriers, and islands of vast extent. The "red coral" (*Corallium rubrum*) of the Mediterranean is highly prized for ornamental purposes.

Coralan. A small open boat for the Mediterranean coral-fishery.

Cor Caroli (Lat. "Charles' Heart"). See CANES VENATICI.

Cordage. A general term for the ropes on board ship. See ROPE.

Cordilla. The coarse German hemp, otherwise called *torse.*

Cordlie. A name for the tunny fish.

Cordovan. Leather made from seal-skin; the term is derived from the superior leather prepared at Cordova in Spain.

Core. The internal mold which forms a hollow in casting, as in a gun. The insulated wire of a submarine cable.

Cor Hydræ. *α Hydræ,* called also Alphard. See HYDRA.

Cork. A city and river port of Ireland, capital of the county of Cork, on the Lee, 11 miles above the entrance of Cork harbor, and 137 miles S.W. of Dublin. The city proper is built on an island formed by the Lee, which river is crossed by bridges. Cork communicates by steam with London, Dublin, Bristol, Liverpool, and Glasgow. Pop. 79,000.

Corkir, or Cudbear. The *Lecanora tartarea,* a lichen producing a purple dye, growing on the stones of the Western Isles and in Norway.

Cor Leonis. *α Leonis,* called also Regulus. See LEO.

Cormorant. A well-known sea-bird (*Phalacrocorax carbo*) of the family *Pelecanidæ.*

Corned Powder. Powder granulated from the mill-cakes and sifted.

CORNS OF POWDER. Small grains of powder.

Coromontine. A tribe of negroes in the interior of Africa. They are very ferocious, and when sold into slavery prove very troublesome to their masters.

Corona. A peculiar phase of the *aurora borealis.* A circle around the moon during a total eclipse of the sun. Frequently when there is a halo encircling the moon, there is a small corona more immediately around it.

Corona Australis. See CONSTELLATION.

Corona Borealis (Lat. "The Northern Crown"). A constellation lying between *α Lyræ* and Arcturus. *α Coronæ Borealis,* Alphecca.

Corouse. The ancient weapon invented by Duilius for boarding. An attempt was made in 1798 to re-introduce it in French privateers.

Corphoun. A name for the herring.

Corporal. A non-commissioned officer of marines, next in rank to a sergeant.

CORPORAL, LANCE. A private marine doing the duty of a corporal.

CORPORAL, SHIP'S. A petty officer to assist the master-at-arms in his various duties. See MASTER-AT-ARMS.

Corposant. See ST. ELMO'S FIRE.

Corps. A body of officers, or officers and men; as, the medical corps, the marine corps, etc.

Corpse. Jack's term for the marine guard,—the corps.

Correction. An allowance made for inaccuracy in an instrument; as, compass correction, chronometer correction, etc.

Corryne-powder. Corn-powder, a fine kind of gunpowder.

Corsair. A pirate, or piratical vessel. The term was applied more particularly to the piratical cruisers of Algiers, Tunis, and Tripoli.

Cor Scorpionis. *α Scorpionis,* called also Antares. See SCORPIO.

Cortez, Fernando. The history of Spanish discoveries on the continent of America reveals few names of greater celebrity than the discoverer and conqueror of Mexico. Accompanying Velasquez on his expedition to Cuba, he recommended himself by his talents and courage to his chief, who deputed him to visit the western coast and establish colonies. In February, 1519, Cortez coasted the peninsula of Yucatan, and stopping at San Juan de Ulloa, received information which led him at once to found a settlement at Vera Cruz and proceed to the court of Montezuma. Ultimately he conquered the whole kingdom of Mexico, and giving it the name of New Spain, annexed it to the Spanish crown. Not realizing the recompense he expected, he abandoned his views in respect to the military government of the new possession, and proceeded on an exploratory voyage northerly. In 1536 he discovered the peninsula of California, and surveyed a part of the gulf which separates it from the American continent. But reaping neither profit nor honor, excepting as a geographical discoverer, he returned to Spain in 1540 to die in seclusion, after serving Charles V. against the Algerians.

Corunna, a fortified city of Spain, capital of the province of Corunna, is situated on a bay of the Atlantic, 320 miles N.W. of Madrid. Lat. 43° 22′ 5″ N.; lon. 8° 22′ 7″ W. Its harbor is safe, and defended on the east by Fort San Diego and west by Fort San Antonio. A great part of its population is employed in the herring- and pilchard-fishery. Some ship-building is carried on, and there is a school of navigation. Pop. 30,000.

Corvette. (Lat. *corbita;* Sp. *corbeta;* Fr. *courvette, corvette*). A name common in the French navy, in the days of wooden ships, to a class of vessels of war ranking, in military value, next after the frigate, to which, in rig and general appearance, they bore a resemblance. The equivalent in the English navy was a "Jack-Ass" frigate; but in the navy of the United States the general term sloop-of-war is applied to all vessels between a frigate and a brig. The French corvette of the first class had a covered battery and carried guns on the forecastle and quarter-deck. The razeed frigates of the "Cumberland" class were our nearest approach to the heavier French corvettes. Thirty years ago, the battery of a French corvette, *à batterie couverte et à galliards armés,* varied from 20 to 32 guns; that of a *corvette à batterie barbette* (single-decked sloop-of-war) varied from 14 to 24 guns.

The term *corvette* comes from *corbita,* a basket, the sign worn at the mast-heads of the Egyptian grain-ships as the symbol of their trade. This gave the name to a class of vessels, originally vessels of burden (*naves onerariæ*). In time the name came to be applied to a light and fast galley of one mast, and propelled by both sails and oars. The name occurs in the history of the Italian navies of the middle ages. It made its appearance in the French navy about the year 1687. The *corvette* was then used, on account of its lightness and speed, as a look-out ship attached to a fleet, and for carrying dispatches.

Corvette-aviso, a light, fast sloop-of-war used in more modern times as a dispatch-vessel. The name has sometimes been applied, in the French navy, to a certain class of brigs-of-war.

Corvette de charge, a store-vessel, or transport.

The term *corvette* has never been adopted in the United States navy.—*S. B. Luce, Captain U.S.N.*

Corvus (Lat. "The Crow"). *a Corvi*, Alchiba.

Cosier. A lubber; a botcher.

Cosmical. Rising and setting with the sun; the opposite of achronical.

Coss. An East Indian measure of distance, varying from one to one and a half miles.

Costal. Relating to the coast.

Cot. A wooden frame inclosed in canvas, and suspended from the beams; it is used as a sleeping-place by invalids, and sometimes by officers.

Cote, or Cot. An old term for a small boat.

Cotter, Cutter, or Key. In machinery, a wedge-shaped piece of metal, usually steel, used for adjusting and confining bearings to journals. It is generally secured in position by a screw.

Cotton, Gun-. See EXPLOSIVES.

Cottonina. The heavy canvas used for sails in the Levant.

Coubais. An ornamental Japanese barge of 40 oars.

Coud. An old word for *conn.*

Coulter-neb. A name of the puffin (*Fratercula arctica*).

Counter. The portion of a ship from the water-line to the knuckle of the stern.

COUNTER-RAIL. The ornamental rails across the stern into which the counters finish.

COUNTER-TIMBERS. Timbers worked on each side of the stern-post in all round and elliptical sterned ships to form the rake and contour of the stern.

Counter-brace. The lee fore-topsail brace is so called during the operation of tacking, from its being hauled in, after the sails catch aback, to flatten the sail against the lee side of the topmast, and thus increase the effect of the wind in forcing the ship's head around. *To counterbrace the yards* is to brace the head-yards up one way and the after-yards the other. The yards are counter-braced while at anchor to diminish the force of the wind acting on them; they are sometimes counter-braced in a calm to be in readiness to take advantage of any breeze that may spring up; they are counter-braced while under way to check the headway or to heave-to.

Counter-current. A current running in the opposite direction to the main current.

Countermand. To revoke, as a former command; to annul, or prohibit the execution of, a previous order.

Counter-mold. When a piece of timber molded on both sides as a breasthook, is intended to come to its place accurately, the following operation is gone through with:

After one edge, say the upper one, is accurately shaped to the mold, the bevelings are taken square from the piece and applied directly to the part to which the breasthook is to be fayed. Then the counter-mold is laid upon the piece to fit the spots which have been found after the bevels and square spots have been produced upon the other face of the breasthook to be counter-molded; they agreeing, the piece may be confidently trimmed through to the first molding-edge.

Counter-sea. A sea running in an opposite direction from the wind.

Countersign. A private word or phrase which is given out by the commanding officer of the marines at a navy-yard; every one who enters the yard between tattoo and reveille is required to give the countersign at the gate, and to every sentry by whom he may be challenged. See PAROLE.

Countersunk. Sunk so as to be even with or below the surface; as, a countersunk bolt.

Country. That portion of an apartment on board ship which is used in common by all the officers of the same mess; as, the wardroom country, or that portion of the wardroom between the two rows of state-rooms.

Coup d'œil. That talent of quick observation by which a person by a single glance at the situation of affairs detects its strong and weak points, and is thereby enabled to manœuvre to the best advantage.

Coup de grace. A decisive finishing stroke.

Coup de main. A sudden attack or enterprise.

Coupling. In mechanism, any device for joining separate parts together so that they may be easily disconnected, such as sections of shafting, piping, or hose. The coupling of shafting is accomplished by the use of flanges, either wrought or cast upon the shaft or rigidly attached thereto, secured by bolts and keys. Large pipes are coupled by flanges and bolts; small ones by screw couplings called "union couplings." Sections of hose are connected by screw couplings. In cases where instantaneous coupling or uncoupling is required, the "clutch" or "friction coupling" is used. In these arrangements one flange is free to slide in the direction of the axis of the shaft, but by means of "feathers" rigidly compelled to turn with it, the sliding motion being controlled by levers. In the clutch the faces of the flanges have interlocking projections; in the friction coupling two accurately fitted conical faces are forced together.

Coureau. A small yawl of the Garonne. Also, a narrow strait or channel.

Course. The angle which a ship's track makes with the meridians, this angle being referred either to the true meridian or to the position of the magnetic needle by which the ship is steered. The former is the *true* course, the latter the *compass* course. To obtain the true course, the course steered must be corrected for leeway and for the variation and deviation of the compass. The course *made good* is the bearing of the position *in* from the position *left.*

Courses. The sails which are bent to the lower yards; the fore, main, and mizzen staysails are sometimes comprehended under this term.

Courset. The paper on which the night's course was set, as a memorandum for the officer of the watch. See NIGHT ORDERS.

Coursey. A space in the galley; a part of the hatches.

Court-martial, *n.*; *pl.* Courts-martial; pro. cort-mar′-shal. A tribunal composed of military or naval officers appointed for the trial of offenders against military or naval laws.

Derivation.—COURT, from O. Fr. *court* or *cort*, and N. Fr. *cour*, from Latin *chors*, *chortis*, and *cohors*, *cohortis*, meaning an inclosure, court, crowd, or throng. MARTIAL, from Lat. *martialis*, from *Mars*, the god of war: hence pertaining to war; suited to war; military.

The word court, *curia*, in its law sense, means the place where justice is judicially administered, and as well the assemblage of judges, jury, *et al.*; and this employment of the word, which in its primitive and restricted sense meant "an inclosure without a roof," and then "a palace, or residence of a king," is evidently attributable to the fact that in ancient times the king, as chief magistrate or ruler, was regarded as the fountain of justice, and sometimes the dispenser, sitting in person as late as Edward IV. to hear and determine causes. The palace used for this purpose became known as "the court," which gradually grew to denote also the assembly.

History.—The court-martial of to-day appears to be the offspring and heir of the old *Curia Militaris*, or Court of Chivalry, called also the Marshal's Court, which at one time was the only military court established by the laws of England. In the beginning it was held before the lord high constable and earl marshal jointly, but after the attainder of Stafford, Duke of Buckingham, in the reign of Henry VIII., and the consequent extinction of the office of lord high constable, it was, with respect to civil matters, held before the earl marshal only. This court, by statute (13 Richard II., c. 2), had cognizance of "contracts and other matters touching deeds of arms and war," as well out of the realm as within it, and was in great reputation in the times of pure chivalry, and later, during England's connection with the continent by her territories in France. It was a *military* court, or court of honor, when held before the earl marshal only, and also a criminal court when held before the lord high constable; but both of these parts of its authority had fallen into disuse early in the present century, on account of the feebleness of its jurisdiction and want of power to enforce its judgments. Not being a court of record, it could neither fine nor imprison, and an appeal from its sentence had to be made immediately to the king in person.

The modern form of military courts was adopted by ordinance in the time of Charles I., when English soldiers were studying the Articles of War of Gustavus Adolphus, and is first recognized by statute in the original Mutiny Act, 1689 (1 William and Mary, c. 5).* By this act, annually renewed "for the regulation of the army," the sovereign is authorized to grant from time to time "a commission, under his royal sign-manual, to any officer not under the degree of a field-officer for holding a general court-martial." He could also extend by warrant to the lord lieutenant of Ireland, the governor of Gibraltar, or of any of "the dominions beyond the seas," authority to appoint courts-martial. Although nearly two hundred years have passed since this enactment, it remains the fountain of military law; many of its provisions are in force unchanged, and nearly all have been adopted in modified form into the codes of this country. The student will discover many interesting similarities by recurring to its text.

Naval law, and military law proper, seem always to have possessed wider points of difference than the varying circumstances call for. The early naval law of England, which is styled "barbarous," was long intrusted for its administration to the discretion of commanders acting under instructions from the Lord High Admiral, who was supreme over both the royal and merchant navy.

In 1645 the leaders of the Long Parliament secured something like a regular tribunal by passing "An Ordinance and Articles of Martial Law for the Government of the Navy." Under this authority "general and ship courts-martial with written records" were established; the one for captains and commanders, and the others for subordinate officers and men. Of the latter, the mates, gunners, and boatswains could be members, but the admirals reserved control over the more serious offenses. A later law (Act 13, Charles II., c. 9) again gave the Lord High Admiral power to issue commissions to hold courts-martial, which power continues to be exercised by the Board of Admiralty. The court of the High Admiral had civil jurisdiction in all maritime causes, and in criminal cases to all crimes committed upon the seas, on fresh water "within flood-mark," and in all harbors, creeks, etc.

In 1749, through the exertions of Anson, a very stringent act was passed, in which the death penalty was affixed to a multitude of offenses,—a circumstance which no doubt accounts for its frequent occurrence to-day in our naval code, though most rarely imposed; so rarely, indeed, that a yard from which a culprit has been hanged becomes historical, and is followed, in memory, from ship to navy-yard and from navy-yard to ship by the sailors of the service.

Administration.—The important matter of administering law and justice by means of courts-martial in the U. S. navy has until recently been lamely and imperfectly conducted. There is still lacking a corps of trained judge-advocates, such as is possessed by the army, and it has happened that the dignity and efficiency of a court, and the character and value of the very essential office of judge-advocate, have all been belittled by the appointment to the latter duty of officers unwilling and wofully incompetent. There was also a scarcity of applicable knowledge, properly systematized and arranged, both as to learned treatises and manuals. Until 1846, except a small book by Major-General Macomb, U.S.A., there was no strictly American authority on courts-martial. In that year Captain Wm. C. De Hart, 2d U. S. Art., published a work on "Military Law adapted to the United States Army and Navy," which contained much of value and is still quoted.

Books of foreign origin, generally English, were previously employed, and the practice of our courts-martial was often both inconsistent and contradictory. Errors were frequent; there was no settled and uniform interpretation of either the law or the mode of procedure, and hence proceedings were often disapproved and set aside for informalities and omissions. The requirements of parliamentary enactments were confused with the general principles of law, and, to increase the difficulties, our own statutes, for unfathomable reasons, prescribed differences in practice and power between courts of the army and navy of the same degree and jurisdiction, as to rank and offense, some of which still exist. Captain De Hart's book, as well as that of Cap-

* Occasioned by a mutiny in a body of English and Scotch dragoons and infantry ordered to Holland to replace some Dutch troops transferred to England.

tain (now Brigadier-General) S. V. Benét, which followed, were more especially for the use of the army, and naval officers were left to apply their contents as their best intelligence might direct. This did not tend to lessen much the want of uniformity of action, although the books did great good in other ways. Perceiving the necessity for a concise compilation of the laws, regulations, and customs "distinctly naval," Rear-Admiral A. A. Harwood, U.S.N., prepared (1867) the book which bears his name, and it is now a generally accepted authority as to the administration of law in the navy.

Constitution and Organization.—The power "to make rules for the government of the land and naval forces" is vested in Congress by the Constitution (Art. 1, Sec. 8) and the Revised Statutes (Sec. 1624), and the acts passed subsequent to December 1, 1873, are "the laws which define the powers and duties, and regulate the organization and mode of procedure" of naval courts and boards.* To the mandates of these laws are to be added a portion of the Navy Regulations (1876), parts of a Manual for the Administration of Law and Justice, issued by the Navy Department (1870), and such orders, regulations, and instructions as the Secretary of the Navy has adopted, "with the approval of the President," subject to alterations adopted in the same manner, all of which have been given the force of law (Rev. Stat., Sec. 1547), with penalty in case of failure to obey. (*Ibid.*, Art. 8 of Sec. 1624.) No court-martial can be constituted or can claim jurisdiction except in direct accordance with these laws.

By them courts-martial of two kinds are authorized, viz., general and summary. The first is for the trial of offenses committed by "any person in the naval service,"† and may be convened as often as the President of the United States, the Secretary of the Navy, or commander-in-chief of a fleet or squadron shall deem it necessary; but, in the waters of the United States, no commander-in-chief shall convene such court-martial "without express authority from the President." It is the highest naval judicial authority, and must consist of not less than five nor more than thirteen commissioned officers as members; "and as many officers, not exceeding thirteen, as can be convened without injury to the service, shall be summoned on every such court." In no case, where it can be avoided without injury to the service, shall more than one-half, exclusive of the president, be junior to the officer to be tried. The convening authority has full and final discretion as to what would cause injury to the service.

The number and rank of the officers selected is usually governed by the grade of the offender and the gravity of the offense. A full court of thirteen officers is very seldom convened. Seven and nine are the most frequent numbers. In the British navy the legal maximum, formerly thirteen, was, in 1868, reduced to nine; the minimum remaining the same,—five. Custom prescribes in any case an odd number upon organization; but, if the original detail be reduced by sickness, detachment, or casualty pending a trial, the court continues its labors, unless otherwise directed, until fewer than five assemble. Should the circumstances of a case demand a court of thirteen to be assembled and maintained, it is customary to detail supernumerary officers, necessarily juniors, to fill vacancies which may exist upon organization or occur later.

The mode of convening a court is by a written or printed order, or precept, addressed to the senior officer named in the detail, who presides by virtue of his rank. The precept recites the authority by which it issues; fixes the day, hour, and place of assembly; states who is to be tried; and names the officers who are to compose the court in the order of their rank. The person who is to act as judge-advocate is also named, and the whole is signed by the officer ordering the court, with his rank and title. A separate written appointment, which is also an order to report to the presiding officer of the court, is sent to each member and to the judge-advocate. All commissioned officers on the active list are eligible to membership, but subject to challenge by both the accused and the judge-advocate. The latter, having no vote, cannot be challenged. If an officer of the medical, pay, marine, or engineer corps is to be tried, it is deemed proper, if the exigencies of the service will permit, that at least one-third of the court shall be composed of officers of the same corps. When thus associated on courts or boards, line and staff officers take precedence according to rank, and wear the service-dress uniform, without swords, unless otherwise specially directed. (N. Reg., 1876.) Other officers attending courts-martial as witnesses or in any capacity wear the same. Formerly the full-dress uniform (cocked hat, epaulets, and sword) was customary, and a court-martial was an affair of much state, and great discomfort. Judge-advocates are appointed by the Secretary of the Navy only (see JUDGE-ADVOCATE), and provost-marshals by the president of the court. See PROVOST-MARSHAL.

At the time and place appointed the officers assemble, and present their orders to the presiding officer, who indorses them "Reported," adding the date and signing officially. He takes his seat at one end of a long table prepared for the use of the court, and assigns the others their seats according to rank, the first on his right, the second on his left, and so on alternating to the junior. The judge-advocate sits at the opposite end, and the accused, who has previously been placed in arrest or confinement, is introduced unfettered, unless violent, or escape be apprehended, and sits on his right, where a small table is placed for the use of himself and counsel. A chair is placed on the left of the judge-advocate for witnesses, and others are furnished for spectators, all courts-martial being public except when cleared for deliberation.

The order convening the court and the appointment of the judge-advocate are then read aloud to the accused, standing, by the judge-advocate, who asks if he objects to any officer named in

* The army and navy are governed by separate and special laws as distinct communities, the code of the former being known as "The Articles of War," originally 101 in number, approved April 10, 1806; and that of the latter as "The Articles for the Better Government of the Navy," originally 25 in number (now 60), approved July 17, 1862, and all incorporated in the Revised Statutes. The first rules for the regulation of the navy were established by a resolution of Congress, November 28, 1775. These were succeeded, March 2, 1779, by a very complete code of 50 articles, many of which continue operative.

† This includes members of the marine corps, except when serving with the army by order of the President. (Rev. Stat., Sec. 1621.)

the order sitting on his trial. If yea, the objection is recorded, and the challenged party withdraws until the objection is considered. Should the accused demand it, the member may be put upon his *voir dire*, the oath being administered by the judge-advocate. Personal interest in the case, prejudice, animosity, an expression of opinion for or against, having been a member of a court of inquiry to investigate the charges, or having preferred the charges, are good grounds for challenge. All objections having been acted upon, the oaths, or affirmations, prescribed by law are administered in the presence of the accused. *First*, by the presiding officer to the judge-advocate; *second*, by the judge-advocate to the members of the court (see OATHS), and the fact so recorded. Failure to do this as thus described would be a fatal defect. While the court is being sworn all in the room stand, and the utmost silence prevails. Each member who does not elect to affirm places his right hand, ungloved, on the Holy Bible, and the judge-advocate, holding the book, and addressing each by name, reads the oath. The president then "kisses the book," as does each in turn, according to rank, passing it along. All are sworn to secrecy as to the sentence and the vote or opinion of any particular member; also to try the case depending impartially.

Jurisdiction, Powers, and Duties.—The court is now organized, and has a special jurisdiction co-extensive with the face of the earth; that is, for an offense committed in Brazil, for instance, the offender may be tried by a court convened in Massachusetts, or in the waters of Africa. This special jurisdiction embraces all naval persons of whatever condition, during the period of their obligation to serve, and in some cases longer, and all crimes or acts set forth in the laws and regulations for the navy, or which, if not specified, may be prejudicial to good order and discipline. Citizens, as a general rule, are not amenable, although they may become so under certain circumstances. A court-martial has no power to award pecuniary damages for injurious conduct. Its jurisdiction is criminal, and its judgments are penal. Bail is unknown. Any person who refuses to give evidence, or prevaricates, or behaves with contempt to the court, may be imprisoned by the court not to exceed two months; and for the crime of perjury, or subornation of perjury, may be prosecuted in any court of justice in the United States. All offenses committed while on shore are punishable in the same manner as if committed at sea. General courts only are competent to try capital offenses and commissioned officers, and to compel the attendance of witnesses who are subject to the authority of the United States.

Every accused person is entitled to a true copy of the charge and specification alleged against him, properly authenticated, at least twenty-four hours before he is brought to trial; and should he desire counsel, a stenographer, or a friend to assist in his defense, they are admitted and mentioned in the record. He is also entitled to a list of the witnesses who are to appear against him, and to have such witnesses summoned as are material to his defense. See WITNESS.

If the charges are found to be correct, and the accused is prepared for trial, they are read to him, and he is called upon to plead "Guilty" or "Not Guilty." Should he plead not guilty, or stand mute, testimony is taken. The judge-advocate summons the witnesses, and the president administers the oath to them "in the presence of the accused." (See OATHS.) They are examined first by the party calling them, then cross-examined by the opposite party, and, finally, the court puts such questions as it may consider necessary. All questions and answers must be recorded in full, and the evidence of each witness be read to him and be pronounced by him correct before he is discharged. The laws of evidence which obtain in civil courts are adhered to in the main, but the "numberless niceties" and minute distinctions are not always regarded.

The proceedings having commenced, the court is required by law to sit from day to day, Sundays excepted, until sentence is given, unless temporarily adjourned by the authority which convened it; and no member can absent himself "except in case of sickness, or of an order to go on duty from a superior officer, on pain of being cashiered." Testimony taken during the absence of a member must be read to him when he returns, and acknowledged correct by the witness, before he can resume his seat in that particular case. The president, as the organ of the court, is empowered to preserve order and decorum, to speak and act for the court in all cases provided for by law, custom, or its own resolution, and requires all persons called before it to be treated in a becoming manner. In all deliberations *the members are equal;* all questions are decided by a majority vote, the junior voting first; and the members are individually and collectively responsible to the civil judicature for any abuse of power, illegal or corrupt proceeding. A court has no power to punish its own members, and for disorderly conduct one is liable as in other offenses against the discipline of the service.

The prosecution is formally closed before the defense begins, and all orders, motions, votes, or rulings of the court, except its discussions, and all motions, propositions, arguments, or statements of the accused or judge-advocate,—in short, every fact necessary to a complete history of the case and a correct understanding by the reviewing authority, is recorded. Upon completion of the evidence the accused is allowed time to prepare and submit his written defense, to which the judge-advocate has the right to reply.

The court is then cleared for deliberation, and after deciding upon its *finding*, or verdict, adjudges sentence, in each case by ballot. The court can find guilty in a less degree than charged, but in all cases of conviction must adjudge punishment adequate to the offense. Every member must vote upon a sentence whether he believes the accused guilty or not. A sentence of death requires the concurrence of two-thirds of the members present, but all others may be determined by a majority of votes. The discretion of a naval court-martial as to punishment is very great, only "flogging, branding, marking, or tattooing on the body" being prohibited by law. Shaving the head, drumming out of the service, extra guard duty, and ball and chain, though lawful, have within the last fifteen years grown into disfavor and are nearly obsolete. Courts-martial have no power to par-

don or mitigate, but the members can recommend a convicted person to clemency.

The record and judgment of the court, after being signed by all of the members present and the judge-advocate, is sent to the officer who convened it for review. He has authority to send it back for revision and amendment, if needed, or can approve or disapprove it, remit or mitigate, but not commute, the sentence. He can also execute any sentence which does not extend to loss of life, or the dismissal of a commissioned or warrant officer, which must be submitted to the President. All proceedings are now (1880) required to be sent direct to the judge-advocate-general of the navy to be revised, reported upon, and filed. See JUDGE-ADVOCATE-GENERAL.

No court can terminate its own existence; therefore, when the record is passed upon and the action of the reviewing authority written upon it, an order is addressed to the presiding officer dissolving the court. Another order may also issue announcing to the service the result of the trial. Since February 4, 1879, the Navy Department has published a regular series of "court-martial orders" promulgating trials by general courts, which are of much value as a means of discipline and for reference.

Decisions.—An officer detailed on a court or board of any kind is excused from other duty while so serving. An officer promoted while on a court gives public notice thereof to the court, and the fact is noted in the record. The convening authority may direct the judge-advocate to enter a *nolle prosequi* at any time after trial has commenced. A mere withdrawal of charges does not prevent them from being again preferred. The power to remit is the same as that to pardon, and is co-ordinate with that to execute. It is essential to the validity of a pardon that it should be accepted. (See PARDONING POWER.) A crime committed during desertion is cognizable by a court-martial. An adjournment *sine die* does not prevent a court from reassembling.

Exalted rank gives no additional latitude or privilege,—all prisoners are equal before the law. The administration of justice ceases to be pure when not strictly impartial. "Where the proper reviewing officer has confirmed the sentence of a competent court-martial, of which the proceedings were regular, and has dissolved the court, the judgment is final; no appeal can be taken from it, or new trial ordered by the President." Relief must be found in pardon.—*Henry C. Cochrane, Captain U.S.M.C.*

Court-martial, Summary. "Summary courts-martial were established for the trial in the navy of such lesser offenses as the commanders of vessels may deem deserving of greater punishment than they are by law authorized to inflict upon petty officers and persons of inferior rating under their command, but not sufficient to require trial by general court-martial." They have no power to try commissioned or warrant officers, nor any offense the proper punishment of which, in case of conviction, would be more severe than they are authorized to impose. Notwithstanding this plain provision, commanders of vessels have been known to disregard it and to refer to summary courts "the grave offense of desertion," for instance, which at the hands of a general court seldom receives less than one year's imprisonment with loss of pay. A summary court-martial cannot adjudge more than two months of confinement.

An act to provide a more efficient discipline for the navy, approved March 2, 1855, gave them being, and a subsequent enactment (1870) extended to commandants of navy-yards, naval stations, and marine barracks the authority to convene them. The person to be tried must belong to the command of the officer who orders the court, and the court must consist of three officers, not below the rank of ensign, as members, and a recorder, who may be any officer of the command. The court is convened by a brief written order addressed to the senior member, who presides, stating the detail and the time and place of meeting, and by verbal orders to the other members and the recorder. Where a person belonging to the marine corps is to be tried, one or more marine officers are to be on the court if possible.

Before proceeding to trial, the recorder administers an oath to the members to try the case without prejudice or partiality, and the senior member swears the recorder to keep a true record of the proceedings. (See OATHS.) All testimony is given orally upon oath or affirmation administered by the senior member. A schedule of seven punishments is prescribed, any one of which may be inflicted, and to it may be added "extra police duties and loss of pay not to exceed three months." A summary court may also disrate any rated person for incompetency. Sentences are not executed until approved by the officer ordering the court, and by the commander-in-chief or senior officer present, and a sentence involving "loss of pay" must be referred to the Secretary of the Navy. Sentences can be remitted in part or altogether, but cannot be commuted, and where, in the opinion (in writing) of the senior medical officer of the command, the execution of a sentence would seriously injure the health of a prisoner, the case can be submitted again without delay to the same or another court, which can, upon the testimony already taken, change the punishment to some other of those authorized.

The proceedings are to be conducted with as much conciseness and precision as may be consistent with the ends of justice, and under forms and rules prescribed by the Secretary of the Navy, with the approval of the President. Summary courts are required to follow the same forms of procedure and rules of evidence as are observed by general courts, so far as applicable, and their proceedings must be transmitted to the Navy Department. The court is dissolved by the authority which ordered it to convene. No statistics of summary courts are available, but it is known that in some commands they are very frequent, and in others of rare occurrence, depending almost entirely upon the judgment or caprice of commanding officers. Judiciously employed, they are undoubtedly valuable adjuncts of discipline.—*Henry C. Cochrane, Captain U.S.M.C.*

Cove. An inlet in a coast; a recess in the seashore; a shelter, a cover.

The arch molding sunk in at the lower part of the taffrail. *My cove*, a familiar friendly term.

Coventry. *To send to coventry*, to ostracize; to banish from society; to cut off from social intercourse for a mean or ungentlemanly action.

Cover. Anything that is spread above or about another; as, a boom-cover, wheel-cover, etc. *Under cover*, sheltered from the elements or from the fire of an enemy. *To cover*, to protect, defend, or support; as, to cover a retreat, or a boarding-party.

COVERING-BOARD. A term used in the building of schooners and fishing-vessels. It is the water-way and plank-sheer combined in one piece of timber, and covers both the inner and outer planking, the stanchions cutting through these pieces of timber. It is sometimes called the "plank-sheer."

Cow. The female whale. *To cow*, to depress with fear.

Cowan. A fishing-boat of Scotland.

Cow-hitch. A slippery or lubberly hitch. Two half-hitches in which the end parts come out parallel and in the same direction; used for securing the hauling part of the laniards of lower and topmast rigging.

Cowhorn. Jack's name for the coehorn.

Cowie. A Scotch name for the porpoise.

Cowl. The cover of a funnel.

Cowrie. Small shells, *Cypræa moneta*, used for money or barter in Africa and the East Indies.

Cox's Traverse. Up one hatchway and down another, to elude duty. See TOM COX.

Coxswain, or Cockswain. Derived from *cock*, a small boat, and *swân*, a swain or servant. A person who has charge of a boat and crew in the absence of officers. In double-banked boats he steers, but in single-banked boats he pulls the stroke oar, the boat being generally fitted with a yoke and steered by an officer.

COXSWAIN'S-BOX. The space comprised between the back-board and the stern of a boat.

Crab. A species of windlass or capstan. An animal of the class *Crustacea*, having the body covered with a shell called the carapax. *To crab*, to drift sideways; to make a great deal of leeway; from the peculiar motion of a crab. *To catch a crab*, see CATCH.

Crabbe, Thomas, Rear-Admiral U.S.N. Born in Maryland. Appointed midshipman from Pennsylvania, November 15, 1809. Engaged in an attack by a squadron of gunboats on three British frigates in Hampton Roads, June 20, 1813; also in repelling an attack made on Craney Island by the British forces, under command of Sir Sidney Beckwith and Admiral Cockburn, June 22, 1813.

Commissioned as lieutenant, February 4, 1815.

Commissioned as commander, March 3, 1835. Commanding sloop-of-war "Vandalia," West India Squadron, 1836–37. While in command of the "Vandalia," Fort Brook, Tampa Bay was given in charge of the navy for defense, in the absence of the army operating in the interior against the Seminole Indians. Commander Crabbe received the following commendatory letter from Gen. Jessup on this occasion:

"In dissolving the official relations in which we have stood to each other, so much to my satisfaction, for several months past, I cannot avoid the expression of the great obligations I am under to you and your command for the uniform, steady, and efficient support which you have at all times given to me,—a support most auspicious in its effects upon the results of the campaign, and which I shall always remember with the liveliest gratitude."

Commissioned as captain, September 8, 1841. Ordered to command frigate "Brandywine," Brazil Squadron. Commander of steam-sloop "San Jacinto," Mediterranean Squadron, 1852–53. Commander Crabbe served in the frigates "President," "Constellation," "United States," and "Java," line-of-battle ship "Delaware," sloop-of-war "Peacock." Commanded squadron on coast of Africa, in flag-ship "Jamestown," 1855–57.

Commissioned as commodore, July 16, 1862. Prize Commissioner, Eastern District Pennsylvania, 1864–65.

Commissioned as rear-admiral, July 25, 1866. Died in 1873.

Crabbler. See KRABLA.

Crack. Of superior excellence; as, a crack ship. *To crack on*, to carry a press of sail.

Crack-brained. Having a defective intellect.

Crack-hemp, or Crack-rope. A wretch destined to be hanged.

Cradle. The framing which is built upon the launching-ways, in which the ship rests as in a cradle, while in the process of launching. Supports for boats carried on the rail.

Craft (Ang. Sax. *cræft*, a trading-vessel). A general term for all kinds of vessels. *Small craft*, small vessels.

Crag. A rugged precipitous rock or cliff, whose strata, if vertical, subdivide into points.

Crager. An old name for a small lighter.

Craig-flook. The smear-dab, or rock-flounder.

Cramp. A spasmodic contraction of the muscles, frequently experienced in bathing or swimming.

CRAMPER. A yarn worn around the leg as a preventive of cramp.

Cramp-fish. The torpedo, or electric ray, the touch of which gives a light shock of electricity.

Crampings. The fetters of a prisoner.

Crampit. The piece of metal at the tip of a sword-scabbard.

Crampoon. See CREEPER.

Crance. A boom-iron.

Crane, William Montgomery, Commodore U.S.N. Born at Elizabethtown, N. J., February 1, 1784; died at Washington, March 18, 1846. His father, General William, severely wounded at Quebec, and a colonel in the Revolutionary army, died at Elizabethtown, July 30, 1814. Midshipman, May 23, 1799; lieutenant, July 20, 1803; commander, March 4, 1813; captain, November 22, 1814. Commanding the brig "Vixen," he distinguished himself in the attack on Tripoli, and was in the "Chesapeake" when attacked by the "Leopard." In July, 1812, while commanding the brig "Nautilus," he was taken by the "Southampton" frigate. On his exchange he was ordered to the lakes, where, in command of the "Madison" and "Pike" in Chauncey's squadron, he served with distinction for the remainder of the war. In 1827, in the flag-ship "Delaware," he commanded the Mediterranean Squadron, acting as joint commissioner with Mr. Offley, U. S. consul at Smyrna, to open negotiations with the Ottoman government. Appointed Navy Commissioner in 1841, and in 1842 chief of the Bureau

of Ordnance and Hydrography. He died by his own hand; cause unknown.

Crane. A machine for raising or lowering great weights, and, while holding them in suspension, transporting them through a limited horizontal distance. In its primitive form it consists essentially of an upright post, pivoted so as to swing freely on its vertical axis; a horizontal arm or "jib" projecting from the top of the post and strongly braced from near the bottom by a diagonal brace, and to which the pulleys and weights are suspended; pulleys rove with rope, wire-rope, or chain; a winding barrel for the rope or chain, and guys for controlling the horizontal position of the weight. The upper pulley may, by means of a "traveler," be moved to any desired position on the arm or "jib." Modern cranes are very elaborate in structure, and enable weights to be placed in position with great accuracy. Derricks are modifications of the crane.

CRANAGE. The liberty of using, and the money paid for using, a crane.

CRANE-BARGE. A low flat-floored boat fitted with a crane, for raising anchors, etc.

Crane-line (*Obs.*). A line from the spritsail topmast to the forestay to steady the former; also, a line to keep a lee backstay from chafing against the yards when braced sharp up.

Crang. The carcass of a whale after the blubber is stripped off.

Crank. In machinery, the simplest and most efficient device for transmitting a reciprocating rectilinear movement to a rotary motion. It was patented in the year 1780 by Mr. Pickard, of Birmingham, England, as "a method of deriving a rotary motion from a fire-engine by the intervention of a crank," but was rejected by the leading engineers of that day, including Boulton and Watt, on the ground that it caused great loss in economic effect; but it shortly superseded the famous "sun-and-planet motion" of Watt, and all "ratchet" devices, and is now familiar to all.

The theory of its action, showing that there is no loss in the transmission of power, may, by neglecting friction, including that due to the oblique action of the connecting-rod, and which is about equal in all combinations, be represented as follows:

Let L represent the length of stroke of piston;

r the length of the crank $= \frac{1}{2} L$;

p the total pressure on the piston;

p_1 the resultant force of p at right angles to crank;

θ any angular motion of the crank;

w work done during an infinitely small motion of crank;

W the amount of work done during one stroke.

Then the tangential moment tending to turn the crank may be represented by

$$p_1 = pr \sin \theta \quad . \quad . \quad . \quad (1)$$

and the work done through an infinitely small change in position by

$$w = p_1 d\theta = pr \sin \theta d\theta \quad . \quad (2)$$

This, if integrated between the limits $\theta = 0$ and $\theta = 180°$, will give the amount of work done during one stroke of the piston, and

$$W = pr\int_0^{180°} \sin \theta d\theta = p \text{ ver. sin } 180° - 0 = p\,2r = pL \quad . \quad . \quad (3)$$

—*Albert Aston, Chief Engineer U.S.N.*

CRANK-AXLE. In "inside connected" locomotive-engines, the axle of the forward driving-wheels, upon which the cranks are forged.

CRANK-HATCH. In side-wheel steamers, a hatch around or above the cranks.

CRANK-PIN. A cylindrical piece of metal fitted to or wrought upon the end of a crank, forming a journal for the connecting-rod. Fitted pins are usually made of steel.

CRANK-SHAFT. In screw-propeller engines, a section of the shafting containing the main journals, cranks, and crank-pins. It may be forged of wrought iron or cast of steel in one solid piece, or, when the cranks have sufficient length, they and their pins may be made separately and fitted together, making what is called a "built-up" crank-shaft.

CRANK-WHEEL. A cast-iron wheel carrying a crank-pin, and used as a substitute for a crank.

Crank, or Crank-sided. That quality in a vessel which renders it incapable of carrying sail without danger of capsizing. It may be the consequence of a faulty construction, or of an injudicious stowing of the ballast and cargo.

CRANKY. Crank. Touchy; easily irritated.

Crappo, Johnny Crappo, or General Crappo. Jack's appellation for a Frenchman.

Crare, or Crayer. An unwieldy trading-vessel of olden times.

Crater (Lat. "The Cup"). *a Crateris*, Alkes.

Craven, Thomas T., Rear-Admiral U.S.N., was born in the District of Columbia. Appointed from New Hampshire, May 1, 1822; promoted to passed midshipman, May 24, 1828; commissioned as lieutenant, May 27, 1830; commissioned as commander, December 16, 1852.

Commissioned as captain, June 7, 1861; commanding sloop-of-war "Brooklyn," Home Squadron, 1861–62; while in command of the "Brooklyn," participated in the attack upon and passage of Forts Jackson and St. Philip. In this action, Capt. Craven's vessel became entangled in the hulks and rafts which sustained the chain barricade of the river, and, while in this situation, received a severe fire from Fort St. Philip, and was attacked by one of the enemy's rams and a large rebel steamer; the latter received a broadside from the "Brooklyn," at sixty yards, so well delivered as to end the conflict, so far as the steamer was concerned.

The ram struck the "Brooklyn" at the starboard gangway, but the chain-armor proved a perfect protection. By this time the "Brooklyn" had swung clear of the obstructions, and passed on up the river. Capt. Craven continued in command of the "Brooklyn," taking part in all the engagements along the Mississippi River, up to and including that of Vicksburg, until late in the summer of 1862, when he was detached and ordered North.

Commissioned as commodore, July 10, 1862; commanding steam-frigate "Niagara," special service, European waters, 1864–65.

Commissioned as rear-admiral, October 10, 1866; commandant of navy-yard, Mare Island,

California, 1867–68; commanding North Pacific Squadron, 1869. Retired Dec. 1869.

Craven, Tunis Aug. Macdonough, Commander U.S.N. Born in Portsmouth, N. H.; killed in the ironclad "Tecumseh," destroyed by a torpedo in Mobile Bay, August 5, 1864. Midshipman, February 2, 1829; lieutenant, 1841; commander, April 24, 1861. He had twenty years' sea-service, and eight years in the coast survey, and during the civil war commanded the "Crusader," the "Tuscarora," and the "Tecumseh."

Craw-fish, or Cray-fish. A lobster-like crustacean (*Astacus fluviatilis*), found in fresh water.

Crawl. A sort of pen, formed by a barrier of stakes and hurdles on the sea-coast, to contain fish or turtle. A pen for slaves awaiting shipment.

Crawling Off. Working off a lee shore by slow degrees.

Crazy. Shattered; rickety.

Creak. The noise made by a sheave when a heavy strain is brought upon it; also, the noise made by masts, ladders, and bulkheads when rolling heavily.

Crear. A kind of Scotch lighter.

Creek. A narrow inlet of the sea; it differs from a cove in being narrower, deeper, and longer. A brook or small river.

Creel, or Crue. See Kreel.

Creep. To drag an anchor or cable.

Creeper. A small grapnel used in searching for objects at the bottom of a harbor.

Creighton, Johnston B., Commodore U.S.N. Born in Rhode Island. Appointed from Rhode Island, February 10, 1838; attached to sloop-of-war "Levant," frigate "Constellation," sloop-of-war "Natchez," and frigate "Macedonian," in West Indies, 1840; frigate "Columbia," Brazil Squadron, 1843.

Promoted to passed midshipman, May 20, 1844; brig "Truxtun," coast of Africa, 1844–46; sloop "Dale," Pacific Squadron, 1846–47; storeship "Lexington," Pacific Squadron, 1848–50; steamer "Michigan," on the lakes, 1850–52; frigate "Cumberland," Mediterranean Squadron, 1852–55.

Commissioned as lieutenant, October 9, 1853; navy-yard, Boston, 1856–58; steam-frigate "Roanoke," Home Squadron, 1859–60; commanding steamer "Ottawa," South Atlantic Blockading Squadron, 1862.

Commissioned as commander, September 20, 1862; special duty, 1863; commanding steamer "Mahaska," South Atlantic Blockading Squadron, 1863–64; from August 8 to 21, 1863, bombarding Forts Wagner and Gregg, Morris Island, S. C., while in command of the "Mahaska"; commanding the steamer "Mingo," South Atlantic Blockading Squadron, 1864–65; took possession of Georgetown, S. C., and endeavored to communicate with General Sherman,—held it until relieved by army; ordnance duty, New York, 1866–67; commanding steam-sloop "Oneida," Asiatic Squadron, 1867–69.

Commissioned as captain, November 26, 1868; special duty, New York, 1870-71; commanding "Guerriere," European Squadron, 1871–72; member Board of Examiners, 1873–74.

Commissioned as commodore, November 9, 1874; commandant navy-yard, Norfolk, Va., 1876–79.

Creng. See Crang.

Crengle, or Crenkle. See Cringle.

Creole. One born within the tropics. One born in America or the West Indies of European ancestors.

Crepusculum. A circle parallel to and about 18° below the horizon; during twilight the sun is above this circle and below the horizon. Twilight.

Crespie. A term for a small whale or grampus.

Cresset. A beacon light on a watch-tower.

Crest. The summit of a wave.

Crew. The men who man a ship, boat, or gun. The word crew in law includes every person attached to a ship; when it is intended to exclude the officers the context shows it. The term is also applied to certain gangs of men on board ship; as, the carpenter's crew, gunner's crew, etc., but they are generally called *gangs*.

Crib. A small berth. A small raft. A structure of logs filled with stones, etc., and used as a dam, pier, ice-breaker, etc.

Crick. A small jack-screw.

Crimp. A term applied to a man who decoys seamen, plies them with liquor, induces them to sign articles while intoxicated, and presents extortionate claims for money advanced, board- and lodging-money, etc.

Cringle. An eye or grommet in the head, leech, or clew of a sail. It is generally worked around a metal thimble, and serves as a convenient means of attaching the bowline-bridles, earings, etc., to the sail.

Croaker. A grumbler; one who habitually forebodes evil; an alarmist. A tropical fish which makes a peculiar noise.

Croaky. A term applied to a plank when it curves much in a short length.

Crochert. An ancient hagbut or hand-cannon.

Crocodile. A reptile of the genus *Crocodilus*. It attains a length of 18 feet, and is found in Africa, Asia, and America. The American crocodile is properly an alligator. The men who served with Lord Keith in Egypt were called crocodiles.

Crocodile Tears. False tears; hypocritical sorrow. A term derived from the tales of travelers, who represented the crocodile as shedding tears over its prey.

Cronstadt. A seaport town of Russia, 20 miles W. of St. Petersburg, on the long, flat, and arid island of Kotlin, near the eastern extremity of the Gulf of Finland. Lat. 59° 59′ 42″ N.; lon. 29° 46′ 30″ E. The town is on the southeastern extremity of the island, opposite the mouth of the Neva, and is strongly fortified on all sides. It is intersected by two canals, which have their sides of granite, and are both deep and wide enough to admit the largest vessels. The one is used as a repairing-dock and the other for commercial purposes. Between the two canals stands a handsome palace, built by Prince Mentchikof, now occupied as a naval school, and attended by 300 pupils. The other public buildings deserving of notice are the marine hospital, the churches, the British seamen's hospital, the exchange, custom-house, admiralty, arsenal, barracks, cannon-foundry, etc., and the small palace in which Peter the Great resided. Pop. 48,000.

Crook. A crooked timber. A *natural crook*

is formed by the trunk of a tree and its branch, or by a large branch and a smaller one.

Crooked-catch. An iron implement bent in the form of the letter S.

Crooner. The gray gurnard (*Trigla gurnardus*), so called on account of the creaking noise it makes after being taken.

Crosby, Peirce, Commodore U.S.N. Born in Delaware Co., Pa. Appointed midshipman from Pennsylvania, June 5, 1838; attached to line-of-battle ship "Ohio," from 1838 until the summer of 1841, while flag-ship in the Mediterranean; attached to receiving-vessel "Experiment," at Philadelphia; afterward attached to steamer "Mississippi," on her trial-trip with the "Missouri," from New York to Washington. In 1842, was attached to the frigate "Congress," and sailed with her from Portsmouth, N. H., to the Mediterranean; served in her six months; was then transferred to the sloop "Preble," and returned to the United States in the fall of 1843, and was then attached to the Naval School at Philadelphia.

Promoted to passed midshipman, May, 1844; coast survey from summer of 1844 to summer of 1846, when he was ordered to the sloop "Decatur," and served in her six months in the Gulf of Mexico, during the Mexican war; participated in the attack and capture of Tuspan and Tabasco. Was then transferred to the gunboat "Petrel," and served in her one year, until peace was declared in the summer of 1848; afterward was attached to the store-ship "Relief," in 1849, carrying supplies to the Mediterranean and Coast of Africa Squadron, until the summer of 1850; attached to Philadelphia Navy-Yard from fall of 1850 to 1852, inclusive, and then transferred to receiving-ship stationed at Philadelphia, until spring of 1853; became attached to the frigate "Sacramento," then fitting for sea at Norfolk; was soon detached from her and placed on waiting orders.

Commissioned as lieutenant, September 3, 1853; in the winter of 1853, was ordered to sloop "Germantown," and sailed in her in the spring of 1854, from Boston to the coast of Brazil, and returned to the United States in February, 1857; attached to receiving-ship at Philadelphia until the latter part of 1858; sailed in the sloop "Saratoga," in the fall of 1858, for the Gulf of Mexico, and with the exception of forty days on board the "Brooklyn," under Capt. (late Admiral) Farragut, served two years, and returned to the United States in the "Saratoga," in 1860; attached to the receiving-ship at Philadelphia from 1860 to the spring of 1861; in the spring and summer of 1861, served in Chesapeake Bay, keeping open communication between Annapolis and Havre de Grace, capturing and destroying rebel vessels in the bay, and cutting off rebel supplies and communications. In the summer of 1861, received orders, and was attached to the frigate "Cumberland"; was detailed for duty on shore at Fortress Monroe; transported the troops across Hampton Creek, on the night prior to the battle of Big Bethel, also transported them on their return after their unsuccessful attempt to take that place. Volunteered and took the steamer "Fannie" (a canal-boat), secured her boilers temporarily down to the deck with chains, and proceeded with her, in company with the squadron, to the attack on Forts Hatteras and Clarke, in order to have a light-draft vessel to operate in landing troops at that place; superintended the landing of troops, until the heavy surf swamped and broke up the boats and dashed them on the beach, when Lieut. Crosby took a ship's heavy launch and landed two more boat-loads of troops, until the sea became so heavy that it threw the launch upon the beach, dashing all the crew out of her on to the shore. After thus having landed three hundred men and officers, the squadron and transports, on account of the bad weather, stood off seaward, leaving the troops landed on the shore until the following day, when the squadron returned, opened fire, and captured the forts, which were garrisoned by over seven hundred men, who had been led to believe, by the display made by the troops landed, that their force was over two thousand strong. In this way the rebels were deceived, and our troops were saved from attack and probable capture, as nearly all the ammunition was wet, and the volunteer troops, being in a disorganized state, could not, in all probability, have successfully opposed double their number. Lieut. Crosby succeeded in getting a strong picket thrown across the point in front of the enemy's batteries, thus preventing their making a reconnoissance or ascertaining the actual force of the Union troops, when the squadron returned on the following day, and relieved them from their critical position. Was especially mentioned in Gen. Butler's official report of the expedition. Captured several schooners running the blockade, they not knowing the forts had surrendered.

In the fall, and shortly after the capture of these forts, was ordered to the command of the gunboat "Pembina," fitting out at New York; but was taken dangerously ill with typhoid fever, brought on by constant exposure, privations, and fatigue in the performance of his duties. In the winter of 1861, took command of the gunboat "Pinola," at Baltimore; took her to Washington, received her battery, and sailed for the Gulf Squadron, joining Admiral Farragut's command in the spring of 1862. While on his way to join the squadron, captured the schooner "Cora," loaded with cotton, and sent her North as a prize. Commanded the "Pinola" on the memorable night when she co-operated with the "Itasca" in breaking through the chain barrier across the Mississippi, at Forts Jackson and St. Philip. The "Itasca" successfully slipped the end of the cable on the opposite shore to Fort Jackson, and in so doing ran hard and fast aground, but through the skillful exertions of Commander Crosby, was rescued from her critical position, at about two o'clock in the morning. The "Pinola's" duty on this occasion was to blow up with torpedoes the vessels holding the chain barrier, and anchored directly under Fort Jackson's guns,—which was twice tried. The vessels were boarded, which immediately drew the fire of Fort Jackson; torpedoes were placed in the hold, also outside of the vessels, and everything carefully arranged; but owing to the mass of floating timber around the vessels, the strong current and dark night, the wires attached to the galvanic battery and torpedoes were broken just as the attempt was made to explode them. When the third attémpt was about being made, a boat arrived alongside, announcing the "Itasca"

ashore, and in want of the "Pinola's" assistance to get her afloat; the attempt to blow up the vessels was reluctantly given up for the time, to assist the "Itasca," and in going to her assistance again drew the fire of Fort Jackson. In the first attempt to pull the "Itasca" afloat, two hawsers broke, but succeeded with an 11-inch hawser the second time in pulling her off; and in doing this, the "Pinola" passed well up through the barrier under Fort St. Philip, far enough to prove that the road was clear, but owing to the heavy bombardment of the mortar-fleet, was not heard or seen.

Participated in the bombardment and passage of Forts Jackson and St. Philip, Chalmette batteries, and capture of New Orleans; also in the bombardment, passage, and re-passage of batteries at Vicksburg, and engagement with the rebel ironclad "Arkansas." Blockaded off Mobile in the fall of 1862; was ordered North to command the ironclad "Sangamon."

Was promoted to commander, September 3, 1862; detached from "Sangamon," and appointed fleet-captain, North Atlantic Squadron, under Rear-Admiral S. P. Lee; commanded an expedition up the York River, co-operating with Gen. Dix, in command of the army corps at the White House. In the winter of 1863, took command of the "Florida," destroyed two blockade-runners at Masonboro' Inlet, while attempting to run the blockade, just at the break of day, and in so doing drew the sharp fire of flying batteries on shore; was transferred to the command of the "Keystone State" in 1864; captured five blockade-runners while in command of her, and caused many others to throw overboard their cargoes in order to escape. Detached from "Keystone State," and ordered to the "Muscoota"; detached from the "Muscoota," and ordered to the "Metacomet," 1864–65; blockaded off Galveston, Texas, and commanded her in the attack on Mobile. Planned and directed the construction of torpedo-nets, and spread them from shore to shore of the Blakely River, which caught all the floating torpedoes sent down to destroy the vessel; also planned torpedo drag-nets, superintended the removal of one hundred and forty torpedoes, and successfully cleared the track so as to allow the squadron to pass up safely to the city of Mobile. Occupied Forts Huger and Tracy on the night of the evacuation by the rebel forces; was especially commended by Admiral Thatcher in his official report of the naval operations at that port; was detached from the "Metacomet," on her return to Philadelphia, in August, 1865, at the close of the war. In September, 1865, received orders to command the "Shamokin"; sailed in her for the coast of Brazil, where he remained until 1868.

Promoted to captain, May 27, 1868, and detached, returning to the United States by the mail-steamer. While in command of the "Shamokin" conveyed Minister Washburn to Paraguay. At Norfolk Navy-Yard as inspector of ordnance, 1869–70; navy-yard, Philadelphia, 1871–72; navy-yard, Washington, 1872–74.

Commissioned as commodore, October 3, 1874; commanding naval station, League Island, since 1878.

Cross. See HAWSE.

Cross-bar Shot. A projectile specially adapted for cutting the enemy's rigging; when folded it presented a complete bar or shot, but when it left the gun it expanded, forming a cross with a quarter ball at the end of each arm.

Cross-beam. A beam extending across the ship from side to side.

Cross-bearings. See BEARING.

Cross-fish. A name for the star-fish, from the Norwegian *kors-fisk.* Also, the *Uraster rubens.*

Cross-head. A strong beam of iron or steel, confined to rectilinear motion by slides or by a "parallel motion," to which the outer ends of piston-rods are firmly secured. In back-acting engines with single piston-rods it is provided with eyes, to which side rods are rigidly secured, and which extend outside of the cranks to corresponding eyes on a second cross-head running in slides, and on which is the connecting-rod journal. When two cross-heads are used they are called, respectively, the "piston-rod cross-head" and "connecting-rod cross-head." In direct-acting, beam-, or side-lever engines, the piston-rod cross-head is provided with journals for the connecting-rod, links, or side rods, as the case may be.

Cross-jack (Pro. *crojek*). The sail which, in the merchant service, is bent to the *cross-jack yard*, or lower yard on the mizzen-mast. In the navy a sail is never bent to this yard. The *cross-jack braces* are the braces by which the cross-jack yard is moved about, but the term also includes all the braces on the mizzen.

Cross-sea A sea which does not set in the direction toward which the wind is blowing. During a cyclone the wind changes rapidly, and each change in the wind tends to produce a change in the set of the sea, so that in a part of the sea which has experienced all the changes of one of these gales, the sea runs up in pyramids, sending the tops of the waves up into the air.

Cross-spalls. Pieces of plank that keep the frame to the proper breadth until the beams are in.

Cross-swell. The same as a cross-sea, except that the waves undulate without breaking violently.

Cross-tail. In side-lever engines, a strong beam of iron or steel to which one end of the connecting-rod and of the links connecting with the end-centres of the beams are rigidly attached.

Cross-timbers. The pieces of timber bolted athwartships to the bitts, for taking turns with the cable or belaying ropes to. Also, a rack with belaying-pins through it extending over the windlass of a merchant ship.

Cross-trees. Timbers athwart the lower and topmast trestle-trees to support the frame of the top and give spread to the topgallant shrouds. Each athwartship timber is called a *horn.*

Cross-wires. Spider-wires placed in the focus of the object-glass of an astronomical telescope. In this position they become visible by stopping pencils of rays, which there converge to points. In this focus, also, the image of a heavenly body as it passes over the field of view is simultaneously seen, and its place is noted by referring it to the cross-wires.

Crotch. See CRUTCH.

Crotchet. A crotch. Also, an old spelling of *cross-jack.*

Crow, or Crow-bar. An iron lever with a sharp point or edge for moving heavy weights.

Crowd. *To crowd sail* is to carry an extraordinary press of canvas; as, in chasing.

Crow-foot. A combination of small lines rove through an euphroe and secured to the back-bone of an awning. To this is hooked the *crow-foot halliards*, by which the midship part of an awning is kept from sagging down.

Crown. The round up of the deck from a straight or level line. The decks of nearly all ships are higher in the centre than at the sides, in order to shed the water. An English silver coin of the value of five shillings,—about $1.20. The external arch of an anchor, upon which it falls when let go perpendicularly. The most violent part of a gale. *To crown* a knot is to finish it up by laying the ends of the strands over and under each other, so that they will bind and keep the knot from unlaying. To *double crown* a knot is to follow the parts of the single crown a second time with the ends of the strands.

Crown-rope. A line used in the cable-tiers to keep the fakes in place.

Crow-purse. The egg-capsule of a skate.

Crow-shell. A fresh-water mussel.

Crow's Nest. A perch for the look-out at the mast-head; used particularly in whalers.

Croy. An inclosure for catching fish. When the tide flows the fishes swim over the wattles, but are left by the ebbing of the water.

Crue. See Kreel.

Crue-herring. The shad (*Clupea alosa*).

Cruer. See Crare.

Cruise. To sail on the ocean; as, in search of an enemy, for the protection of others, or in quest of pleasure or plunder. A voyage made in various directions in search of an enemy, etc.

Cruiser. Any armed vessel that cruises. Formerly, a small fast vessel to harass the enemy and protect the commerce of its own country.

Cruive. An inclosed space in a dam or weir for taking salmon.

Crummy. Fleshy or corpulent.

Crupper. An old name for the train-tackle bolt in a gun-carriage.

Crupper-chain. A chain for confining the jib-boom to the bowsprit.

Crusado. See Cruzado.

Crutch. A stanchion of wood or iron, whose upper part is forked for receiving and supporting a mast, yard, boom, etc.

Crux (Lat. "The Cross"). A constellation which, with Centaurus, constitutes a bright group in the southern hemisphere, in a line with Arcturus and Spica.

Cruzado. See Money.

Cubbridge Heads. The old bulkheads of the forecastle and half-decks, wherein were placed the "murderers," or guns for clearing the decks when boarded.

Cub-house, or Cubboos. See Caboose.

Cubiculatæ. Roman ships furnished with cabins.

Cuckold's-knot, or Cuckold's-neck. A hitch by which a rope is secured to a spar,—the two parts of the rope cross each other, and are seized together.

Cudbear. See Corkir.

Cudberduce. The cuthbert-duck, a bird of the Farn Isles, off Northumberland.

Cuddie, or Cuddin. One of the many names for the coal-fish.

Cudding. A name for the char.

Cuddy. A small cabin. A sort of cabin or cook-room, generally in the fore part, but sometimes near the stern, of barges and lighters.

Cuddy-legs. A name for large herrings.

Culagium. A law-term for the laying up of a ship in the dock for repairs.

Culch. Stone, shells, etc. See Oyster-bed.

Cullock. A species of bivalved mollusk (*Tellina rhomboides*).

Culminate (Lat. *culmen*, the top, ridge). The heavenly bodies in their diurnal revolution, when they attain their greatest and their least altitude above the horizon, are said to culminate; this happens when they cross the meridian. All those bodies which are within the circle of perpetual apparition visibly come to the meridian twice in every diurnal revolution, once *above* and once *below* the elevated pole. These are respectively called their *Upper* and *Lower Culminations.* Other bodies which show themselves culminate but once.

Culring. An old corruption of *culverin.*

Culverin. An ancient cannon, so called because it was ornamented with serpents (*Coluber*, a snake).

Culver-tailed. Dove-tailed.

Culward. The archaic term for a coward.

Cumulo-cirro-stratus. The nimbus, or rain-cloud. See Cloud.

Cumulo-stratus. The twain-cloud, so called because the cumulus blends with the stratus. See Cloud.

Cumulus. The day- or summer-cloud. See Cloud.

Cund. To give notice of the direction of a shoal of fish.

Cunn. See Conn.

Cunneng. A name for the lamprey.

Cup. A solid piece of cast iron in which the spindle of a capstan works.

Cuppy. A defect sometimes found in timber, where a portion of the heart has separated from the outside; probably caused by lightning or severe frosts.

Cur. A name for the bull-head.

Cur-fish. A small kind of dog-fish.

Curl-cloud. See Cloud.

Curlew. A coast bird with a long, curved bill (*Numenius arquatus*).

Currach. A skiff formerly used on the Scottish coasts.

Curra-curra. A peculiarly fast boat in the Malay Islands.

Currents. The surface of the ocean is furrowed and its depths traversed by streams of running water, forming a system of circulation as complete, more regular, but intimately connected with, the currents of the air. These currents are due to two primary causes,—the action of the winds and the heat of the sun. As water is a non-conductor, when a portion of the surface of the sea is heated, that part only becoming subject to the evaporative effects of the sun becomes heavier and sinks, its place being supplied by colder currents from the bottom or from other localities. But these vertical currents are modified by the action of the prevailing winds and the motion of the earth on its axis. The permanent winds, blowing in a westerly direction,

where the water is hottest, at the tropics, impel the waters westward in their course. Were it not for the continents we should thus have a westerly current around the globe at the equator. But this westerly current, crossing the two oceans, strikes the continents, turns to the northward, until it is impelled in an easterly direction by the centrifugal force generated by the revolution of the earth on its axis, and flows into itself again, being divided or modified as it impinges on continents or islands in its track. The spaces thus vacated by the hotter waters of the globe are filled partly by a compensating system of cold surface currents, but principally by under-currents of cold water flowing from the frozen regions of the globe. The influence of the superficial currents is not felt at any great depth below the surface, extending only from 300 to 500 fathoms.

Besides these primary causes of the general currents of the globe, they are also caused by the tide, by storms, and by the gradual or rapid fall of streams of water from higher portions of the earth, and rivers sometimes prolong their action far into the waters fed by them.

The great currents of the ocean are of the utmost importance, modifying the climates of the globe, aiding navigation in the great commercial waters, and distributing the animals of warmer seas over colder regions; and the navigator is particularly interested in them.

Currents exist all over the ocean, very slight in some places and strong in others. We may divide them into great currents, lesser currents, tidal currents, storm currents, and river currents. The former only need claim our attention to any extent. The warm currents of the two oceans are divided into many, all, however, offshoots or parts of the same general streams. In the Atlantic, the northeast trade-wind blows the warm waters of the tropics into the heated basins of the Caribbean Sea and the Gulf of Mexico. These tepid waters, pouring from the narrow straits of Florida, form the mighty Gulf Stream. Similarly, in the Pacific, the waters of the equatorial region form the Kuro Siwo, or Japan stream. These mighty rivers of heated water resemble each other in their prominent features. The Gulf Stream is from forty to several hundreds of miles wide, is a deep indigo blue in color, is from ten to twenty degrees hotter than the surrounding waters of the ocean, is swifter at its commencement and in the centre, is traversed by various currents of cold water, throws off streams of hot water from its banks, that recurve in an opposite direction to it. Its velocity is from one to five miles an hour, and is less in its northerly portions by reason of friction and the slower rotation of those portions of the earth. Its banks are well defined, ripples being often seen, and sudden changes of temperature announcing it. They vary with the season, following the sun in its course, and with the prevailing winds. Its temperature varies from 62° in winter to 82° in summer. Its waters teem with animal life, and its banks are enshrouded in clouds, fogs, and storms. On reaching the eastern basin of the Atlantic it divides into two branches, one flowing south, past the shores of Spain and North Africa, until, in the region of Cape Verde, it again divides, part flowing west to become again a portion of the main stream, and a branch going to the southward along the African coast, under the name of the Guinea current. The other branch of the main stream flows to the northeastward, tempering the winters of Norway.

The southeast trade-wind also forms its current, which is called the Equatorial current. Flowing to the northwestward, across the ocean, it divides on reaching the continent of South America, one branch flowing into the Caribbean Sea and feeding the Gulf Stream, and the other, turning to the southwestward, called the Brazil current, loses itself in the cold currents of the Southern Ocean. These warm currents are partly balanced by the cold currents, the Arctic and the Cape Horn currents, both bearing icebergs from the frozen regions. The Arctic current, flowing from the eastward of Greenland, is joined by the Hudson Bay current, and united they form the Labrador current, flowing down inside the Gulf Stream along the American coast until it dips under the Gulf Stream and is lost in the equatorial waters. The Cape Horn current is a branch of the Antarctic drift.

The current circulation of the Pacific resembles that of the Atlantic. A north equatorial drift-current is here impelled to the westward by the northeast trade-winds, a Gulf Stream formed in the Kuro Siwo, furrowed by hot and cold streams, as the Gulf Stream, like it hotter by several degrees than the surrounding ocean, and diminishing in velocity to the eastward. Its color is dark blue, and it is joined during certain seasons by the monsoon drift-currents of the China Sea. About the latitude of 40° N., it divides into two branches, one flowing to the northward, warming the bleak Kamschatkan coast, and passing through Behring Straits, losing itself in the Arctic Ocean. The other flows to the eastward, then south down the American coast, and again is caught by the trade-wind, and blown across the ocean, a part of it, however, still flowing down the Mexican coast as far as the equator. The southeast trade also here causes its equatorial current, and this, flowing across the Pacific, throws off two branches about 178° W., one curving to the northward and eastward, and losing itself in the counter-current, the other turning to the southward and eastward until it meets with a cold current, and the main stream loses itself among the islands. A cold current flows from the Arctic regions, through Behring's Straits, and down the Asiatic coast. The Southern Pacific has also a cold current, Humboldt's, or the Penwan, flowing to the northward along the South American coast, part of it entering into the trade drift, and a part of it flowing as far north as the equator.

The currents of the Indian Ocean are so affected by the prevailing monsoon as not to be constant in direction during the whole year. There is, however, one warm current—the Agulhas current—which flows from the equator in a southwesterly direction, between the coast of Africa and Madagascar. It throws off a branch to the eastward, soon lost in the cold current, and its main body passes around the Cape of Good Hope into the Atlantic, joining the southeast trade drifts there.

The warm currents thus impelled from equatorial regions are fed by streams of cold water, welling up from Antarctic regions. The great

Antarctic drift-current, coming from the frozen regions near the south pole, are deflected to the eastward by the westerly winds that here blow around the globe. The offshoots of this great current, known as Humboldt's, and the Cape Horn current, have been alluded to. Besides these, the great southern connecting current flows on past the southern point of Africa and through the Indian Ocean, until it arrives on the west coast of Australia. It there divides into two branches, one flowing to the northward, a part of it working through Macassar Straits, and forming a great counter-current across the Pacific Ocean, and a part curving to the westward across the Indian Ocean, joining the warm Agulhas current at Mozambique. The southern branch is the Southern Australian current, which, after passing south of that great continent, throws off an offshoot—the East Australian current—to the northeastward, and, continuing east with its parent stream,—the Antarctic drift,—it curves westward again, recrossing the Pacific about the tropic of Capricorn, and is lost in tropical waters.

In the calm spaces formed by these currents, in bays and inlets near the coast, in interior lakes, etc., there are often currents, depending on wind or tide, or other cause. The storms, whether circular or translatory, carry with them a storm wave and appreciable current. The tidal wave, in its passage about the earth, carries a powerful current with it. The great rivers of the earth, as they emerge from their banks, carry their discolored streams far into the waters. The Amazon, La Plata, and other great rivers make their currents felt hundreds of miles from the coast. The investigation of currents has been greatly forwarded by the labors of Maury, by the Coast Survey, and deep-sea sounding vessels, and by the recent "Challenger" voyage of exploration of sea depths. Much remains yet to be known, and the great current charts need to be revised, added to, and corrected constantly.

The exact determination and measurement of a current are important problems in scientific navigation. It is somewhat difficult to determine the velocity and direction of a current in mid-ocean, from having no fixed point as a basis. The usual method employed by navigators, sufficiently exact for their purpose, is to compare the positions of the ship from time to time, as from one noon to the other, obtained by measurement of her speed, with those found by astronomical means, or, as sailors say, position by dead-reckoning with position by observation. If the measuring instrument were not affected by the current this would give the exact force of the current during the interval, but the logship is affected by the current, and hence this does not give the exact current. The following example illustrates this method of finding the current:

Lat., dead reckoning...	51° N.	Lon., dead reckoning..	76° W.
Lat., by obs. of sun.....	49° N.	Lon., observation	75° W.
Difference............	2° N.	Difference............	1° W.

But this sixty minutes of longitude represents, in lat. 50°, 38.6′. With this *departure*, and the difference of latitude, we find the difference due to currents, from tables, to be 126′, and its course to be S. 18° E. This is the *set* of the current, and the distance 126′ is its *drift*. The set is always in the direction of the true position from the estimated. Hence the set and drift of the current are the course and distance corresponding to the difference of latitude and departure between the two positions. To find the effect of a current upon a course and rate of speed, a reverse operation is performed. When a course is to be laid down for a port, the current, if known, must be allowed for. This is usually done graphically on a chart. But it may be done by calculation. The correction is found by its sine, which is equal to the rate of the current x by the difference between its set and the course, divided by the distance to be sailed, or $\sin x = \frac{r \sin (c - s)}{d}$. Then the correct course would be $C = c - x$. In beating to windward, the current is also to be considered, that tack on which it helps being the best, or "long tack." The currents of the depths of the ocean are less easily obtained. The temperatures obtained in sounding are sometimes a guide to the currents, and they may be measured by a fan attached to a buoy, when a fixed point from which to observe the course of the buoy can be obtained; but this is rarely the case, and such currents will long remain but partially known.—*F. S. Bassett, Lieutenant U.S.N.*

Currier. A small musketoon mounted on a swivel.

Cursa. The star β *Eridani.*

Curtall, or **Curtald.** An ancient piece of naval ordnance.

Curtle-ax. An old name for a cutlass.

Cuseforne. A long, open whale-boat of Japan.

Cushing, W. B., Commander U.S.N. William B. Cushing was born in Delafield, Wis., November 4, 1842; entered the Naval Academy at Annapolis, Md., September 25, 1857; resigned March 23, 1861, and as soon as possible thereafter entered the naval service afloat as an acting master's mate. His disposition and temperament would not permit him to remain at a naval school in time of war; he would not have been able to give a single thought to theoretical study.

In the following October he was restored to his rank as midshipman. March 27 he was detached from the "Cambridge" sick, and granted one month's leave. The following May he was ordered to the "Minnesota," and was promoted to the rank of lieutenant from the 16th of July, with a large number of young officers, made necessary to supply the demands of the service growing out of the civil war.

Henceforth, for a period of nearly three years, his career was singularly conspicuous in deeds of daring, in a service where a lack of gallantry would have brought disgrace.

When in command of a small steamer engaged in blockading, he sought opportunities of visiting the inland waters of the enemy in his boats, usually after night, and would sometimes lie concealed during the following day, always having in view some definite object, whether commensurate with the risks involved or otherwise. At other times in narrow waters, in the vessel he commanded, he would find himself fiercely engaged with the field-batteries of the enemy.

When blockading the coast near New Topsail Inlet he discovered a schooner within, and made a reconnoissance in his boats, but soon found himself under fire of the enemy's field-pieces and small-arms, in the hands of a considerable force guarding the inlet. He retired, but determined

to destroy the schooner lying some miles from the guarded point of entrance.

Persons familiar with inlets in marshy countries know that usually they are very tortuous, and often lead for miles along or near sand-spits which separate the channels from the ocean. Such was the configuration of New Topsail Inlet. Late in the evening, August 22, 1863, Lieut. Cushing anchored the "Shokokon" close to the beach abreast the schooner, and several miles distant from the entrance to the inlet. He sent two boats with crews on shore, the larger one to act as a support. The men hauled the smaller boat across the sand beach and launched it in the stream. Acting Ensign James C. Coney was sent in this boat with a force of six men to destroy the schooner. They pulled along until within a short distance from the vessel of the enemy, where they landed and sent a man to reconnoitre, who brought the information that some twenty men with a small piece of artillery were guarding the vessel. A charge was made, the enemy routed, ten prisoners, one howitzer, and eighteen small-arms captured; the schooner and adjacent salt-works were destroyed, and the expedition rejoined the vessel without loss.

In the winter of 1864, when blockading the Cape Fear River, Cushing determined to pay a visit to Smithville in a boat having a crew of but six men. In entering the river he had to pass Fort Caswell, mounting heavy guns, and at Smithville, his destined point, two miles above, he knew there was a battery of five guns and a considerable garrison. He landed one hundred yards above the battery, came into the village, and across the street into Gen. Hebert's house, a large building with a piazza; the hour was about 11 P.M. Major Hardeman and Capt. Kelly, of the general's staff, were down-stairs and about retiring, when the former hearing footsteps on the piazza and supposing his servant was there, threw up a window, when a navy pistol was thrust in his face and a demand made to surrender. He instantly pushed the pistol aside, and escaped through a back-door, calling upon Kelly, his companion, to follow, as the enemy were upon them. The latter failed to comprehend, and was taken prisoner and carried off by Cushing, who embarked at once, knowing that an alarm would immediately be given. In speaking of this occurrence, Cushing said that it was a beautiful, bright moonlight night, and that he counted upon a lack of vigilance of the enemy from that fact. The soldiers were quartered in the immediate vicinity where his prisoner was captured.

An army officer who was at the capture of Newbern mentioned that Cushing in command of navy howitzers passed along with his sailors, aided by soldiers, dragging the pieces. In landing in the marsh Cushing had lost his shoes and in the bushes his hat. Pressing on bareheaded and barefooted, he encountered the servant of Capt. Johnson, of the army, who had a pair of spare boots slung over his shoulder. Cushing asked the servant the name of the owner of the boots, and said, "Tell the captain that Lieut. Cushing, of the navy, was barefooted and has borrowed them for the day," and in spite of the remonstrances of the servant put the boots on in haste and pursued his way.

In the destruction of the plated ram "Albemarle" we see Cushing in a true heroic light. The press correspondents had for a month or more apprised the public and the enemy that Cushing was on his way from the North with a torpedo-boat to blow up the "Albemarle." No method could have been taken that would seem more efficacious to render her destruction impossible. The enemy was apprised of the arrival of the torpedo-boat in the adjacent waters; the "Albemarle" was secured to a wharf at Plymouth; a cordon of logs was placed around her at a distance of about thirty feet; a company of soldiers with small-arms and howitzers were on the wharf to defend her, and her crew on board to make use of her guns. The enemy was vigilant and Cushing's approach was discovered. Yet he pushed forward amidst a shower of bullets and the fire from the howitzers stationed on the wharf, forced his way in over the cordon of logs, lowered his torpedo and blew the vessel up at the very instant when a shell from one of the heavy guns of the "Albemarle" struck the torpedo-boat and she went down swamped by the column of water and spray, which rose high in the air when the torpedo exploded.

For this act of heroism Cushing was advanced to the grade of lieutenant-commander.

His entire career was filled with daring, cleverly planned and admirably executed; hence his unvarying success in what he undertook.

Cushing's life in war was active and heroic in the extreme; in peace he seemed to suffer as it were from inanity, or, more properly speaking, from the apparent lack or absence of a strong purpose.

After the close of the war he was for some two years the executive-officer of the "Lancaster," a position which required close attention and study to fulfill its duties in the best manner.

Afterwards he served three years in command of the "Maumee," on the Asiatic station. He was promoted in regular order of vacancies to commander January 31, 1872, and soon after was ordered to the command of the "Wyoming," on the home station, and was relieved at the end of a year, the vessel being put out of commission.

In the spring of 1874 he was ordered to the Washington Navy-Yard, and the following August he was detached at his request. He then seemed in impaired health, and expressed a desire to go South; after the lapse of a few days he showed symptoms of insanity and was removed to the government hospital, where he died December 17, 1874, at the age of 32 years and 13 days.—*Daniel Ammen*, *Rear-Admiral U.S.N.*

Cushion. A term applied when the exhaust-valve of a steam-engine closes before the piston has reached the end of its stroke, thus compressing the remaining steam. It causes the engine to run smoothly, and its resistance to the piston is compensated by the compressed steam filling the clearance and port, which would otherwise have to be filled with fresh steam from the boilers.

Cusk. A fine table-fish taken in cod-schools.

Cusp. A projecting point or horn.

Custom. Long-established practice or usage, having the force of law by reason of the general consent which it implies. The *customs of the*

service constitute the unwritten part of the law military.

Customs. Duties or imposts laid on the importation or exportation of certain commodities. Such duties were levied in ancient times, and have continued to form an important part of the revenue of most modern states. (See TARIFF.)

CUSTOMS, COLLECTION OF. The collection of custom duties in the United States is part of the business of the Treasury Department, and is confided to a bureau of that department, presided over by a Commissioner of Customs. To this bureau pertain the examination of all questions arising under the tariff laws upon appeals from decisions of Collectors of customs involving the rates and amount of duties on imports; the consideration of cases involving errors in invoices and entries, refund and abatement of duties, drawback of customs, duties on articles manufactured in the United States out of imported material, and establishing the rates of drawback; also the consideration of all questions arising upon the construction of the customs laws, and the general regulations thereunder in regard to the entry, appraisal, and delivery of merchandise, and payment of duties thereon. It also conducts correspondence with consular officers, through the Department of State, in regard to dutiable values, invoices, etc. It exercises supervision over Appraisers in securing uniformity of valuation of dutiable merchandise at the various ports, and in respect of compromises in customs cases. It has also supervision of the seal-fisheries in Alaska, and such other matters in that Territory as are placed by law in charge of the Secretary of the Treasury. There are 131 collection districts and ports, to the more important of which, viz., Boston, New York, Philadelphia, Baltimore, New Orleans, and San Francisco, a Collector, a Naval Officer, and a Surveyor are appointed. Of the lesser districts and ports some have a Collector only; some a Surveyor only. At each of the ports having the three officers it is the duty of the Collector to receive all reports, manifests, and documents to be made or exhibited on the entry of any ship or vessel, according to law and regulations; to record in books, to be kept for that purpose, all manifests; to receive the entries of all ships or vessels, and of the goods, wares, and merchandise imported in them; to estimate, together with the Naval Officer, the amount of the dues payable thereupon, indorsing such amount upon the respective entries; to receive all moneys paid for duties, and take all bonds for securing the payment thereof; to grant all permits for the unlading and delivery of goods; to employ, with the approval of the Secretary of the Treasury, proper persons as weighers, gaugers, measurers, and inspectors at the several ports within his district; to provide, with the like approval, at the public expense, store-houses for the safe-keeping of goods, and such scales, weights, and measures as may be necessary. At ports to which a Collector and Surveyor only are appointed, the Collector alone executes all the duties in which the co-operation of the Naval Officer is requisite at the ports where a Naval Officer is appointed. And he acts in like manner in case of the disability or death of the Naval Officer until a successor is appointed, unless there is a deputy duly authorized, under the hand and seal of the Naval Officer, who in that case continues to act until an appointment is made. At ports to which a Collector only is appointed, the Collector alone executes all the duties in which the co-operation of the Naval Officer is requisite at ports where a Naval Officer is appointed; and he also, as far as may be, performs all the duties prescribed for Surveyors at ports where Surveyors are authorized.

At ports to which there are appointed a Collector, a Naval Officer, and a Surveyor, it is the duty of the Naval Officer to receive copies of all manifests and entries; to estimate, together with the Collector, the duties on all merchandise subject to duty, and no duties shall be received without such estimates; to keep a separate record of such estimates; to countersign all permits, clearances, certificates, debentures, and other documents to be granted by the Collector; to examine the Collector's abstracts of duties and other accounts of receipts, bonds, and expenditures, and certify the same if found correct.

At ports to which there are appointed a Collector, Naval Officer, and Surveyor, it is the duty of the Surveyor, who is in all cases subject to the direction of the Collector, to superintend and direct all inspectors, weighers, measurers, and gaugers within his port; to report once in every week the name or names of all inspectors, weighers, gaugers, or measurers who are absent from or neglect to do their duty; to visit or inspect the vessels which arrive in his port, and make a return in writing every morning to the Collector of all vessels which have arrived from foreign ports during the preceding day, specifying the names and denominations of the vessels, the masters' names, from whence arrived, whether laden or in ballast, to what nation belonging, and, if American vessels, whether the masters thereof have or have not complied with the law, in having the required number of manifests of the cargo on board, agreeing in substance with the provisions of the law; to put on board each of such vessels one or more inspectors immediately after their arrival in his port; to ascertain the proof, quantities, and kind of distilled spirits imported, rating such spirits according to their respective degrees of proof, as defined by the laws imposing duties on spirits; to examine whether the goods imported in any vessel, and the deliveries thereof agreeably to the inspectors' returns, correspond with the permits for the landing of the same; and if any error or disagreement appears, to report the same to the Collector, and to the Naval Officer, if any; to superintend the lading for exportation of all goods entered for the benefit of any drawback, bounty, or allowance, and examine and report whether the kind, quantity, and quality of the goods so laden on board any vessel for exportation correspond with the entries and permits granted therefor; to examine, and from time to time, and particularly on the first Mondays of January and July in each year, try the weights, measures, and other instruments used in ascertaining the duties on imports, with standards to be provided by each Collector at the public expense for that purpose; and where disagreements or errors are discovered, to report the same to the Collector; and to obey and execute such directions as he may receive for correcting the same, agreeably to the standards.

At ports to which Collectors and Surveyors only are appointed, the Surveyor performs all the duties enjoined upon Surveyors by the preceding clauses, and also receives and records the copies of all manifests transmitted to him by the Collector; records all permits granted by the Collector, distinguishing the gauge, weight, measures, and quality of goods specified therein; and takes care that no goods be unladen or delivered from any ship or vessel without a proper permit for that purpose.

Surveyors, at certain ports to which no Collector or Naval Officer is appointed, perform all the duties which would be required of a Collector.

Every Collector, Naval Officer, and Surveyor is authorized, with the approval of the Secretary of the Treasury, in case of his sickness or unavoidable absence, to exercise and perform his functions, powers, and duties by deputy duly constituted under his hand and seal.

Cut. To separate or divide. Shape; style; fashion; as, the cut of a sail. A passage, channel, or canal. *A short cut*, a cross route, which shortens the distance to be sailed. *To cut*, to adjust or turn around a spar, cask, etc.; also, to strike with the edge of a sword. *To cut stick*, to make off clandestinely. *To cut and run*, to make off suddenly and rapidly; from the necessity of cutting the cable when getting under way in an emergency. *To cut off*, to intercept a vessel or vessels. *To cut out*, to seize and remove from under the guns of an enemy; as, a ship from a convoy, or a vessel from a harbor. (See CUTTING OUT.) *To cut down*, to take a deck off a vessel, thus converting a line-of-battle ship into a frigate, a frigate into a sloop, etc.; also, to cut the laniard of a hammock and let the occupant down to the deck. A ship *cuts a feather* when her bow is so sharp as to make the spray feather in cleaving the water.

CUT-OFF. A term applied when the admission of steam to a cylinder is stopped before the piston has completed its stroke, the remaining portion of the stroke being accomplished by the expansive force of the steam. The term is also applied to the various mechanical devices for effecting such stoppage, such as the Stephenson link combined with the "lap" of a plain slide-valve, "tripping" a counter-weighted valve or poppet-valve by means of cams, springs, and catches, and by independent cut-off valves. See EXPANSION OF STEAM.

CUT-OFF VALVE. A valve used for effecting a cut-off, which, with its mechanism, is independent of the main valves and their gear.

CUT OF THE JIB. The general appearance of a ship or person.

CUTTING-DOWN LINE. A curve bounding the inside of the timbers of the ship at the centre-line.

CUTTING OUT. The exploit of capturing and removing or destroying a vessel protected by the guns of a fort or fleet.

When a vessel is to be cut out from a convoy, a favorable opportunity is waited for, the vessel is boarded, and the crew confined; if able to do this without creating a noise or otherwise attracting the attention of the armed vessels, it is possible to remove the ship from the convoy and take her into port as a prize. When impossible to remove the vessel, her crew is sent into her boats, and she is fired.

When it has been determined to cut out a vessel at anchor, from under the guns of a fort or fleet, the boats are provided with essentials only, and extra men are carried if considered necessary. The crews are specially instructed in their various duties, some of them being provided with combustible material for setting the vessel on fire. The men are armed with cutlasses and revolvers, and some means of identification in the dark is decided upon.

Taking advantage of wind, weather, darkness, and the state of the tide, the oars are muffled, and the boats are rowed noiselessly towards their destination. If discovered, the boats make a dash for the vessel, the men are thrown on board, the enemy's crew is overpowered or driven below, and the vessel is fired in several places. If not discovered, the boats are rowed alongside quietly, and the vessel is boarded in silence, the hatches are guarded to keep the enemy's crew below, and the ship is fired, the boarding-party remaining by her until assured that the fire cannot be extinguished.

Cute. Sharp; crafty; cunning.

Cuth. A name for the coal-fish before it is fully grown.

Cutlass. The short, heavy sword supplied to the navy; called *cutlash* by Jack.

Cut-line. The space between the bilges of casks stowed chine and chine.

Cutt. An old horse-ferry boat.

Cutter, George F., Paymaster-General U.S.N. Entered the navy as captain's clerk to Commander John Percival, April 18, 1838, on board the sloop-of-war "Cyane," Mediterranean Squadron; discharged May 18, 1841.

Commissioned as purser, June 5, 1844; ordered to brig "Truxtun," African Squadron, June 18, 1844; detached December, 1845. Ordered to brig "Perry," West India Squadron, April 24, 1846; detached May 15, 1846, and ordered same day to brig "Truxtun," West India Squadron (Mexican war). Wrecked and taken prisoner, August, 1846; released on parole, September, 1846, and exchanged November, 1846. Ordered to receiving-ship "Franklin," navy-yard, Boston, December 4, 1846, and detached May 1, 1847. Ordered to sloop-of-war "Albany," West India Squadron, August 12, 1847 (Mexican war); detached September 11, 1850. Ordered to receiving-ship "Ohio," navy-yard, Boston, April 1, 1851; detached April 1, 1854. Ordered, April 25, 1854, to steamer "Massachusetts," Pacific Squadron; detached August, 1857. During the cruise was eighteen months in Puget Sound, Washington Territory, during the Indian war there. Ordered, October 7, 1857, to navy-yard, Portsmouth, N. H., and detached September 1, 1860, and ordered to the steamer "Richmond," flag-ship Mediterranean Squadron, September 10, 1860. When the Rebellion broke out the "Richmond" was ordered to the Mexican Gulf Squadron, and in her was present at the passage of the forts below New Orleans, capture of that city, the attack on Vicksburg, running the batteries, and the general operations on the Mississippi River, attack on the forts at entrance of Pensacola Harbor, and on blockade duty; detached from the "Richmond," October 20, 1862. Ordered North, and was ordered as fleet paymaster North Atlantic Squadron, but before taking charge of duty was detached, and

ordered, April 2, 1863, as fleet paymaster Eastern Gulf Squadron, flag-ship "San Jacinto"; detached December 1, 1863. Ordered North, and March 7, 1864, ordered as inspector in charge of stores, navy-yard, Boston; detached April 1, 1867. Ordered as purchasing paymaster, New York, June 24, 1867; detached September 2, 1867. Ordered, October 1, 1867, to flag-ship "Piscataqua," as fleet paymaster of Asiatic Squadron; detached July 23, 1869, and ordered home. January 1, 1870, ordered as inspector in charge of stores, navy-yard, Boston. Received commission as pay director March 3, 1871. Detached, as inspector, October 1, 1872, and ordered as paymaster of New York Navy-Yard; detached February 12, 1873, and ordered as purchasing and disbursing paymaster, New York; detached March 5, 1877, and appointed general inspector, Bureau of Provisions and Clothing; detached November 17, 1877, and appointed paymaster-general U. S. navy, Washington, D. C., where now on duty.

Cutter. A single-masted, sharp-built vessel, furnished generally with a running-in bowsprit, and carrying a fore-and-aft mainsail, gaff-topsail, stay-foresail, and jib. There is no jib-stay, the jib hoisting and hanging by the halliards alone. The name is derived from its fast sailing. The name cutter is also given to the small steamers in our revenue marine service. Pulling boats called cutters are the medium-sized boats supplied to the navy. They are square-sterned, double-banked, and pull 10 to 12 oars. See SAILS, BOAT'S.

CUTTER-BRIG. A square-rigged vessel with a jigger and a fore-and-aft mainsail.

CUTTER-STAY FASHION. A method of turning in dead-eyes, so called because originally used for the forestays of cutters. The end part of the shroud or stay is taken around the standing part and stopped back to its own part. This plan allows a sail to be hauled close down. The method is sometimes used for lower rigging; it presents a neat appearance, but is not so strong as the ordinary mode.

Cuttie. A name for the black guillemot (*Uria grille*).

Cuttle-fish. A common marine animal of the genus *Sepia* and class *Cephalopoda*. When in danger it ejects a black inky substance, which discolors the water for some distance; hence sometimes called the *ink-fish*.

CUTTLE-BONE. The oval, internal, calcareous shell of the cuttle-fish.

Cutty. A short-stemmed pipe. A loose woman.

Cut-water. That part of a vessel forward of the stem; it divides the column of water through which the vessel passes.

Cycle. A periodical space of time marked by the recurrence of something peculiar. *The cycle of the sun*, or *solar cycle*, is a period of 28 years, after which the same days of the week recur on the same days of the year. *The cycle of the moon*, or *Metonic cycle*, is a period of 19 solar years, after which the new and full moon fall on the same day of the year that they did 19 years before. *The cycle of indiction*, or *Roman indiction*, a period of 15 years, employed in Roman and ecclesiastical chronology. *Calippus cycle*, a period of 76 years, proposed by Calippus as an improvement on the Metonic cycle. *Cycle of eclipses*, a period of about 6586 days, the time of revolution of the moon's node,—called Saros by the Chaldæans.

Cycloid. A curve generated by a point in the plane of a circle rolled along a straight line. When the generating point is on the circumference of the circle the curve is a *common cycloid*; when it is within the circumference the curve is a *prolate*, or *inflected cycloid*; when without, the curve is called a *curtate cycloid*.

Cyclone. A revolving storm (which see).

Cygnus (Lat. "The Swan"). A constellation between Lyra and Pegasus. *α Cygni*, Arided, Deneb Adige. *β Cygni*, Albireo.

Cylinder. A right prism whose bases are circles. That portion of a gun between the base and reinforce. That part of a steam-engine in which the steam acts upon the piston. As its name implies, it is cylindrical in form. The ends are closed, and the piston, though closely fitted, and so kept by packing, is free to move, in direction of its axis, from end to end, the piston-rod passing though a stuffing-box on the cylinder-head. The material is of cast iron, and in the same casting are contained the "ports" for the admission and ejection of the steam, the necessary brackets for securing it to the frame, and flanges for securing the cylinder-covers and valve-chests. Steam-jacketed cylinders have a double shell, live steam being admitted to the annular space. In modern practice, the inner shell, in which the piston runs, is made separately, of very hard material, and secured by bolting and packing. Slide-valve seats are made of steel and bolted on. The cylinder casting also contains various brackets and projections for securing some lighter parts of the machinery.

CYLINDER COVER. The end of a cylinder which is bolted on and easily removable. It is usually made with a double shell, the two shells being supported by ribs, and the space between the shells is filled either with live steam or some non-heat-conducting material.

CYLINDER ESCAPE-VALVE. A valve, governed by a weight or spring, for relieving the cylinder of such water as may result from condensation or from priming of the boilers.

CYLINDER HEAD, or BOTTOM. The end of a cylinder which forms part of the cylinder casting; it has a double shell containing non-radiating material. In screw-propeller engines the piston-rod stuffing boxes are attached to the head.

Cymba. A Phœnician row-boat.

D.

D. An abbreviation on the paymaster's books for *discharged.* In the log-book *d* denotes *drizzling rain.*

Dab. The sea-flounder. An old term for a flat-fish of any kind, but usually appropriated to the *Platessa limanda.* The word is familiarly applied to one who is expert in anything.

Dabberlack. A kind of long sea-weed.

Dab-chick. The little grebe, *Podiceps minor.* A small diving-bird common in lakes and rivers.

Dace. A small river fish of the carp variety.

Dacoits. Robbers in India; also, the pirates who infested the rivers between Calcutta and Burhampore.

Dactylopterus. A genus of fishes containing two species, of which the most remarkable is the *flying-gurnard.*

Daggar. An old term for a dog-fish.

Dagger. A term given to any timber lying diagonally.

DAGGER-KNEE. Any hanging-knee which is inclined forward or aft.

Dagges. An old term for pistols or handguns.

Dahlgren, John A., Rear-Admiral U.S.N., was born in Philadelphia, Pa. Appointed midshipman from Pennsylvania February 1, 1826, and made his first cruise in the frigate "Macedonian," Brazil Squadron, in 1827–29; attached to sloop "Ontario," Mediterranean Squadron, in 1830–32.

Promoted to passed midshipman, April 20, 1832; served on the coast survey 1836–42.

Commissioned as lieutenant, March 8, 1837; cruised in frigate "Cumberland," Mediterranean Squadron, 1844–45; on ordnance duty from 1847–57, during which time he perfected the invention of the famous Dahlgren heavy guns, introduced howitzers for use afloat and ashore, and wrote several works relating to ordnance.

Commissioned as commander, September 14, 1855; commanded ordnance practice-ship "Plymouth," 1858–59; on ordnance duty at navy-yard, Washington, 1860–61.

On the 22d of April, 1861, a few days after the attack of the Baltimore mob on the Massachusetts regiment, all the officers of the Washington Navy-Yard resigned and left, except Commander Dahlgren, Lieut. Wainwright (who was absent sick), and the boatswain. The officers who left were the commodore commandant, a commander, two lieutenants, the surgeon, and paymaster; their resignations not being accepted, they were dismissed. The command, therefore, devolved on Commander Dahlgren, and vigorous measures were taken to defend the yard. After the alarm had subsided and the danger passed away, it was suggested that an old law (27th March, 1804) required a captain to command the yard. He was only a commander, and applications were made for his place; but the President refused to listen to them, and on August 2, 1861, Congress passed an act enabling him to retain the command.

Commissioned as captain, July 16, 1862, and shortly afterward appointed chief of Bureau of Ordnance.

Promoted to rear-admiral, February 7, 1863, and in the summer following ordered to the command of the South Atlantic Blockading Squadron, relieving Rear-Admiral Du Pont, July 6, 1863. A combined operation of naval and army forces, the latter under Gen. Gillmore, was instituted for the occupation and possession of Morris Island, on the south side of the entrance into Charleston harbor. After a long and severe struggle, the army operating upon land, with the efficient co-operation of the monitors, the new "Ironsides," and other vessels of the squadron, Morris Island with all its batteries was captured, and Fort Sumter was soon made a pile of ruins by the fierce artillery fire of the combined forces.

The fleet of Admiral Dahlgren remained inside the bar, and after the capture of Morris Island, blockade-running, as far as Charleston was concerned, was at an end.

In February, 1864, a successful expedition, commanded by Admiral Dahlgren in person, ascended the St. John's River to aid a military force intended to be thrown into Florida.

Early in July, 1864, a concerted move was made up the Stono River by Gen. Foster and Admiral Dahlgren. The military force was, however, too small. On this occasion Fort Johnson, the principal work defending Charleston on the south side of the harbor, was surprised by an adroit attack detached from the right, and the leading companies of a column headed by Col. Hoyt actually got into the work, but not being supported were made prisoners. Gen. Foster in promulgating by General Order the finding of a court of inquiry, stated that "the expedition was well planned, and would have succeeded had it not been for the absence of the commanding officer and the want of spirit and energy on the part of many of his subordinates."

On the 12th of December, 1864, Gen. Sherman having successfully accomplished his march to the sea, reached the vicinity of Savannah, and communication between him and Admiral Dahlgren was immediately established. The latter made the best possible disposition of the vessels then under his command to assist the army in attaining possession of Savannah, which was occupied by Gen. Sherman on the 21st of December.

On the 18th of February, 1865, the city of Charleston was evacuated, and Admiral Dahlgren at once moved his vessels up to the city.

The evacuation of Charleston was followed by

that of Georgetown, and on the 26th of February, the place itself was occupied by the admiral. On the 1st of March, immediately after the surrender, his flag-ship was blown up and sunk by a torpedo.

In 1866, Rear-Admiral Dahlgren was ordered to the command of the South Pacific Squadron; and returning from that service in 1868, was for the second time appointed chief of Bureau of Ordnance. In the fall of 1869 was relieved from the bureau at his own request, and ordered to the command of the Washington Navy-Yard, where he died in 1870.

DAHLGREN GUN. See ORDNANCE.

Dahm. An Arab or Indian decked boat.

Dairs. Small unsalable fish.

Dak-boat. See DAWK-BOAT.

Dale, Richard, Commodore U.S.N., was born November 6, 1756, near Norfolk, Va. He went to sea at twelve years of age, and rose to first mate in 1775. Served as lieutenant in a Virginia cruiser in 1776, and was captured by the British and confined in a prison-ship in Norfolk harbor; was there induced to join the enemy, but returned to his allegiance on being captured by Capt. Barry. Appointed midshipman in the navy, July, 1776; served in the "Lexington," and when that vessel was captured was instrumental in her recapture. Appointed master's mate, and sailed again in the "Lexington," in 1777, and cruised in Commodore Wicke's squadron in Irish waters. Captured by the "Alert," on the 19th September, he was thrown into Mill Prison, Plymouth, England. After an ineffectual attempt, he escaped to France in February, 1779, and there joined Jones, and was named first lieutenant of the "Bon Homme Richard"; sailed in that vessel July, 1779, and in her participated in the action with the "Serapis." He was the first to board that ship, and was severely wounded, September 19, 1779; served with Jones in the "Alliance," and returned home in the "Ariel" in October, 1780, receiving his commission as lieutenant. Sailed in the "Trumbull," and captured in her by the "Iris" and "General Monk," August 8, 1781. Sailed in merchant vessels, commanding some of the finest Indiamen until the reorganization of the navy in 1794; was then named fourth captain on the list, furloughed, and in the merchant service until 1798. He commanded the "Ganges," 20, the first ship under the new organization. Furloughed again until 1800. May, 1801, sailed in command of the European Squadron, in the "President," 44; blockaded Tripoli, and returned home July, 1802. Was again ordered to the Mediterranean, but, becoming dissatisfied, resigned. He died at Philadelphia, February 26, 1826, aged 69.—*F. S. Bassett, Lieutenant U.S.N.*

Dale. A trough or spout to carry off water; usually named from the office it has to perform; as, a pump-dale, etc.

Dallop. A heap or lump in a clammy state. A large quantity of anything.

Dam. A barrier of stones, stakes, or rubble constructed to stop or impede the course of a stream.

Damascened. The mixing of various metals in the Damascus blades, the kris, or other weapons; sometimes by adding silver to produce a watered effect.

Damascus Blade. Swords famed for the quality and temper of the metal as well as the beauty of the *jowhir*, or watering of the blades.

Damask. Steel worked in the Damascus style, showing the wavy lines of the different metals; usually termed watered or twisted.

Damber. An old word for lubberly rogue.

Damelopre. An ancient flat-floored vessel belonging to Holland, and intended to carry heavy cargoes over their shallow waters.

Dammah. A kind of turpentine or resin, from a species of pine, which is used in the East Indies for the same purposes to which turpentine and pitch are applied. It is exported in large quantities from Sumatra and Bengal, and other places, where it is much used for paying seams and the bottoms of vessels, for which latter purpose it is often mixed with sulphur, and answers admirably in warm climates.

Dampier, William. Born in Somersetshire, England, 1652. Beginning life before the mast and involved during the earlier part of his career in many questionable enterprises, Dampier sailed about in the Atlantic and Pacific Oceans until 1699, when he was taken into the service of the king of England and sent out on a voyage of discovery. He was chiefly engaged in exploring the northern coast of New Holland and the islands in the East Indian Archipelago. The results of his explorations and voyages were published and are still extant. The most notable is entitled "A Voyage round the World."

Damsel. A name for the skate-fish.

Dancers, The Merry. See AURORA BOREALIS.

Dandies. The rowers of the budgerow boats on the Ganges.

Dandy. A sloop or cutter with a jigger, on which a lug-sail is set.

Dank. Moist; moldy.

Danskers. Natives of Denmark.

Dantzic. Capital of the government of the same name, province of West Prussia, situated on the left bank of the Vistula, 3½ miles from its mouth. The river is here joined by the Mottlau and Radaune. Lat. 54° 21′ 4″ N.; lon. 18° 39′ 34″ E. The city is nearly of circular form, and ranks as a fortress of the first class, being surrounded by walls and bastions, defended by a citadel and outworks, and provided with the means of laying a part of the surrounding country under water. Among the public edifices are a school of navigation, navy-yard, and an arsenal. Vessels drawing eight or nine feet of water can reach the city; others lie in the Neufahrwasser, at the mouth of the river, or in the roads, which afford good anchorage for vessels of any burden. The proper port of Dantzic is Neufahrwasser, at the mouth of the Vistula, the number of sand-banks which encumber the river, immediately above seriously obstructing the navigation. Pop. 98,000.

Dar. A fish of the genus *Leuciscus;* called also *dace* and *dart.*

Darbies. A cant word for irons, or handcuffs.

Dark, or Colored Glasses. Shades fitted to instruments of reflection for preventing the bright rays of the sun from hurting the eye of the observer.

Darks. Nights on which the moon does not shine,—much looked to by smugglers.

Darning the Water. A term applied to the

action of a fleet cruising to and fro before a blockaded port.

Darsena. An inner harbor or wet-dock in the Mediterranean.

Dart. A sort of fish; the dace (*Leuciscus vulgaris*). See DAR.

Dartmouth. A town of England, county of Devon, on the west side of the estuary of the Dart, 32 miles S.W. of Exeter. The town is picturesquely built on a steep bank, forming a succession of terraces, and its dock-yard and quay project into the river. The Dart is defended at its mouth by a castle and strong batteries, and is navigable to the town. Pop. 5500.

Dash. The present with which bargains are sealed on the coast of Africa.

Dash-board. A term sometimes applied to a screen placed at the bow of a steam-launch, to throw off the spray when running rapidly through rough water. A spray-board.

Dash-pot. A device for easing a cut-off valve of a steam-engine to its seat when it is "tripped" or detached from the positive motion of the valve-gear and allowed to return to its seat or position of rest by the force of weights, springs, steam, or atmospheric pressure. The liquid dash-pot consists of a cylindrical vessel fitted with an air-tight plunger or piston, which is attached to the cut-off valve and moves with it, and when near the end of its descent, or position of rest, after being "tripped," impinges upon water or other liquid, the escape of which is so regulated as to permit the valve to settle gently to its seat, avoiding destructive shocks. When the plunger is withdrawn from the chamber by action of the valve-gear a partial vacuum is formed, and when it is released by the cut-off gear the atmospheric pressure causes its instantaneous return. In the Corliss engine an air-cushion is used, the valve being closed by the action of powerful springs. See CUT-OFF.

Data (Lat. from *dare*, to give). Things given or admitted. In problems the *data* are the known quantities from which are to be found the unknown quantities.

Datoo. The west wind in the Strait of Gibraltar. A Malay name for each one of the four officers who form the council of the sultan of the Malaya Islands.

David's Staff. A kind of quadrant formerly used in navigation.

Davie. An old term for davit.

Davis, Charles Henry, Rear-Admiral U.S.N. Born in Boston, Mass., January 16, 1807. Appointed midshipman, August 12, 1823; commissioned as lieutenant, March 3, 1834; commander, June 12, 1854; captain, November 15, 1861; commodore, July 16, 1862; chief of Bureau of Navigation, July 17, 1862; rear-admiral, February 7, 1863. From 1844 to 1849 he was engaged in the U. S. Coast Survey. In 1846–49, while surveying the waters about Nantucket, he discovered the New South Shoal and several smaller shoals directly in the track of ships sailing between New York and Europe, and of coasting-vessels from Boston. He was subsequently engaged in examining the state of the harbors of Boston, New York, Charleston, etc. These investigations led him to the study of the laws of tidal action. See his "Memoir upon the Geological Action of the Tidal and other Currents of the Ocean" (Memoirs of the American Academy, new series, vol. iv.), and "The Law of Deposit of the Flood-Tide" (Smithsonian Contributions, vol. iii.). He founded the "American Nautical Almanac," superintending it from 1849 to 1856, when he was ordered to naval service in the Pacific, in command of the sloop-of-war "St. Mary's." He was fleet-captain in Dupont's expedition against Port Royal, and second in command, and was assigned to the Mississippi Flotilla. May 9, 1862, he was appointed flag-officer of the flotilla, and on the 11th repulsed an attack by the rebel fleet. June 8, he attacked the rebel fleet opposite Memphis, capturing or destroying all but one vessel. The surrender of Memphis immediately followed. He then joined Admiral Farragut, and was engaged in the various operations above Vicksburg. With Gen. Curtis, he operated up the Yazoo in August, 1862, with complete success. Superintendent Naval Observatory, Washington, 1865–67; commanded South Atlantic Squadron, 1867–69; LL.D., Harvard College, 1868; superintendent Naval Observatory, 1870–77. Died at Washington, D. C., in 1877. Author of an English translation of Gauss's "Theoria Motus Corporum Cœlestium," Boston, 1858, and of some shorter translations and articles on mathematical astronomy and geodesy.

Davis, John, an eminent navigator of the latter part of the 16th century, was born at Sandridge, near Dartmouth, and is principally distinguished for having, between 1585 and 1588, undertaken three voyages to the northern seas in search of the northwest passage. In the first voyage he sailed as far north as the 73d degree of latitude, and discovered the strait which bears his name. He afterwards made five voyages to the East Indies, in the last of which he was killed in a fight with some Japanese on the coast of Malacca in 1605. "The World's Hydrographical Description, wherein is proved that the World in all its Zones, Climates, and Places is Habitable and Inhabited, and the Seas likewise universally Navigable" (London, 1595), and "The Seaman's Secrets, wherein is taught the Three Kinds of Sailing, Horizontal, Paradoxal, and Sailing upon a Great Circle" (London, 1595), are the two principal works written by Davis, but he was also the author of several others.

Davits. The *boat-davits* are pieces of iron or wood projecting over the side or stern; to them are attached the falls for hoisting the boats. They are supported by guys, spans, topping-lifts, and strong-backs, and are fitted in a variety of ways that the boats may be landed on the rail, swung in on deck, topped up to be secured for sea, rigged out for lowering, etc. They are sometimes so fitted that one pair supports two boats. A *fish-davit* was formerly used in fishing the anchor. It was a perpendicular spar temporarily stepped abaft the bill-board, and was supported by guys, bill-tackle, topping-lift, and jiggers.

Davy Jones. The spirit of the sea; a sea-devil.

DAVY JONES'S LOCKER. The ocean,—the common receptacle for all things thrown overboard. *Gone to Davy Jones's locker*, dead, buried at sea.

Daw-fish. The *Scyllium catalus*, a small dog-fish.

Dawk-boat or Dak-boat. An East Indian mail-boat.

Day. The time occupied by a complete revolution of the earth on its axis. Some point must be chosen to mark the commencement of a day, and the choice gives rise to several different days which differ from each other slightly in length. The scientific term "day" is never used in the sense of *day* opposed to *night*.

Day, Astronomical. The day used by astronomers to which to refer their observations, being distinguished from the *civil* day which regulates the ordinary business of life. The astronomical day begins at noon and ends at noon, its hours being reckoned from 0^h to 24^h; the civil day begins at midnight and ends at midnight, its hours being reckoned through twice 12. The astronomical is later than the civil day by 12 hours. The cause of this inconvenient difference in the modes of reckoning is, that astronomers carry on their observations chiefly at night, and if they, therefore, adopted the civil method of reckoning, they would have to change the date at midnight, the former and latter portions of every night's observations belonging to two differently numbered civil days of the month. It has, however, been questioned whether this inconvenience would be as great as that resulting from the present neglect of uniformity in reckoning time. According to the point of definition chosen the astronomical day is either a *sidereal day*, an *apparent solar day*, a *mean solar day*, or a *lunar day;* the term, when used alone, is usually understood to refer to the *mean solar day*. Reckoning in mean solar time, which is the same as civil time, a mean solar day is 24^h, a sidereal day $23^h\ 56^m\ 4.09^s$, and a lunar day, $24^h\ 0^m\ 54^s$.

Day, Circumnavigator's. A ship sailing westward runs away from the sun in his diurnal course, and, when she has circumnavigated the globe, the sun will evidently have crossed her meridian once less frequently than if she had remained stationary. On the contrary, a ship sailing eastward meets the sun in his diurnal course, and, when she has circumnavigated the globe, the sun will evidently have crossed her meridian once more frequently than if she had remained stationary. Hence a westwardly circumnavigator loses a day in his reckoning, an eastwardly circumnavigator gains a day. The alteration of the date, by inserting a day or leaving out one, in the ship's log-book should be made on crossing the meridian of 180°.

Day, Civil. The day used for the ordinary purposes of life. The motion of the sun in the heavens, bringing the alternations of light and darkness, determines generally our social arrangements, and time being kept by mechanism, the day must be of invariable length. Hence the civil is of the same length as the mean solar day. It differs, however, from the astronomical mean solar day in the following points. The astronomical day begins at noon and ends at noon, its hours being reckoned from 0^h to 24^h; the civil day begins at midnight, and its hours are reckoned through twice 12, from midnight to noon (ante meridiem, A.M.), and then from noon to midnight (post meridiem, P.M.). The commencement of the astronomical day is placed 12 hours later than that of the civil day.

Day, Intercalary. The day that is intercalated or inserted in the calendar in leap-year to make up for the odd hours, minutes, and seconds of the tropical year which have been left out in making the civil year to consist of 365 integer days. See Calendar.

Day, Lunar. The time elapsed between two successive transits of the moon over the meridian.

Day, Nautical, or Sea. This begins at noon, 12 hours before the civil day and 24 hours before the astronomical day. It is now little used.

Day, Sidereal. The interval between two successive transits of the first point of Aries over the same meridian. This is called a *sidereal* day, although not strictly determined by the stars; but the very slow motion of the first point of Aries relatively to the stars makes this day practically the same as if a fixed star had been taken, for if two clocks be set, the one on the first point of Aries, the other on the fixed star, so as always to mark $0^h\ 0^m\ 0^s$ when the *point* or the *star* respectively comes to the meridian, the difference of the two clocks would only be about 3^s in a whole year. The length of the sidereal day in mean solar time (which is the same as civil time) is $23^h\ 56^m\ 4.09^s$.

Day, Solar. The interval between two successive transits of the sun's centre over the same meridian. The *apparent solar day* is the interval between two successive transits of the actual sun's centre over the same meridian; it begins when that point is on the meridian. The apparent solar day is variable in length from two causes: first, the sun does not move uniformly in the ecliptic,—its apparent path sometimes describing an arc of 57′, and at other times an arc of 61′ in a day; secondly, the ecliptic twice crosses the equinoctial,—the great circle whose plane is perpendicular to the axis of rotation,—and hence is inclined differently to it in its different parts; at the points of intersection the inclination is about 23° 27′, at two other limiting points they are parallel. A uniform measure of time is obtained by the invention of the *mean solar day*, which is the interval between two successive transits of the *mean sun* over the meridian. This fictitious body is conceived to move in the equinoctial with the mean motion of the actual sun in the ecliptic. The length of the mean solar day is the average length of the *apparent solar days* for the space of a solar year.

Day-book. An old name for the log-book.

Day's Work. The work of computation required in navigating a ship for every twenty-four hours; the term is generally restricted to the dead-reckoning. At each noon the latitude, longitude, and the course and distance made good are wanted, together with the compass course to be steered during the next twenty-four hours. The data for this work are the latitude and longitude at the preceding noon; the compass courses and distance run on each course during the twenty-four hours; the variation and deviation of the compass; particulars of the force and direction of the wind and the consequent leeway, and the set and drift of the current.

D-block (*obs.*). An oak block of the shape of the letter D, bolted to the ship's side in the channels for the lower lifts.

Dead-calm. A total cessation of wind; a *flat-calm*.

Dead Centre or Dead Point. In single steam-engines, a position of the moving parts when the

piston is at either extreme end of its stroke, and the axis of the connecting-rod, crank-pin, and shaft lie in the same plane. From this position it is impossible to start an engine at rest by piston-pressure, and it becomes necessary to "jack" or turn some rotative part by external force. When the engine is once in motion these points are passed by the momentum of the rotating parts. Double engines are connected by cranks placed at such an angle one with the other that one only can arrive at the dead point at the same instant.

Dead-door. A door fitted to the outside of the quarter of a ship, to keep out the sea in case the quarter-gallery should be carried away.

Deaden. To retard, or render less; as, to deaden a ship's headway.

Dead-eye, or Dead Man's Eye. A piece of hard wood of oblate form having three holes, through which is rove the laniard for setting up the backstays and lower and topmast rigging. The laniard is rove through two dead-eyes, forming a threefold purchase; the lower dead-eye is shackled to the chain-plate, and the upper one is secured to the shroud. There are several ways of securing the dead-eye to the shroud, viz.: splicing, turning in by the old method, turning in cutter-stay fashion, and turning in by the present mode, in which, instead of being taken around the dead-eye itself, the shroud is taken around a heavy iron thimble bolted to the iron strap of the dead-eye.

Dead-flat. In ship-building, the name of the widest frame in the ship.

Dead-freight. The sum to which a merchant is liable for freight which he has failed to ship.

Dead-head. A rough block of wood used as an anchor-buoy.

Dead-headed. A word applied to trees which have ceased to grow.

Dead-horse. Wages paid before they are earned. In some merchant ships when the dead-horse has been worked off, *i.e.*, when the men have served long enough to earn the money advanced, they perform the ceremony of dragging the effigy of a horse around the deck, running him up to the yard-arm and cutting him adrift to fall into the sea.

Dead-lift. The lifting of a thing at the utmost disadvantage.

Dead-lights. Strong wooden shutters made exactly to fit the cabin ports, into which they are fixed on the approach of a storm, the glass sashes being taken out.

Dead-lown. Dead-calm.

Dead-men. The ends of gaskets and points left dangling under the yards, which should have been tucked in when the sail was furled.

Dead Men's Effects. When a seaman dies on board or is drowned his effects are sold at the mast by auction, and the produce charged against the purchasers' names on the ship's books.

Dead Months. A term for winter.

Dead-on-end. A term applied to the wind when it comes exactly from the point to which the ship is to steer.

Dead-pay. See DEAD-SHARE.

Dead-reckoning. The method of determining the ship's position without the aid of astronomical observations.

Dead-rise. The rise of the floor of the ship from a level, usually taken on the midship frame in inches or degrees from the centre line.

DEAD-RISING. An elliptical line drawn on the elevation plan, or profile of the ship, to determine the sweep of the floor-heads throughout the ship's length. Sometimes called *rising-line.*

Dead-rope. Ropes which do not run through any block.

Dead-share (*Eng.*). An allowance formerly made to the officers of the fleet from fictitious numbers borne on the books, varying from fifty shares for an admiral to half a share for the cook's mate.

Dead-sheave, or Dumb-sheave. An aperture in which a rope travels, and which has no sheave.

Dead Steam. Steam possessing sufficient heat to retain it in a state of vapor at any tension, but incapable of performing work without condensation; this may be observed in boilers with "banked" or very low fires.

The exhaust steam from a non-condensing engine when used for heating purposes.

Dead-water. The eddy-water under the counter of a ship under way; so called because it passes away slower than the water alongside.

Dead-weight. A vessel's lading when it consists of heavy goods; particularly such as pay freight according to weight.

Dead-wood. That part of the ship which is built forward and abaft the square frames of the ship, in wooden ships, upon which the cants are stepped and secured. It is firmly bolted, both to the keel and stern-post aft, and to the keel and stem forward.

DEAD-WOOD-KNEE is the first piece of the after dead-wood, and is placed as a large knee (in wooden ships), with the arm against the stern-post and the body upon the keel, and it is secured to both with heavy bolts.

Dead-works. All that part of the ship above water when she is laden.

Deal. A town of England, county of Kent, a member of the Cinque-port of Sandwich, from which town it is 5 miles S.E., on the shore of the North Sea, near the S. extremity of the Downs, 8 miles N.N.E. of Dover. The principal buildings are a court-house, naval store-house, barracks, hospital, and custom-house. At the S. and N. extremities of the town are Walmer and Sandown Castles, and intermediate is Deal Castle, built by Henry VIII. The inhabitants are mostly connected with maritime traffic, and the skill and boldness of Deal pilots are proverbial. Pop. 8100.

Deal. Pine and fir boards or thin plank.

Deal Beach (*Eng.*). This beach consists of gravelly shingle; a man who is pock-marked is said to have rolled on Deal beach. See CHOP-DOLLAR.

Deal-ends. Deal-planks under 6 feet in length.

Death. If the commander-in-chief be killed in battle he is succeeded by the line-officer next in rank on board the flag-ship, until the senior officer of the fleet announces that he has assumed command. The flag of the deceased is kept flying until the battle is decided.

If the commanding officer die, he is succeeded by the line-officer next in rank, until relieved by orders from the commander-in-chief, or Navy Department, even though there be officers on

board, as passengers, of higher rank. On the death of the paymaster of a vessel or station the commanding officer appoints a suitable person to take charge of the money, books, and stores, and to perform the duties of the paymaster until otherwise directed by competent authority.

On the death of any person in the naval service the medical officer is required to make a report, in which is stated distinctly the circumstances under which the death occurred, and whether or not in the line of duty. See FUNERAL HONORS.

Death, or Money Boats (*Eng.*). Long narrow boats used by smugglers in the English Channel.

Death-wound. A law-term for the springing of a fatal leak. A ship had received her death-wound, but by pumping was kept afloat till three days after the time for which she was insured; it was decided that the risk was at an end before the loss happened, and that the insurer was not liable.

Debark. To land; to go ashore.

Decatur, Stephen, son of Capt. Stephen Decatur, was born on the 5th of January, 1779, at Sinnepunxit, Md. Entered the navy in March, 1797, as a midshipman, and joined the "United States," Capt. Barry, cruising in the West Indies. Promoted to lieutenant in 1799, and cruised in the brig "Norfolk," 18, returning to the frigate "United States" in 1800. Sailed as first lieutenant of the "Essex," in Dale's squadron to Algiers, in 1801–2, returned, and ordered to the "New York," 36, again going to the Mediterranean. In the fall, on his return, took the "Argus" out to the same squadron, and was transferred to the command of the "Enterprise." Had command of the force that destroyed the "Philadelphia," taking the ketch "Intrepid," which he had captured. For valor in this was promoted to captain in 1804, and a sword given him. Commanded a division of boats in an attack on Tripolitan gunboats, August, 1805, where he was wounded in a personal combat, but captured two prizes. Commanded the "Constitution," and engaged in attacks of 28th of August and 3d of September. In November transferred to the "Congress," sent to interview the Bey of Tunis, and carried to the United States his minister. Employed on shore 1806–7, and given command of the "Chesapeake," superseding Barron. But in 1811 he hoisted his broad-pennant in the "United States," 44, and captured the English sloop "Macedonian," October 25, 1812, in a brilliant engagement. Entering New York with his prize, he was blockaded, and his ship laid up, when he was given the "President," 44. He sailed in January, 1815, but was captured by an English fleet on the 14th. Commanded a fleet sent to Algiers in May, 1815, in the "Guerriere," 44, and on the 17th of June captured the "Mashouda" with the Algerian admiral. Arrived home November 12, 1815, having obtained reparation from the Barbary powers. Was a Commissioner of the Navy from 1817 to 1819. He having opposed Barron's having a command, a difficulty ensued, and a duel was fought, March 22, 1820, when Decatur was mortally wounded, and died the same day, aged 41.—*F. S. Bassett, Lieutenant U.S.N.*

Décimètre (*Fr.*). One-tenth of a mètre, and equal to 3.937 English inches.

Deck. The planking placed upon the deck framing which makes a continuous platform, fore and aft the ship. The deck is said to be a Thasian invention, and was at first used as a protection for the rowers. A deck may extend from the stem to the stern; as, the gun-deck; or be but partial; as, the deck of a topgallant forecastle. The *upper*, or *spar-deck* extends from stern to stem; the part of the spar-deck from the mainmast aft is the *quarter-deck;* when there is a poop-cabin, the deck which protects it is called the *poop*, or *poop-deck;* it extends from the mizzen-mast aft. A *gun-deck* is a deck below the spar-deck on which guns are carried. The *berth-deck* is a deck next below the gun-deck, on which are stowed the bags, etc., and on which are swung the hammocks of one watch. The *orlop-deck* is the deck on which the cables are stowed; it is below the water-line. The *half-deck* is that portion of the deck next below the spar-deck, from the mainmast to the cabin-bulkheads. In a three-decker, the three gun-decks are called the *main*, *middle*, and *lower* decks. In river-steamers the *boiler-deck* is the one on which the boilers are placed, and the *hurricane-deck* is the upper deck.

DECK-BEAM. One of the heavy pieces of timber extending across the ship on which the decks are laid.

DECK-BEAM KNEE. Any one of the knees in the deck framing, either a lodge or a lap knee, which is secured to the beam by its arm.

DECK-CARGO. See DECK-LOAD.

DECKER. According to the number of gun-decks a vessel has, she is distinguished as a single-decker, two-decker, or three-decker.

DECK, FLUSH. One in which there is no break.

DECK-HOOK. A large knee either forward or aft, which is placed, as a part of the deck framing, at the extremities, and secures both sides of the ship to each other.

DECK-LOAD. Merchandise carried on the upper deck.

DECK-PIPE. The aperture in the deck through which the cable passes from the chain-locker to the anchor.

DECK-PUMP. A pump used for pumping water for washing decks; it is worked by hand.

DECK-SEAM. The interstices between deck-planks.

DECK-SHEET. Lower and topmast stun'sails are fitted with two sheets; the one leading directly to the deck is called the *deck-sheet.*

DECK-STANDARD KNEE. A large knee of oak or iron fayed on the deck and against the side of the ship. The arm being placed upon the deck, is bolted through the beam and clinched underneath, and the other arm is bolted to the ship's side. Their use was to strengthen the sides. They are sometimes used upon wooden merchant ships, aft on the middle deck, one arm being bolted to the deck and the other arm of the knee fayed against the transoms, to which it is securely bolted.

DECK-STOPPER. See STOPPER.

DECK-TACKLE. A heavy luff or twofold purchase used for rousing in the cable, or other heavy work.

DECK-TRANSOM. The transom which comes to the same level or height of the deck at the after-end, and to which the framing of the deck is secured.

Declaration of War. See INTERNATIONAL LAW.

Declare. To make a full statement of goods, etc., for the purpose of paying custom-house duties.

Declination. The angular distance of a heavenly body from the equinoctial; it is reckoned from 0 to 90° north or south. The complement of the declination is the polar distance.

DECLINATION, CIRCLE OF. See CIRCLE.

DECLINATION, PARALLEL OF. A circle of the celestial sphere parallel to the equinoctial.

DECLINATION OF THE COMPASS-NEEDLE. A term sometimes used for the *magnetic variation* of the compass-needle.

Decoy. The appearance of a man-of-war is sometimes changed by striking topmasts, setting ragged sails, painting, etc., to induce a vessel of inferior force to chase, and thus come within gunshot.

Decrès, Denis. This distinguished French naval officer was born in 1762, and died in 1820. Entering the French navy at the age of 17, he first served in the fleet of Count de Grasse, and in the battle of April 12, 1782, in the West Indies, he won his promotion to ensign, although the fortune of the day was against the French.

From this time his promotion was rapid, as he distinguished himself in the frigate squadron which France sent to the East Indies.

In 1793 he was a "capitaine de vaisseau," but was deprived of his rank, and imprisoned by the revolutionists because he was a noble. Escaping more easily than thousands of others, he was at last released, and restored to his rank in the navy, in 1795. In 1798 he had reached the rank of rear-admiral, and in that capacity assisted in the capture of Malta.

After this he served at the battle of Aboukir, and led back to Malta the few French vessels which escaped from that action, and these were soon blockaded by the English in the harbor of Valetta. Decrès, in conjunction with Gen. Vaubois, conducted the defense of Malta, which lasted seventeen months. In March, 1800, provisions falling short, and much sickness appearing in the French garrison, Decrès embarked about 1200 men on board the "Guillaume Tell," and forced the blockade. The English frigate "Penelope" followed him, and next day the "Guillaume Tell" fell in with the English ship "Lion," 64, a sanguinary action ensuing, during which Decrès boarded the "Lion" twice, but was each time driven off. The "Lion" at last hauled off to repair damages, and just then the English "Foudroyant," 86, came up, and the "Tell" sustained an hour's fight with her, the "Lion" coming again into the action. Decrès tried boarding the "Foudroyant," but unsuccessfully, and the "Guillaume Tell" was obliged to surrender. Decrès was wounded by an explosion, as were his captain and several of his officers, while nearly half his crew were killed or wounded. The frigate "Penelope" was able to take the dismasted "Tell" in tow, and reached Syracuse, while the two larger English ships with great difficulty got to Mahon. For this hard-fought action Decrès received a sword of honor from the First Consul, and the English "Naval Chronicle" states that his was the warmest resistance ever made by a foreign man-of-war against a superior British force. Decrès, upon his return from captivity in England, was successively appointed préfect maritime, commandant of the western fleet, and minister of marine. He continued to act in the latter capacity as long as the empire lasted, showing great administrative ability.

During his administration the great works at Cherbourg were materially advanced, as well as those at Nieuwe-Diep, and Flushing, while the docks and ship-yards of Antwerp were wholly created. He managed to keep up and even increase the strength of the French navy in spite of their great losses at sea, and collected the great flotilla of Boulogne which events, however, rendered useless. Napoleon, who made him in succession a count, grand cross of the Legion of Honor, and finally a duke, recalled him to his old position during the Hundred Days, and when the emperor finally fell, he was retired by the Bourbon government.

Duke Decrès survived many bloody battles to be at last assassinated by his valet. This man, who had for a long time been robbing him, placed a quantity of powder, with a slow match, between his mattresses. Stealing into the duke's bedroom in the night, he blew him up. The valet, in his fright and perturbation at what he had done, threw himself out of the window and was killed; his master died a few days after, aged 58 years.—*E. Shippen.*

Deep. Lying far below the general level; of great perpendicular dimension, conceived of as measured downward. The word is figuratively applied to the ocean; as, "Neptune, the monarch of the deep." A vessel is loaded *deep* when her cargo causes her to be much immersed in the water; she sails *deep* when her expenses run high. See MARKS AND DEEPS.

DEEPEN. The water *deepens* in running from shoal into deep water.

DEEP-SEA LEAD. The sounding-lead used in deep water. See LEAD.

DEEP-SEA LINE. The line attached to the deep-sea lead. See LEAD.

Deep-sea Sounding. From the beginning "when the waters were gathered together unto one place," until within the latter half of the 19th century, the depth of the sea has been a mystery which in every phase and epoch of civilization baffled the skill and patience of the seaman, the quest and genius of the philosopher, the curiosity of the idler, and the impracticability of the dreamer; but so great has been the fascination of the problem that probably no one ever got on blue water, however careless of other aspects of nature, who did not dream and ponder over the seemingly impenetrable mystery that lay below, and long for the seal to be broken, that a glimpse at the secret of the ages might be given him. Indeed, so great and continuous had been the failure of skilled and experienced seamen, of every name and nation, to fathom the depths and get answer to their anxious questioning, that it had come to be a popular belief the ocean was quite bottomless in some places; that the weight and pressure of the superincumbent water increased the density of the lower strata to such a degree that things thrown into the sea floated at different levels, according to their specific gravity; that below a certain depth a temperature of 39° F. was uniformly found; and that no animal life could exist on the lower

planes and valleys of the ocean-bed. And, when it is considered that the pressure for every mile below the surface is a ton per square inch, it is not to be wondered at that such notions prevailed in the general mind, prone to forget that water is practicably incompressible.

The great difficulty of sounding in "blue water" arose from the fact that, as the plummet descended, the weight of the line, and its running out, retarded by the attendant and ever-increasing friction, and diverted by the action and freaks of submarine currents, neutralized, as it were, the momentum of the lead, playing havoc with its indications, and making it impossible to tell with any degree of certainty the moment of touch bottom beyond a depth of 800 or 1000 fathoms; especially as the line, made doubly heavy by its absorption of water, would continue to run out simply from its own weight long after the sinker had buried itself in the ocean-bed, and, with the life stretched out of it, often broke in hauling back; hence the work of hours on such occasions appeared only to demonstrate the seeming impossibility of getting at the depths, and the most extraordinary results were reported and accepted, as, for instance, where Capt. Denham, R.N., assumed that he had made a reliable sounding at a depth of more than 8 statute miles in the South Atlantic; or where Lieut. Parker, U.S.N., reported an attempt made in the same ocean off the coast of Brazil with 50,000 feet run off the reel-sounding from a boat, without, as he thought, getting bottom; or where Capt. Ringgold, U.S.N., reported finding a depth of 9 statute miles in the Indian Ocean, 1855, using the apparatus known as the Brooke.

In these efforts to measure the depths, distinguished naval officers of the principal maritime powers vied with one another in their endeavors to penetrate the secrets of the ocean-bed, but the impartial student, of whatever nation, will accord the U. S. naval service and Coast Survey merited prominence in diligent and persistent effort, inventive appliance, and intelligent adaptation of ideas and methods, from whatever source, towards the satisfactory solution of the problem. It was the good fortune, however, of Sir William Thomson, of Glasgow University, distinguished in many fields of science, and especially for his inventions making practicable ocean telegraphy, to conceive the best and simplest means of measuring the depths; and today, thanks to his genius, it is as easy for the questioning seaman or scientist to bring back answer from the depth of five miles as it formerly was from a depth of a quarter of a mile. The general mistake made by the indefatigable seekers was in allowing the line to run out too freely as the plummet descended, as will be seen farther on. It was difficult, too, to keep the old sailing-craft in position, owing to drift, heave of sea, and constant motion of the vessel, obstacles well-nigh overcome in these later days of research, when steam has come to the aid of the laborer in every field; and nowhere does the masterful power of that fierce agent find better illustration than in its triumphs on the restless and turbulent sea, enabling the seaman to do now with ease and certainty what would have been regarded as impossible and visionary half a century ago. In a paper, prepared by the writer for the American *United Service* magazine in 1879, it was stated that the first attempt made to sound with wire was from H. M. S. "Thunder," Capt. Barnett, R.N., August, 1849. This was an error; most, if not all the vessels of the U. S. Exploring Expedition, which sailed from Norfolk, Va., in 1838, under command of the late Rear-Admiral Charles Wilkes, then a lieutenant, were supplied with copper wire, about 3.32 of an inch in circumference, the splices twisted and soldered.

In trying the wire on board the "Relief" of that expedition, it parted when some 500 fathoms were out; on board the flag-ship "Vincennes" the soundings were somewhat deeper, but the results were generally unsatisfactory, owing to constant losses of wire; and before the expedition was on its homeward route, 1842, its use was abandoned. The wire used on board the "Thunder" was of iron, varying in size from Nos. 1 to 5, the sinker weighing 61 pounds. Only one trial was made, and the wire broke at 2000 fathoms. It had run out in twenty minutes, fifty-three seconds; rapid work, indicating that no restraint had been put upon the reel, and the break was doubtless due to the parting of a splice, or a jerking strain caused by the rolling of the ship; this attempt was made between the banks of Newfoundland and the Western Islands. Three months later, the same year, 1849, the U. S. schooner "Taney," Lieut. J. C. Walsh commanding, experimented with steel wire in the vicinity of the Bermudas. The wire broke when 5700 fathoms had run out, and Walsh reported no bottom at that great depth; the fact was that bottom had been struck when half the wire had run out, as subsequent soundings have shown. The wire was of three sizes, Nos. 5, 7, and 8, Birmingham gauge, and its average weight in water about 180 pounds to the mile. It was wound on an iron reel, controlled by brakes and friction-bands, and swivels were fitted next the sinker and at every thousand fathoms, to counteract the tendency to twist. The lengths were marked with copper labels, and the sinker weighed only 10 pounds; but 6 pounds more should be added for the weight of the registering-machine devised by Maury and used on this occasion. The sinker was obviously too light, for with less than 200 fathoms out, the weight of the wire, the No. 5 size being 0.22 inch in diameter, would already exceed that of the lead, and the momentum and influence of the latter be swallowed up, as it were. Had the sinker weighed 400 pounds, which the size and strength of the wire seemed to admit, the trial would doubtless have been successful, taking it for granted that the descent was controlled by the friction-brakes.

Other trials were made from the "Taney," but with no better results, the wire generally parting at 2000 fathoms. Walsh does not seem to have mentioned the cause of these repeated losses, and in the midst of his experiments he found the vessel unseaworthy and had to return home, under convoy of the U. S. brig "Porpoise," 1850, the present Rear-Admiral B. F. Sands, U.S.N., commanding, the writer serving on board his first cruise as midshipman, little dreaming that he himself was to become somewhat identified with deep-sea exploration later on. These experiments with wire in our own and the English service, seem to have convinced

the naval mind of the uselessness of further attempt in that direction, and the idea slumbered until awakened by the magic touch of Sir William Thomson's hand twenty-three years later, transforming failure into pre-eminent success.

Nothing daunted at these repeated failures, the U. S. Coast Survey, under the able superintendence of the learned and energetic Bache, kept actively at work surveying the coasts of the Atlantic, Pacific, and Gulf of Mexico, exploring the Gulf Stream for depths and temperature, and devising new methods and appliances for the advancement of hydrographic science; while Maury, the father of the science of the physical geography of the sea systematically pursued, and superintendent of the National Observatory, and in charge of all matters pertaining to navigation under the cognizance of the Bureau of Ordnance and Hydrography at that period, 1850, stimulated effort on the part of the naval service.

Be it said in passing that as, with the exception of the period embraced by the civil war, the greater part of the hydrographic work of the Coast Survey has been done by naval officers, both branches of the service may be considered as twin sisters in that regard; and, indeed, the navy claims to be the elder of the twain in all that pertains to the prestige of skilled achievement, inventive genius shown, and well-earned reputations made, in the conduct of that great national work which maps the way for the mariner all along a magnificent coast-line of more than 13,000 miles, and puts into the hands of the scientist the data which, in some measure, tell the earth's ancient story.

Now discarding both wire and rope, the U. S. naval service, at the instance of Maury, adopted the use of flax twine of exceptional strength, weighing a little less than 9 pounds to the statute mile, wound on light running reels in lengths of 10,000 fathoms. 32-pounder shot were selected for sinkers as available in every ship of war at that period, 1850. These reels of twine were supplied every cruiser asking for them, but the first approach to success with such appliances was on board the U.S.S. "Albany," Commander Platt, in the Gulf of Mexico, and under the supervision of Lieut. (now Rear-Admiral) Wm. Rogers Taylor.

Taylor tried and adopted the method of time intervals as a help in interpreting the time of the arrival of the lead on the bottom, and though much discouragement resulted from frequent losses of twine, he was pretty confident of having measured the depths with tolerable accuracy; but no sinkers had been hauled back, owing both to weak places in the twine and the wonderful retarding influence of friction, which, though somewhat diminished by waxing the twine, was not enough to more than partially overcome the difficulty.

Some question has arisen as to who originated the method of "time intervals," but it would seem that Capt. James F. Ross, R.N., noted the intervals March, 1840, sounding the Cape of Good Hope from H. M. S. "Erebus" in 2677 fathoms. The cast seems to have been made from boats, the reel of 5000 fathoms line probably rigged between them. The first length of line of 437 fathoms next the sinker, which weighed 540 pounds, was of a single strand of whale-line, the rest of two strands of spun yarn. Capt. Crozier kept the time of descent. "When the weight struck bottom," says Ross, "it stopped so suddenly that the boat's crew all called out 'it is down.'" The great weight of the sinkers in proportion to the size of line was a notable step towards the solution of the problem, and it is surprising that later explorers did not follow more closely this experience in that regard. The noting of the intervals does not seem to have been with a view to the interpretation of the final result; the great weight of the lead was depended upon for that; and, continues Ross, with pardonable glow, "nothing could be more satisfactory than this sounding, and it is the more so that we have the means of getting soundings however deep the sea may be." Yet despite this rose-colored view how much discouragement subsequently resulted to other workers! The fault seems to have been in a lack of system, which did not give sufficient heed to the experience of explorers of different nationalities and at various periods. Capt. Barnett, too, of the "Thunder," marked the intervals, sounding in the North Atlantic, 1849, but Taylor seems to have been the first officer to deduce from the rate of descent a rule whereby to signal with some degree of accuracy the arrival of the lead on the bottom, which rule observed by Lee and Berryman, and perfected by Spratt and Brooke, has been the main reliance in determining the accuracy of deep-sea work until the Thomson machine superseded and rendered such method practically obsolete. A notable exception to this, however, has been the continued use of the time-interval interpretation by the "Challenger" in her recent famous expedition around the world.

But to return. Tables were constructed for different weights of sinkers and sizes of lines, showing the rate of descent of each 100 fathoms, and any marked or disproportionate increase in the intervals of time would indicate the reaching of bottom; but the observer would need to watch the line sharply and become very familiar with all the indications to interpret correctly the moment of touch; hence a good deal of line often ran out before it was discovered that the lead was on the bottom, and some of the soundings reported by Lee and Berryman were in excess of the actual depth as subsequent research has shown. While these experiments on board the "Albany" were still in progress, Lieut. (now Rear-Admiral) S. P. Lee sailed from New York, October, 1851, in the "Dolphin" brigantine, having been detailed for the special duty of "testing new routes and perfecting the discoveries made by Lieut. Maury in the course of his investigations of the winds and currents of the ocean," and he was instructed to make deep-sea soundings in favorable weather. The sounding apparatus supplied was similar to that tried on board the "Albany," modified and improved by the experience of that vessel; but Lee adopted the idea of sounding from a boat instead of from the deck of the brig, believing that by means of her oars the boat could be readily kept over the line and give a plumb sounding, a thing quite impossible from a ship not controlled by steam. Small waxed fishing-line was used, with 32-pound shot for sinker. The line ran through a small bull's-eye, held in one hand by a quarter-

master, who gave line with the other when necessary to relieve the sinker from the resistance of the reel. The reel was mounted on a stand placed at the stern of the boat, and turned on friction-rollers. "When the shot struck bottom," says Lee, "stopped pulling, let the boat settle, and tried the currents; if the line did not part, then cut the line." No attempt was made to haul back the sinker; the principal thing considered was to ascertain the depth without reference to the character of the bottom. The verification of the sounding and the gratification of response from the ocean-bed was lacking to complete the effort, and such work could only be done in good weather, with smooth sea and all favoring circumstances. The "Dolphin" cruised eight months and made 89 deep casts, but the line parted in 34 of them, and doubt hung over the results in some others; still, it was considered good work had been done, and that the brush of difficulty had in a measure been cleared away.

Lieut. O. H. Berryman now succeeded Lee in command, and continued the work of exploration in the North Atlantic, 1852–53; and though some of his soundings were in excess of the actual depths, as has since been shown, the general results, as with Lee, were regarded as the most satisfactory and accurate that had hitherto been obtained.

The "Dolphin's" soundings developed a ridge about one-third across the Atlantic to the eastward of the Antilles, with a depth of from 1900 to 2000 fathoms over it, which has been called the Dolphin Rise. This "rise" seems to be a continuation in a south-southwesterly direction from the Azores of what is known as the telegraphic plateau discovered by Berryman. While Berryman was yet exploring in the "Dolphin," Mr. Cyrus W. Field was beginning to interest himself in the subject of ocean telegraphy, and it was to be the good fortune of Berryman to link his name with that of Mr. Field in connection with the first and most important great ocean cable laid. In the latter part of 1853, Mr. Field's aid was solicited towards the completion of the submarine line between St. John's and Newfoundland; and, enlarging the horizon of that scheme, Mr. Field obtained the grant of a charter for himself and associates to connect Europe and America by submarine cable *via* Newfoundland.

The needs of the age demanded submarine communication, and the demand, given living form and embodiment, as it were, by the energetic and prescient action of Mr. Field, quickened and stimulated effort to measure the depths; but not only the depth was required, but the character of the bottom also, for a cable made to rest on bed of ooze, sand, or clay would not do for rocky ridge or pebbly plain.

At this juncture, Passed Midshipman John M. Brooke, U.S.N., now Professor Brooke, Military Institute, Lexington, Va., came forward with his beautiful and timely invention for leaving the sinker on the bottom and bringing back a specimen of the soil from the ocean-bed. The invention consisted of a light iron rod, terminating in a cup at one end and with trigger fitted at the other, the rod passing through a hole, bored or cast, in a cannon-ball or shot of the desired weight.

In descending, the shot hung from the triggers by means of slings, and was upheld by the line made fast to the triggers above the ends of the slings. The moment bottom was struck the line would slacken, and the weight of the shot pulling down the triggers would cause the slings to slip off, releasing the shot and leaving it behind. The cup of the rod had quills fastened in it for the purpose of bringing up specimens of the bottom soil. Though the apparatus was first brought prominently forward in 1854, Passed Midshipman (now Commodore) Earl English, U.S.N., was the first person to test its capabilities in deep water, sounding from one of the "Dolphin's" boats, the brig still under Berryman's command, August 22, 1853; lat. 50° N., lon. 14° W., in 1580 fathoms, or a depth of nearly two miles, bringing up a good specimen of yellowish-white chalky clay. This was undoubtedly the first time a specimen had been brought up from so great a depth, and English states that "during the remainder of the cruise the Brooke machine was almost exclusively used, with perfectly satisfactory results."

Prior to that sounding the casts had been made as heretofore described,—the time-interval method, with no attempt to haul back the line, —"which process," English continues, "he never regarded as satisfactory or conclusive."

Other devices had been tried for bringing up specimens from as great depths as it had hitherto been possible to sound with rope, but Brooke's idea of leaving the sinker on the bottom seems to have been the first successful invention towards that end. Sir John Ross, R.N., had in Baffin's Bay, 1818, brought up specimens from 1050 fathoms with a "deep-sea clamm," invented by himself; and the late Rear-Admiral Chas. H. Davis, U.S.N., had in 1845 brought up greenish mud from 1350 fathoms, in the North Atlantic, using a Stellwagen lead, called a "cup-lead" in the English service, and the invention of Lieut. Stellwagen, U.S.N. These were non-detachable leads, however, and would not work in the deeper water. Some four years after Brooke's invention,—1857,—Lieut. (now Rear-Admiral) B. F. Sands, U.S.N., brought forward another ingenious detaching apparatus which has been preferred by some workers to that of Brooke. The Sands cup, indeed, has long been in use both in the naval service and Coast Survey.

The next important departure in deep-sea work was the equipment—at the instance of Mr. Field and associates, 1856—of the first steam-vessel fitted for such purpose,—the U. S. S. "Arctic," under Berryman's command,—for the surveying of the route for the proposed submarine cable. The "Arctic" was fitted with a steam-reel, which held 10,000 fathoms of line an inch in diameter, and the sounding was done from the bow. The Brooke was used for bottom specimens; but Berryman modified the apparatus by substituting a conical lead-sinker, weighing from 100 to 150 pounds, for the round shot. Massey's self-registering machine was used as a check on the line for vertical depth instead of noting the time-intervals of descent.

This machine is simply a small brass propeller fixed in a protecting metal frame, which, in descending, turns by action of the water, communicating its motions to the indices of several dial-plates marked in units, tens, and hundreds of fathoms, and so on. The machines furnished

the "Arctic" had their dials improved by Mr. Saxton, of the Coast Survey, to register 21,000 fathoms without re-adjustment. Similar machines had been made by M. Lecontre, Walker, and Trowbridge; but their use, except in shoaler soundings, has been abandoned, owing to doubtful results in deep water and their liability to get out of order. Berryman, however, instanced one cast in 2070 fathoms, as indicated by the "Massey," where only 2150 fathoms of line ran out; and, as the Brooke brought up a specimen, there could be no doubt of the value of the sounding as things went then.

The "Arctic" was twenty-two days in crossing the Atlantic from the banks of Newfoundland to the Irish coast, making 24 casts in all, the deepest of which was 2700 fathoms.

The soundings had sometimes to be repeated owing to breakage of the line, and two hours was the average time occupied at each cast.

Notwithstanding this good work, the discarding of the use of time intervals, carelessness in preparing profile chart of the bottom, and the publication of the results in England before report was made to the Navy Department, engendered differences—personal and official—between Berryman and Maury, which led the latter to so discredit the "Arctic's" work as to cause the British Admiralty to detail H. M. S. "Cyclops," Lieut. Dayman, R.N., to make a supplementary survey. Dayman had similar appliances to those used on board the "Arctic," but discarding the quills, fitted a valve in the specimen cup, and substituted wire for the rope or cord slings originally designed by Brooke. Brooke subsequently modified the rod so as to have only one trigger, insuring more certainty in its working. The same route was gone over, and the 34 casts made substantially agreed with those made by Berryman. The "Cyclops's" deepest cast was 2424 fathoms. Maury was obliged to accept the results of this survey, though it interfered with a theory he had put forth in his "Physical Geography of the Sea," "that there is at the bottom of this sea, between Cape Race and Cape Clear, a remarkable steppe, already known as the telegraphic plateau, . . . and the sea is probably nowhere more than 10,000 feet deep," whereas the depth was found to be considerably greater, and the bottom not so regular as had been thought. In fact, the so-called plateau is not so uniform in contour as the bed of the Pacific between San Diego and the Hawaiian Islands, or from Cape Flattery, across the Gulf of Alaska, to a point near the Aleutian chain.

Subsequently, Dayman, in the "Gorgon," sounded another route *via* the Azores, using non-detachable sinkers weighing 188 pounds, and stout albacore line, which he cut on reaching bottom. Then followed Sir Leopold McClintock in the "Bull-dog," who, in 1860, sounded on a more northerly route than either of the others. Sir Leopold adopted the novel plan of first finding the depth with stout cod-line and iron sinkers of 100 pounds, which he cut away on reaching bottom; then sending down with stouter line for specimen a detachable lead of clumsy construction, known as the bull-dog machine. Other British officers took part in these surveys in the North Atlantic, notably Capt. Hoskyn in the "Porcupine" and Lieut. Johnson in the "Greenwood."

Meanwhile, Brooke had been testing his apparatus satisfactorily in the North Pacific, in depths ranging from 2000 to 3400 fathoms. His first experiment was in January, 1854, sounding from one of the "Vincennes's" boats, using fifteen-thread twine .07 inch in diameter, and sinker—a shot—of 40 pounds weight. It was an anxious day for the enthusiastic inventor, but everything worked smoothly, and he had the great satisfaction of leaving the shot on the bottom, and bringing back a specimen from 2150 fathoms,—the first soil that delighted the eyes of the persistent seeker from so great a depth. Four years later, and now a lieutenant, and in command of the schooner "Fenimore Cooper," he continued his experiments in the same ocean.

Following up some extended and suggestive experiments by Capt. F. Spratt, R.N., made in the Mediterranean, 1857, of weighing the line when the lead was thought to be on the bottom, and tested by Trowbridge's demonstration of the laws governing the descent of line in water, Brooke deduced a rule of *standard casts*, which led to very accurate results, as is now put beyond question by the close approximation of the "Cooper's" soundings to those of the U. S. S. "Tuscarora" in the same region of the Pacific, between California and the Hawaiian group, and establishing beyond doubt the superiority of his apparatus to that of any other invented up to that time for measuring the depths; indeed, all other contrivances for leaving the sinker behind and bringing up specimens of bottom soil—and there have been many—may be said to be modifications of the Brooke apparatus.

The next extended and important exploration of the depths was made in 1868 by Capt. (now Rear-Admiral) F. P. Shortland, R.N., in H. M. S. "Hydra," who was ordered by the Admiralty to survey a cable-route from Aden across the Arabian Sea to Bombay. Shortland seems to have had a genius for deep-sea work, and his ship was undoubtedly better equipped for the purpose than any vessel hitherto engaged in such service.

The modification of the Brooke apparatus, known as the "Hydra" machine, and improved by Staff Commander Baillie, R.N., is now the favorite machine in the British service. "The original machine," says Capt. Shortland, "was a combination. Her blacksmith, Gibbs, invented the detaching spring; a tube used by Capt. Spratt when sounding in the Mediterranean suggested the tube part. The piston was a contrivance of mine in order to lessen the shock of the strike in hard bottom, and to prevent the machine from turning over on its side, in which case the suspending wire did not slack sufficiently to be disengaged." One admirable feature of the "Hydra" is that the sinker consists of several iron disks of an average weight of 100 pounds each, "toothed and notched," so as to form a compact mass when put together. The obvious advantage is that the weight can be increased or diminished at pleasure. The tube for specimen and bottom water passes through the sinker, as in the Brooke, and is divided into four chambers fitted with valves opening upward, the lower end having a butterfly-valve. In the upper chamber travels a piston, carrying a rod, to which is bent the sounding-line. The slings of the sinker depend from a stud projecting from

the upper end of the rod, and an arched steel spring, with a slit directly over the stud, is fastened to the rod longitudinally, the ends having play so that the spring can be readily pressed inward. When the sinker is suspended the spring is pressed in, and from the stud, now outside the spring, the slings are hung, the weight holding the spring back.

Commander Baillie's modification does away with the stud and spring, and substitutes a sliding "catch," the bight or loop of the slings passing over it, and when bottom is struck the "catch" drops over a conical end, the slings fly off, releasing the sinker. Shortland seems to have made the first use of the accumulator to relieve sudden strain in a sea-way and to indicate roughly the amount of strain as the line runs out. This consists of two-score or more of rubber springs rove through stout wooden disks, placed two or three feet apart, with appropriate fastenings. The lower end of the accumulator is fastened to a short pendant hooked into an eyebolt in the deck, and to the upper end is spliced a longer pendant, passing through a fair-leader on the sounding-derrick, and having a block turned in at its other end, through which the sounding-line is rove. The upper pendant is fitted long enough to permit the accumulator to stretch more than double its length, but arranged to keep it within breaking limits.

The sounding-lines of the "Hydra" were of Nos. 1, 2, and 3, wound on a reel commanded by a brake, and in all the later work of the vessel the descent of the line was retarded. Capt. Shortland was perhaps the first to enunciate the idea "*that a sounding line should not be permitted to run free, but should be resisted by a force equal to the weight in water of a length of the line equal to the depth to be determined.*" Then noting the time intervals the problem seemed easy of solution.

The "Hydra" was a paddle-steamer, and in sounding was kept before the wind, the line running down from the stern,—a method first tried by Capt. Spratt in the Mediterranean. The sinkers weighed from 200 to 400 pounds, according to expected depth. The deepest water found in the Arabian Sea was 2160 fathoms, but a cast made in the South Atlantic gave a specimen from 2830 fathoms. Prof. Sir Wyville Thomson, in his "Depths of the Sea," describes a sounding made from the "Porcupine," Capt. Calver, R.N., in 2435 fathoms, which he considers as "probably the deepest sounding up to that time which was thoroughly reliable," but Brooke's work, long before, in the Pacific, in much deeper water, has been proved to be perfectly reliable, nor is there reason to doubt the results obtained by Ross twenty-nine years previously; and Capt. Shortland, in a note to the writer, says, "If Sir Wyville Thomson had been with us on the 21st August, 1868, when we took our last sounding in the Bay of Biscay,—2600 fathoms, with bottom water, and gray sand and shells brought up,—he would probably have considered it reliable. We all thought it perfectly so, and I inserted it on the Admiralty chart. The 'Porcupine' ought to have had and no doubt did have it on her chart, as well as some copies of the 'Hydra's' sounding voyage on board, and it is strange all this should have escaped the professor's notice."

The writer, when ordered to do similar work in the Pacific, derived much information from the "Hydra's" published report, and an impartial examination of extended deep-sea work up to the advent of the "Challenger" and "Tuscarora" expeditions, will award the palm for accuracy, originality, and inventive grasp to Brooke and Shortland.

The genius of Brooke in devising the apparatus for bringing up specimens of bottom soil, delighting the eyes of the earnest seekers and lending fresh interest to the revelations of the microscope, in the variety and richness of new forms disclosed, but whetted the appetites of the naturalist and geologist, and, like Oliver of the story, they cried for more, or for larger specimens than the quills and cups would bring up; and the dredge, which had hitherto been regarded as only practicable for gathering up the fauna of the shoaler water along the coasts, was improved for the exploration of the wider, nay, illimitable fields of the "abyssal regions" where the darksome organisms, biological milestones under the waters, had lain hidden from the creation. Marine zoology became suddenly invested with fresh and surpassing interest, and, says Prof. Verrill, "Dr. Wallich led off in this new era,—1860,—establishing the fact that the deep sea had its own peculiar fauna at depths far greater than life had previously been supposed to exist, unless in the lowest forms, such as the Rhizopods." Milne-Edwards confirmed these observations—1861—"in finding living mollusca and corals adhering to telegraph-cable in the Mediterranean," which had been hauled up from a depth of 1577 fathoms for repairs. The same year followed the "Swedish expedition to Spitzbergen, and the extensive explorations of Prof. Sars at the Loffoden Islands and on the Scandinavian coast in depths down to 450 fathoms;" but the first more extended and systematic dredging expedition was conducted by Count L. F. de Pourtales, under the instructions of Superintendent Peirce of the U. S. Coast Survey, begun in 1867 and continued until 1869. These explorations were made in the Florida Channel of the Gulf Stream, and extended to depths of 700 fathoms with great success, resulting in the obtainment of "large and remarkable collections embracing numerous representatives of nearly all classes of animals." The first season's work was interrupted by the advent of yellow fever on board, but enough was done "to disclose the interesting fact," says Pourtales, "*that animal life exists at great depths in as great an abundance as in shallow water.*"

This first year's exploration of Pourtales, so short, yet so rich in its yield of new forms, and so important in the grand fact of nature established, undoubtedly "stimulated to a great extent," says Mr. Alexander Agassiz, "the English expeditions of the 'Lightning' and 'Porcupine,' in 1868, 1869, and 1870," which were fitted out by the Admiralty at the solicitation of Dr. W. B. Carpenter, Mr. Gwyn Jeffreys, and Prof. (now Sir) C. Wyville Thomson.

The "Lightning," Commander May, R.N., used for specimens the Fitzgerald machine, an apparatus with detachable sinker, devised for large quantity, but of heavy, unwieldy construction and uncertain in its working. The "Porcupine," Capt. Calver, R.N., was equipped

with sounding apparatus similar to that used by the "Hydra,"—for in dredging the depth must first be found, to do the work intelligently,—and supplied with appliances for trawling and dredging, improved as the experience of the "Lightning" had suggested.

The great achievement of these cruises was the successful dredging in 2435 fathoms in the Bay of Biscay, July 22, 1869; an unparalleled feat up to that time. The machine with which the preliminary sounding was made was the "Hydra," weighted with sinker of 336 pounds, and the line of Italian hemp, with circumference of 0.8 inch. "The line was given off the reel as fast as the weight would take it, so there might not be the slightest check or strain." Capt. Shortland's method of resisting the descent of the line in some measure, was abandoned,—an undoubted mistake. The voyages of these two vessels yielded such happy results that the distinguished explorers, who had in turn taken scientific direction of the work, sought still further favor of the Admiralty, which resulted in the equipment of H. M. S. "Challenger" for a four years' cruise round the world for the further prosecution of those interesting researches in the great domain of the deep; but of this more anon.

The civil war intervening had interrupted these researches by American officers, and four years of strife made them rusty in deep-sea work. The Coast Survey was the first to re-enter the field, and in 1866 we find the steamer "Corwin," Master Platt, sounding in the Florida Channel, under the direction of Mr. Henry Mitchell, Superintendent Coast Survey. Then followed the U. S. S. "Yantic," Commander (now Captain) John Irwin, sounding for cable-line in the waters of the West Indies and Caribbean Sea. About this period, too, the Coast Survey steamer "Hassler," Commander (now Captain) P. C. Johnson, U.S.N , with Prof. Agassiz on board as passenger, sailed for the Pacific, with instructions to make soundings *en route*. The fittings of these vessels seem to have been crude and clumsy, unsatisfactory in their working, and unreliable in their results; in short, not in keeping with the knowledge acquired, experience gained, and position won by the service prior to the war. The inspiring presence of Professor and Mrs. Agassiz could not counterbalance the fatal defect of rotten lines and other sounding appliances, far inferior to those used by the "Hydra" and "Porcupine," which had been furnished the "Hassler"; and candor compels the admission that the work of English officers at this period was much more satisfactory than that attempted by our own service,—albeit, both the navy and Coast Survey are now in advance, in the writer's opinion, in all that pertains to ease and perfection in deep-sea exploration.

So matters stood until Sir William Thomson brought forward the machine destined to revolutionize deep-sea work, and which it was the lot of our service to put to the test almost before its inventor could perfect its working or demonstrate its success under all conditions and in all depths. Sir William proceeded on the principle that "the art of deep-sea sounding is to put such a resistance on the reel as shall secure that at the moment the weight reaches bottom the reel will stop." Here was the solution in a nutshell: Captain Shortland's practice carried to its legitimate and more perfect conclusion; but the time-interval interpretation was rejected,—the reel was to stop, and does stop the moment bottom is struck, or within a second of time.

The apparatus was first tried, 29th June, 1872, in the Bay of Biscay. "I sounded," says Sir William, "from the 'Lalla Rookh' schooner-yacht with a lead weight of 30 pounds (undetachable), hung by nineteen fathoms of cod-line from another lead weight of 4 pounds, attached to one end of a three-mile coil of piano-forte wire, the lengths spliced and wound on a light wheel about a fathom in circumference, made of thin tinned iron plate. The weight was allowed to run directly from the reel into the sea, and a resistance exceeding the weight in water of the length of the wire, actually submerged at each instant, was applied tangentially to the circumference of the wheel by the friction of a cord wound round a groove in the circumference, and kept suitably tightened by a weight." The experiment was so successful that the inventor did not doubt the solution of the problem had been demonstrated; albeit, the crushing and accumulative force of reeling in had disclosed great weakness in the wheel or reel, which would have to be remedied before the machine could be put satisfactorily forward to do the work required, and which caused much trouble and anxiety in hauling back the wire and lead. Bottom had been reached at about 2500 fathoms, and the stopping of the revolutions of the reel was so sudden and marked that the crew thought something had broken, nor did they feel assured to the contrary until the cup came up filled with soft gray ooze. The wire used was piano-forte wire No. 22, Birmingham gauge, weighing about 14½ pounds in air to the nautical mile, and bearing a strain of from 230 to 240 pounds without breaking. "The great merit of wire," says Sir William, "compared with rope, is the smallness of the area and the smoothness of the surface which the wire presents, in contrast with the greatness of the surface and its roughness when rope with a comparable degree of strength is used."

The "Challenger" was fitting out for her famous cruise around the globe at the time this experiment was made, and, not doubting that "the difficulties which had seemed to make the idea of sounding by wire a mere impracticable piece of theory had been altogether got over," Sir William hastened to lay the result before the Admiralty, and suggest the use of the apparatus in the expedition. Its use was declined, however, "until the machine could be perfected," and Capt. (now Sir George) Nares seems to have acquiesced in that decision. Nevertheless the ship was supplied with the original machine and wire, and their working explained by the inventor to the executive-officer, Commander Maclean, R.N. The inventor, too, had, "as one of the committee of the Royal Society, been invited to make suggestions with regard to scientific matters connected with the expedition." Yet the practical suggestion he offered for consideration was neglected, and the vessel proceeded on her unmatched errand, equipped with every instrument and appliance that art and science, mechanical skill, and seaman's experience could devise or suggest, and yet discarded the use of the incomparable machine that could

not only have rendered her work more accurate, but would have lessened the labors of the cruise more than one half, especially if wire rope had been used for dredging, which the beautiful working of the wire in sounding would naturally have suggested. The line used by the "Challenger" was of the best Italian hemp, and the No. 1 size—mostly used—was one inch in circumference, with breaking strain of 14 cwt.

This, coupled with the fact of the use of heavy sinkers,—400 pounds weight in deep casts,—was a great help in the matter of easy and accurate working, but not comparable with the facility and perfectness of action of wire only 0.028 inch in diameter, or considerably smaller in size than the wire used for ladies' hair-pins. The time-interval method was used, and be it remembered, that was the only means the experts of the ship had of interpreting the arrival of the lead on the bottom. The sounding was done from the gangway, the vessel kept head to wind and sea, the line marked at every 25 fathoms was kept on reels on the forecastle, "and," says Navigating Lieutenant Tizard, "the weights are allowed to take it freely as they descend; the reel occasionally moves faster than the weights take the line, and consequently there is a danger of its fouling; to prevent this one end of the reel has a circular disk of wood attached to it like a large sheave, over this a gasket is placed and a man stationed to attend it; should the line unreel faster than the weights take it, he is able to check it at once by tightening the gasket. From the reel the line is led aft through a block to the engine, then up through the block at the mainyard and down to the water," with the "Baillie-Hydra" rod and sinker, as well as water-bottle and thermometer attached for specimen of bottom water and bottom temperature. "The sounding alone," continues Tizard, "at a depth of 2500 fathoms occupies three hours (including heaving in the line), the dredge requires three hours to sink, one hour at the bottom, and three hours to heave in." Compare the three hours occupied by the "Challenger" in making a cast at 2500 fathoms with the average of one hour, twelve minutes of the "Tuscarora's" time in getting answer from that depth, and what a saving of time results!

The "Challenger" put to sea December, 1872, and a few months later, or in April, 1873, the U. S. S. "Tuscarora," under the writer's command, then serving in the South Pacific, was ordered to San Francisco to prepare for the special duty of "making soundings between the western coast of the United States and the east coast of Japan for scientific purposes, and for the purpose of determining the practicability of laying a telegraph-cable between these shores." As has been seen, neither the naval service nor the Coast Survey had recovered the ground lost during the war in deep-sea work, and the appliances in use were not comparable to those supplied the "Challenger." But all this was soon to be changed, and the forefront in adaptive equipment and skilled use of appliances was to be resumed. Commodore (now Rear-Admiral) Daniel Ammen, himself an inventor, with broad and sympathetic views concerning the testing and the introduction of new inventions of practical promise into the service, was chief of Bureau of Navigation, and, regardless of the action of the English Admiralty, and despite the discouragement received in quarters where he had reason to look for more practical views, he ordered one or more of the Thomson machines and a supply of wire as soon as he heard of the promising experiment in the Bay of Biscay. The machine was still in an imperfect state, but the chief of bureau gave no heed to that; he knew that while genius conceives, creates, the less brilliant mind can improve and modify, and that the spirit of our service is second to none in its welcome to new ideas, and in its earnest, persistent effort to improve upon them.

The modest little Thomson machine in its snug iron tub and 180-pound package of wire seemed absurd in contrast with the heavy iron reel and dynamometer, donkey-engine, and the forty-odd miles of rope, of varying sizes, supplied the "Tuscarora"; but, like David and Goliath of sacred story, the little drum, which with four miles of wire weighed hardly 130 pounds, was, as steadily improved, to be the easy victor.

The machine simply consisted of a hollow drum of thin galvanized iron, a fathom in circumference and three inches wide, revolving on an iron shaft. The disks forming the sides were enough larger than the drum to form rims, like the rim of a car-wheel, two or more inches deep, and a third rim projected from one side forming a V-groove; on one side of the shaft a ratchet-wheel was fitted to receive a pawl, and the other had a wormed brass wheel by which its motion was communicated to the cog-wheels of a counter, having three dials to register the revolutions. The shaft, fitted at each end for cranks, revolved on metal standards bolted to a stout oak plank 3½ feet in length and 15 inches in width. The weight of the drum, including the shaft, was hardly more than 60 pounds. The dynamometer-wheel revolving in an iron crotch, was placed in rear of and close to the drum, and in a line with the V-groove; it had one groove in its rim wide enough to take two parts of rope, and another much narrower, to receive a cord. The dynamometer was simply a spring balance with scale and index hand, fastened to the bed of the machine, and connected with the dynamometer-wheel by a cord which lay in the narrow groove of its rim, and passing down through a hole in the wheel, was made fast to the rod attached to the springs of the dynamometer. Now any strain brought to bear on the dynamometer-wheel to make it turn would be indicated on the scale by the pointer.

When making the machine ready for use, an endless rope of the proper size—soft albacore line was used on board the "Tuscarora"—is placed in the V-groove of the drum, and the lower part or bight is placed over a grooved iron pulley-wheel and kept taut by means of a pendant run through a stationary block, the lower part of the pendant having a number of hooks from which to suspend weights of different sizes as required. The machine, as received, was fitted with a tackle to tauten the endless rope; the pendants and weights were substituted after the first trial of the apparatus at sea. It will be understood that the endless rope runs freely round the V-groove as the drum turns, but being kept taut, the friction of the line restrains the action of the drum, and passing round the dynamometer-wheel communicates the amount of tension on the wire to the dynamometer, which

is at once shown on the scale by the movements of the pointer. *Now bearing in mind that, when sounding, the resistance applied frictionally is always to be in excess—say by ten pounds—of the weight of the wire in water, of the amount out at every moment of the sounding, it follows that when bottom is struck the reel or drum will stop, for, released from the weight of the sinker, the descent of the wire is now restrained by a force greater than the weight of the wire out, and must stop and does stop almost instantly.* As the weight of the wire in water is hardly more than 12 pounds to the 1000 fathoms, it is a very simple matter to know what resistance to apply from time to time, by watching the counter which registers every turn of the drum. On board the "Tuscarora," working in deep water, it was the practice to restrain the wire considerably at the beginning of a cast, then to take off most of the weights applied to the dynamometer, and let the wire run freely. As bottom was thought to be neared, the proper weights were restored, always with the happiest results.

The inventor's idea had been to haul back a 30-pound lead with valve-cup for specimen; but this imposed extra labor, besides bringing unnecessary strain on the drum—already too weak—as well as on the wire; and, in fact, was not in keeping with the other features of his apparatus nor the ideas of deep-sea work at this stage. Sir William himself subsequently adopted the use of detachable leads. A lot of Brooke rods supplied the ship were fitted with a modification of the Sands cup, but their stems were so slight they often broke off in use, and the specimen brought up was small. The rod itself when properly constructed seemed to be the best detacher yet devised: simple, easily made, and as sure in its working, when properly handled, as anything made by man can be. There was no need to go outside our own service for any other device; the only thing needed was an improvement looking towards the bringing up of a larger specimen, and to go with a heavier sinker than the 32-pounder shot.

After much experiment both at sea and in port, three different cups or cylinders, 2¼ inches in diameter, were devised to go with 8-inch shot bored through to receive them, which subserved the purpose satisfactorily; the No. 2, as was expected, proving to be the best for general use. The weight of the bored shot was 55 pounds, but in depths beyond 3000 fathoms a heavier sinker was found advisable, and a lead casting of 15 or 20 pounds' weight was added when working in the deeper water. New rods were made and forged as lightly as possible consistent with strength, so that the weight to haul back would be no greater than absolutely necessary, the advantage of which precaution was readily seen when working in depths of 4000 fathoms and upwards.

When the fittings of the ship were completed a short run was made outside the Heads of San Francisco to test the apparatus and appliances, and familiarize the officers and men with their working. This experimental trip at once demonstrated the superiority of wire over rope for the purpose in hand; but the drum proved to be too weak for the strain imposed upon it, and other defects were disclosed, which had to be remedied before the ship could proceed with confidence on her mission. Meanwhile, Sir William himself was experimenting with the machine, endeavoring to correct faults of construction and improve its working, so that it would stand the demands likely to be made upon it. His idea was to retain the original lightness of the drum and keep down its inertia, and he devised an auxiliary pulley fixed to the bed of the machine, with a castor-pulley to receive the wire from outboard in coming in. Cranks were fitted to pulley and drum, so that either two or four men could work them, and the wire was so led over the castor-pulley and round the auxiliary pulley that the drum was relieved from two-thirds to nine-tenths of the strain originally imposed upon it. He also did away with the dynamometer and its wheel, which had been fitted to the machine furnished the "Tuscarora," and went back to the simple friction-brake, such as he had used in the Bay of Biscay, but now controlled by weights, which could be put off and on at pleasure as the depth required.

The method pursued on board the "Tuscarora" was in the direction of preserving the features of the simple reel and dynamometer. The experimental cruise and all subsequent experience demonstrated the fact that the weight could be increased to 250 pounds, if necessary, without affecting the sensitiveness of its indications, and there was no time to dream and ponder over radical changes; the work was laid out and seasons would not wait; it was expected that the survey would proceed with the means already in hand, and every effort was bent towards strengthening the drum in its original simplicity. The drum which had been badly crushed in the experimental cruise was restored in outline and strengthened, and a new one made of heavier iron, with wider face to give more room for the wire. The new reel would easily carry six miles of wire; the V-groove was deepened, and the wide groove in dynamometer-wheel widened to lessen the probability of the endless rope flying out in rapid working. The heavy iron reel and dynamometer which had been placed on the topgallant forecastle for sounding with rope, was also improved as experience had suggested, and other modifications in the appliances which the trial at sea had seemed to make imperative.

The ship now put to sea to begin the work assigned,—of running a line of soundings from Cape Flattery to Yokohama, Japan, *via* the Aleutian Islands; and after a reconnoissance in the waters of Puget Sound for a suitable place to land a cable, departure was taken from Cape Flattery, September 17, 1873.

Lieut.-Commander T. F. Jewell was assigned charge of the heavy reel forward and an extra wire apparatus for taking serial temperatures; Lieut. G. A. Norris was given the management of the Thomson machine, operated in the gangway; selected petty officers acted as assistants, so that the machines were always attended by the same persons, who gaining experience all the while came to know how to meet every phase of difficulty attendant upon the ever-varying conditions at sea; for simple as is the working of the wire machine, "personal equation" should not be overlooked, as great care and attention to details is necessary, and the apparatus needs to be managed as deftly and

carefully as a sextant or chronometer to make sure of good results.

Intending to sound alternately with the rope and the wire, the use of the former was abandoned after the twelfth cast; it occupied so much more time than wire, though the albacore line used was about the size of the "Challenger's" rope No. 1. It had not near the strength of that carefully-prepared line, however, and was apt to break after two or three casts.

The weather was such that steam had to be used most of the time, and after a run of 1100 miles the ship put back to Puget's Sound for coal. Twenty-five casts had been made with the wire in deep water with marvelous ease, and with the original drum, though now it began to show signs of distress. The last and deepest cast was in 2534 fathoms, and after passing a ridge some 200 miles west of Cape Flattery, the average descent had been a fathom to a mile. The time occupied in the deepest cast was one hour, forty-four minutes. This was good for a beginning, but the "Tuscarora" came to regard a cast of 2500 fathoms as an ordinary matter whatever the state of weather and sea, and with a further saving of half an hour in time.

The season was now so far advanced that the Department ordered the ship to return to San Francisco, sounding *en route* "off and on" to ascertain the true continental outline, a work Prof. Agassiz had long had at heart. Eighty-three soundings were made, and some of the lines extended seaward 200 miles. More abrupt in its descent than the shores of the American North Atlantic, a run off the coast of 70 miles would sometimes show a fall of 2¼ miles.

Complications with Spain threatening war, the ship's battery, which had been taken out of her to make room for extra coal and heavy sounding-gear, was restored, and the heavy reel and great stores of rope were landed. The whole wire apparatus took up little more space than a division-tub, and the ship was now ready to take part either in the stern demands of war, or to continue her beneficent mission of peace. Meanwhile the appliances were improved, and two new drums were made of heavy sheet-iron,—one of them, filled in with wood to help resist the crushing pressure in reeling in; and about the middle of December, the clouds of war having blown over, the ship was ordered to proceed to San Diego, continuing the soundings for "continental outline," and to take departure from that port in running a line across the central North Pacific *via* the Hawaiian and Bonin groups. Fifty-eight casts were made *en route*, the deepest in 2165 fathoms, and the original drum did all the work. The same outline was developed, and a retreat of the waters would show a continent buttressed and bastioned like an immense fortress.

Having filled bunkers and deck with coal, the ship left San Diego, January 6, 1874, and twenty-seven days after anchored in the harbor of Honolulu. Sixty casts had been made, the deepest in 3054 fathoms; the apparatus had worked beautifully, no accident had occurred to dampen the ardor of the surveyors, and the machine, as sensitively perfect at three miles as in lesser depths, showed, whether sounding by night or by day, results equally accurate and indisputable. The action of the dynamometer, the stopping of the drum, the detachment of the sinker and the bringing up of bottom soil, all gave undoubted proofs of accuracy. The original drum supplied, as willing as the little donkey-engine on board the "Porcupine," whose pantings excited the pitying comments of Sir Wyville Thomson in his "Depths of the Sea," had still done much of the work on this line, but was now remanded to the forecastle for the taking of serial temperatures.

During the passage a temporary apparatus was contrived to relieve the crew somewhat in the labor of reeling in the wire, which had hitherto been done, hand over hand, by means of the endless rope; and at Honolulu an iron fly-wheel 400 pounds in weight was cast, to which was fastened a grooved wooden disk to take one bight of the endless rope. The wheel was mounted on standards, placed on a flying-bridge thrown across the ship from gangway to gangway, and cranks were fitted on each end of the shaft, with room for four men to work them. This economized both time and labor, and with the large crew of a man-of-war the writer would prefer it to an engine for the purpose in question. A new reel was also constructed of light boiler-iron, and since experience has shown that the weight of the drum might be materially increased without detriment to accuracy, it was suggested to the Bureau of Navigation that a steel drum might be cast strong enough to withstand any strain likely to be imposed upon it. Such reels are now in use in the service, and Commander W. S. Schley, U.S.N., was the first to thoroughly test one of them in sounding across the South Atlantic in the "Essex," from St. Paul de Loando to Cape Frio. The soundings were about 100 miles apart, several in depths of over 300 fathoms, and the reels stood the test admirably.

The soundings from the "Tuscarora" were made from the gangway,—the ship brought stern to wind and sea, all sails furled except jib, the yards laid as circumstances of wind and sea required, and the vessel, under easy steam, kept in position by working the engines as necessary. Sometimes the heavy sea in the strong trade region would board the vessel over the poop, and soundings were made at times when a well-found ship would stagger under treble-reefed topsails. So continued the work week after week, sounding at night as well as by day, and in all sorts of weather; yet one never tired watching the working of the reel, so noiseless and perfect in its action, and the wire so fine that it could hardly be seen from the poop-deck in cloudy weather or when passing clouds threw shadows over the ship. Sometimes at the approach of evening the writer stood in the cabin doorway watching, in the deepening twilight, the movements of the drum, and could detect instantly the moment of striking bottom, although the revolutions could only be distinguished by certain discolorations on the sides of the drum as they met the eye in passing round. At night, too, the gleams of the lantern flashing on the drum—only needed for the reading of the counter and the noting of the splices — recording the amount of wire out, revealed its motions and indications at the far ends of the ship equally well. One of the supposed drawbacks in the use of wire was in the making of safe splices, but the difficulty was purely imaginary; made with long

jawed twist, two feet in length, the ends and one or two points in the middle lightly soldered, and the whole served with waxed twine, no splice ever failed, nor did any break ever occur at a splice. When a sounding was completed, the machine was unrigged—the work of but a few minutes—and the reel put in a tub containing a solution of caustic soda to preserve the wire from rust. The writer has in possession several pieces of the wire taken from the reels, which, after all the work in sea weather and six years' exposure to the air, show hardly any signs of rust. The under-currents sometimes played strange freaks with what was called the stray-line,—a line of soft rope 25 fathoms in length, placed between the sinker and the end of the wire to prevent the wire from touching bottom; for, relieved from strain, the end of the wire would be apt to fly upward, kink, and break. To prevent the possibility of this, a small lead of 4 pounds weight was made fast to the bend joining wire and stray-line, so that when the sinker struck bottom the wire would still be kept at a tension by this smaller weight. On one occasion when the currents made havoc with calculation, the sinker had to be hauled back from 1900 fathoms; the slings had been freed from the trigger, but the stray-line had taken half a dozen turns round slings and rod and hitched itself, the slings thus lashed to the rod there was no possibility of getting rid of the sinker. To overcome such difficulty a rod of heavy wire a fathom in length was fitted with an eye in each end to go between detacher and stray-line; the idea being that the rod in falling would carry the line clear of the sinker, which device worked to a charm. The first 600 miles from San Diego taking the depth of 1900 fathoms at the beginning of the ocean-bed proper, the depth increases in varying curves 494 fathoms; then a distance of 1050 miles the water deepens only 286 fathoms; the next 500 miles shows a gradual descent to a depth of 3054 fathoms, when, after an intervening ridge 3500 feet in height, the bed suddenly rises to a depth of 937 fathoms 18 miles from the Hawaiian group.

The run to the Bonin group from Honolulu occupied twenty-nine days, and the results were of a most interesting character. The story told by the lead shows that were the waters of the Pacific drained, six mountains, varying from 7000 feet to 12,600 feet in height, would stand revealed between the two groups in bold and rugged outline, clothed on their sides and tops with coral limestone, sand, and lava, and solid rock, with yellowish-brown soil in their valleys. Fifty-nine casts had been made, 18 of them in over 3000 fathoms. The deepest water found was 3267 fathoms, and near the Bonins. Twelve casts were made between the Bonins and Japan, the deepest in 2435 fathoms; and Yokohama was reached on the 22d of April, 1874,—a welcome haven of rest after much hard work and anxiety,—and it was a great satisfaction to cable the Department, *via* China and India, that the mid North Pacific line had been completed.

The "Challenger" was now and then heard from, and it seemed strange she did not use the wire for sounding as well as wire rope for dredging. So complete had been the demonstration in favor of wire in the soundings towards the Aleutians, September, 1873, that had the scope of the "Tuscarora" expedition justified dredging, steel-wire rope would at once have been asked for. Such rope is now used in the Coast Survey, and was first introduced on board the "Blake" in 1878, at the urgent instance of Mr. Alexander Agassiz, who, as a mining engineer, had seen the advantages of wire rope so early as 1868, which fact he broached to Pourtales on his return in the "Bibb" from his second expedition to the Florida Channel that year. Mr. Agassiz had also in the winter of 1869 asked the attention of Prof. Wyville Thomson to the advantages possessed by wire rope over the heavy hempen lines, but the "British navy men" interposed the objections of want of pliability, the liability to kink and break, and so on, as they did later in the case of wire for sounding, forgetting that careful management, more than repaid by the results obtained, readily overcomes all such imaginary difficulties. Mr. Agassiz himself first tried the wire rope on a small scale dredging from a boat off Nahant in 1871.

The wire rope first supplied the "Blake" was of galvanized steel, 1¼ inches in circumference, with hemp core; its breaking strain, 8600 pounds. Economy of space was gained as well as a great saving of time and labor, enabling several hauls of the dredge to be made in a day, "while in the 'Challenger,'" says Mr. Agassiz, "the best part of the day was generally consumed in making a haul at a depth of 1500 fathoms."

While resting the crew and waiting the advent of summer at Yokohama before proceeding to finish the northern line of soundings, new drums of still heavier boiler-iron were made, strengthened by every device that experience and skill could suggest; for practical as were the results of the expedition, the work of the cruise was experimental from beginning to end, and at no time during the survey was the need of best appliances more necessary than on the homeward route *via* the Aleutians.

Yokohama Bay was left on the 9th of June, and two days later, and at a distance of only 100 miles from the coast, the depth indicated was 3427 fathoms, the water having deepened 1833 fathoms in a run of 30 miles. The next cast was still more startling, when at 4643 fathoms the wire broke without bottom having been reached; it was in the Kuro Siwo or black stream of Japan, and the current so strong that the wire, in spite of all that previous experience in management could suggest, was swept under the ship, finally parting under the strain. The purposes of the survey and amount of wire on hand would not admit of continued experiment, nor was it believed a cable could be laid in such deep water encountering so strong a current. Therefore the ship was headed in shore to run up the coast and begin a new line. The great circle towards Tanaga, of the Aleutian chain, was taken up again in lat. 40° N., but here the water deepened markedly, and at the third cast from the initial curve of departure the lead sunk to 3493 fathoms, followed up by depths of 3587 fathoms and 3057 fathoms 40 and 80 miles farther on. Then, in the next 40 miles, the bed was found to drop to the extraordinary depth of 4340 fathoms, and the Miller-Casella thermometer for bottom temperature came up a perfect wreck! The next six casts were in 4356, 4234, 4120, 4411, and 4655

fathoms respectively. Good specimens had been brought up from four of these depths, and in one other the cup had struck solid rock. At the last two and deepest casts the wire had parted; in the first instance the accident was due to carelessness in reeling in, but in the last and deepest cast the wire fairly pulled in two, being part of a new batch not so strong as the wire originally furnished. In view of these losses and the remarkable depth developed, it was determined to run back to Hakodadi for a fresh supply of coal; then to skirt the Kuriles for some distance before heading over for the Aleutians. These deep casts had been made under exceptionally favorable conditions,—light wind, smooth sea, and gentle swell. No plummet could have dropped straighter into well than the wire ran down in these four- and five-mile depths; and the indications of the dynamometer were as wondrously perfect as ever. There could, indeed, be no mistaking the moment of touch, and the demonstration seemed clear and indisputable that any system of showing when bottom is struck, based on intervals of descent, must be crude and unsatisfactory as compared with the perfect and unmistakable indications given by the Thomson apparatus and wire. These are the deepest soundings yet made, and the one in 4120 fathoms occupied but $1^h\ 47^m\ 42^s$ from beginning to end.

The "Challenger" subsequently made one cast in 4475 fathoms between the Caroline and Ladrone Islands, bringing up a bottom specimen, the only depth in over 4000 fathoms she sounded during her voyage of four years. "Of this cast," says Lieut. Campbell, R.N., "we had to sound twice to make sure, as the weights were not sufficient in this case." Concerning these deep soundings, Dr. Wild, of the scientific staff of the "Challenger" expedition, says, in his "Thalassa," "that the greatest of all depths of which we have reliable evidence was found by the 'Challenger' on the 23d of March, 1875, in lat. 11° 24′ N., lon. 143° 16′ E., and amounted to 4475 fathoms, or about five miles and a quarter. Several soundings exceeding 4000 fathoms were obtained by the 'Tuscarora' to the eastward of Niphon and Yesso, and another close to the most westerly of the Aleutians. Two of these soundings are over 4600 fathoms, but as it appears that no sample of the bottom was brought up, there is no evidence of the bottom having been reached." Lieut. Campbell and Mr. Spry both give the same opinion in their entertaining volumes descriptive of the "Challenger's" cruise; and now Dr. Carpenter comes forward with an article on the "Deep Sea and its Contents," in the *Nineteenth Century* magazine, in which he says, "the deepest *trustworthy* sounding yet made was in 4475 fathoms, from the 'Challenger.'" What are the facts, remembering that not one of these gentlemen has ever seen the Thomson machine operated? Plainly that, using the time-interval method at great depths, the soundings can never be regarded as satisfactory unless a sample of bottom is brought up; but that working with wire and the Thomson apparatus, there can be no more mistaking when bottom is reached, the reel suddenly stopping, pulled back by an irresistible force the instant the sinker strikes bottom, than the emphatic fact shown by the sudden bringing up of a ship in harbor when the anchor is let go. The chain might snap, but there would be no doubt the anchor struck bottom. In short, here was a machine, the invention of a distinguished British scientist, which the conservatism of British officers rejected without trial, being operated with the happiest results on board an American cruiser, yet having the indisputably good work achieved, questioned, and denied by the same spirit of prejudice and conservatism which was content to rest under the delusion that no advance could be made over the time-interval method, using rope and letting it run freely from the reel. "But," said Sir Wyville Thomson, director of the Civilian Scientific Staff, and the master-spirit of the "Challenger" expedition, in an address before the Asiatic Society of Japan, June, 1875, "since we started Capt. Belknap has sent me an extraordinary series of soundings, which none of us have the slightest doubt of being absolutely correct, which give depths with which we were previously unacquainted." And in a note to the writer he further says, "Of course now none of us would dream of anything but wire for either sounding or dredging." To these opinions may be added the fact that the Geographical Society of Berlin has officially accepted the "Tuscarora's" work as being "the deepest sea measurement on record." Were the lists to be entered, indeed, as to the question of accuracy as between the soundings of the "Challenger" and the "Tuscarora," there would be little doubt in the minds of those who had seen the working of both rope and wire in deep water as to their verdict.

Hakodadi was left on the 30th of June, and skirting the Kuriles until latitude 48° N. was reached, the course was laid across to Aggatou, of the Aleutian group. Deepening rapidly again, a depth of 3754 fathoms was found about 110 miles east of Cape Lopatka, whence the bed rises and forms a ridge between that point and the Aleutians, like the "Dolphin Rise" in the Atlantic, the trough next the latter group having a depth of 4037 fathoms. Arrived at Tanaga Island, a survey was made of Glory of Russia Bay, then the line was continued on through Behring's Sea to Oonalaska, where mails and coal were awaiting the ship. After a stay of nine days the ship put to sea again, and on the 21st of August the survey was completed, and all sail crowded for San Francisco.

Another deep trough was developed by the soundings to the eastward of Ooneemak Pass, in the Gulf of Alaska, running parallel with the Aleutians, in which the greatest depth found was in 3664 fathoms, and which presumably continues along the whole Pacific side of the chain.

When the experience of the "Tuscarora" had established beyond cavil or doubt the feasibility of using wire for soundings, the Coast Survey took it up, and Lieut.-Commander C. D. Sigsbee, U.S.N., commanding the "Blake," set about to master its details in earnest. Sigsbee was fortunate in having ample time for his experiments, and the earnest co-operation and support of the superintendent of the Coast Survey, Mr. Carlisle P. Patterson. Sigsbee invented a bottle for bringing up specimens of water from the bottom, the construction of which would do credit to the genius of an Edison, and, besides remodeling and improving the appliances for dredging, rendering those used by the "Chal-

lenger" practically obsolete, he made a sounding-machine on the principle of the Thomson apparatus, but differing from the constructive ideas of Sir William and the methods of the "Tuscarora." His machine is now exclusively used in the Coast Survey; but, whatever the advantages claimed for it over the original machine as improved, it is considerably more expensive and cumbersome than the simple steel reel supplied our ships of war by the Bureau of Navigation,—inexpensive, portable, taking but little room for stowage, readily put together, easily manipulated, and as perfect in its working at 4600 fathoms as at 100 fathoms. The simpler the machines and instruments, and the fewer the parts of their mechanism for use on shipboard, the better. The idea of Sigsbee was to eliminate "personal equation" in the use of the apparatus,—*i.e.*, to make a machine that would work without fail, however carelessly handled,—a thing exceedingly difficult to do, as the factors of "personal equation" unconsciously enter into every incident and effort of human life and affairs, controlling the methods of success as well as dominating the causes of defeat. Sigsbee claims in brief the following-named advantages for his latest improved machine, viz.:

"1st. To have the effect of a *dynamometer* to make known the strain on the wire at all times in reeling-in.

"2d. To have the effect of a governor on the action of the reel when the vessel is rolling or pitching.

"3d. To get an automatically increased resistance on the reel—to stop it—at the instant of getting bottom. (The original reel does this in accordance with the main intent of the machine.)

"4th. To get a record of the amount of wire paid out, so as not to require interpolation.

"5th. To apply resistance to the reel, without using the inventor's unhandy lead or iron weights.

"6th. To get generally a machine which is easier of manipulation than the original Thomson machine."

The Sigsbee machine works admirably, and for vessels constantly engaged in hydrographic work it is perhaps better adapted for their use as permanent fittings than the more simple reel used by the cruisers; which reel, simple as it is, speaks for itself in the work of the "Tuscarora," "Narragansett," "Gettysburg," "Essex," "Wachusett," "Alaska," and "Saratoga," in the most extended deep soundings on record.

Sigsbee himself made from the "Blake" 958 soundings with wire in the Gulf of Mexico and Florida Channel; 203 were in 1500 fathoms and upwards, and the deepest in 2119 fathoms. Commander John R. Bartlett, U.S.N., commanding that vessel, made in the winter of 1878–79 in the Caribbean Sea and passages 664 wire soundings,—the deepest in 3138 fathoms, but a great proportion of them in less than 1500 fathoms.

In running the two lines across the Pacific and in making the soundings for "continental outline," all of which was done before the "Challenger" entered the North Pacific, the "Tuscarora" had traversed 16,600 miles of ocean and made 483 casts, while the "Challenger's" soundings during her four years' voyage numbered but 384. One hundred and sixty of the "Tuscarora's" casts were in depths of 2000 fathoms and upwards, 32 in more than 3000 fathoms, and 9 in depths of from 4000 to 4655 fathoms. Shortly after arrival at San Francisco (September, 1874), the writer relinquished command of the vessel to Commander (now Capt.) Henry Erben, U.S.N., who in November of that year sounded from San Francisco to Honolulu, making 62 casts, the deepest in 3252 fathoms. Pretty much the same contour was developed as had been found on the San Diego line, but Erben discovered a submarine mountain about one-third the way across from the coast of California, 11,000 feet in height, its peak of solid rock. Subsequently, Commander J. N. Miller took the ship, and ran a line from Honolulu to Brisbane, Australia, *via* the Phœnix group and the Fejees. He made 107 casts, 18 in upwards of 3000 fathoms, and the deepest in 3448 fathoms. Until recently Commander John W. Philip, U.S.N., has been doing deep-sea work in the vessel off the west coast of Mexico and Central America. So far as heard from his deepest cast was in 2921 fathoms, near Acapulco. Commander Geo. Dewey in the "Narragansett" used the apparatus in his survey of the Gulf of California,—the first officer to sound with wire after the return of the "Tuscarora" from Japan, making a cast in 2000 fathoms in fifty-five minutes to start off with,—and Capt. Geo. Brown in the "Alaska" found no difficulty as a regular cruiser in stopping to sound at the same depth *en route* to the Pacific.

Lieut.-Commander F. M. Green had an interesting experience in the "Gettysburg"—1876—in running a line from the vicinity of Porto Rico, and passing over some of the "Challenger's" work. That vessel had made a cast in 3875 fathoms, the deepest yet found in the Atlantic, some 80 miles north of St. Thomas, and Green got bottom in 3595 fathoms, 11 miles south of the "Challenger's" position, and 3697 fathoms 130 miles north of it. Lieut.-Commander H. H. Gorringe then took the ship, and sounded from the Azores to Gibraltar, discovering an extensive bank of pink and white coral 130 miles to the westward of Cape St. Vincent, the water suddenly shoaling from 2781 fathoms. One of the most important of the lines sounded across the ocean was run by Commander W. S. Schley in the U. S. S. "Essex,"—1877–78,—from St. Paul de Loando, Africa, to Cape Frio, Brazil, *via* St. Helena, in which he made 39 casts, the deepest in 3284 fathoms, the deepest water yet found in the North Atlantic. No accident marred the result of his work; it was admirably done in every respect, and assured the value of the improved steel reel beyond question. The "Saratoga" training-ship (old sailing-sloop), Commander R. D. Evans, U.S.N., has made some soundings with wire, but at what depths the writer is not informed. The latest extensive deep-sea work done by our service was that of the U. S. S. "Wachusett," Commander Byron Wilson, *en route* to the Brazils, October and November, 1879, in that portion of the Atlantic embraced between lat. 42° 19′ N., lon. 42° 34′ W., and lat. 28° 40′ N., lon. 42° 34′ W. Commander Wilson made 41 soundings in all, the deepest in 3284 fathoms. In short, many of our cruisers, besides the vessels detailed for special service, are now furnished with the Thomson apparatus, and have but to seek the depth to

find it; and in time, with international co-operation, the features of the ocean-bed may be almost as accurately delineated as the physical aspects of the dry land; but here "personal equation" steps in, and only those commanding officers interested in the spell of the depths will ever attempt to break the seal for fresh glimpses at the secrets hidden beneath the waters, except under the stress of the most positive orders.

The "Tuscarora" and, presumably, the other ships generally, got the bottom and intermediate or serial temperatures, besides specimens of the bottom soil. Unfortunately, no adequate provision was made for the examination of specimens, which involves much time, labor, and expense, and but little progress has been made in giving results to the world, leaving the "Challenger" a clear field in the promulgation of her discoveries.

Automatic machines have been devised from time to time for finding the depth independently of line, but none of them could be depended upon sufficiently to warrant their adoption. The latest of these, perhaps, is an apparatus recently presented by Sr. Henrique de Lima e Cunha to the Lisbon Academy of Sciences, the principle of which is based on the effects of atmospheric pressure. "It consists of a cone of sheet-copper, having for its base a diaphragm of the same metal, and which screws into the bottom of the cone so that it may be readily removed when necessary. In this movable base there are six small holes, one millimetre in diameter, which allow the ingress of the sea to the interior of the cone; and to the centre of its upper surface there is soldered a vertical wire of pure silver two millimetres in diameter, and which occupies the axis of the cone.

"To prepare the apparatus for use the silver wire is moistened with nitric acid, which results in the production of a thin film of nitrate of silver. The base being screwed on, the cone is suspended by means of a ring at its apex, and sunk by means of two separate weights or stones suspended by cords or chains depending from three rings attached to the perimeter of the cone. To insure a vertical position to the apparatus, and to prevent it from being easily turned from its course, a small float is attached just above the suspension-ring at the apex of the cone. As the apparatus sinks into the sea, the water penetrates into it through the orifices of the diaphragm, and gradually rises in proportion as the pressure increases during the descent; the salt water acts on the thin coating of nitrate of silver on the wire, and turns it perfectly white by the production of chloride of silver as far as immersion has taken place. By this means, therefore, is determined to what height the water has risen in the cone, and consequently what the pressure has been; and from these data the depth to which the instrument has descended is easily determined by simple formulæ. The author suggests that by suspending the lower weight by means of an apparatus which would detach it on striking bottom, the apparatus would ascend to the surface of itself, thus dispensing with the use of a line."

It is to be feared this machine makes better showing on paper than it would in actual practice. Taking into account the inevitable drift of ship, the easy hiding of small objects at sea, and the vagaries of submarine currents, where would one look for the apparatus after its return from a voyage to the depths in 3000 fathoms? Let the wind-tossed balloon answer, for the under-currents would act as potently in the one case as the wind in the other!

When two-thirds of the "Challenger's" voyage had been completed, Capt. Sir Geo. S. Nares, R.N., was directed to return home and assume command of the Arctic expedition which the Admiralty dispatched towards the pole in 1875, and Capt. Frank. T. Thomson, R.N., took command of the "Challenger"; and while the world accords every tribute of admiration and appreciation to Sir Wyville Thomson and his able corps of civilian coadjutors, let it not be forgotten that the labor, care, skill, and responsibility of the *actual* deep-sea work of the expedition devolved upon those able captains, seconded by the untiring efforts of the officers of the ship. "At each of the observing stations of the 'Challenger,'" as succinctly stated by Dr. Carpenter in a paper on "The Deep Sea and its Contents" in a recent number of *Nineteenth Century*, "a sounding was taken for the determination of the exact *depth;* the *bottom temperature* was accurately ascertained; a sample of *bottom water* was obtained for chemical and physical examination; and a sample of the bottom itself was brought up. . . . At most of the stations *serial temperatures* also were taken, so as to enable 'sections' to be constructed, giving what may be called the *thermal stratification* of the entire mass of ocean-water along the different lines traversed, and samples of sea-water were also obtained from different depths. At most of the stations a fair sample of the bottom fauna was procured by means of dredge or trawl, while the swimming animals of the surface and of intermediate depths were captured by the use of a 'tow-net,' adjusted to sweep through the waters in any desired plane. And while the direction and route of any surface-current were everywhere determined by methods which the skillful navigator can now use with great precision, attempts were made to determine the direction and rate of movement of the water at different depths, wherever there was any special reason for doing so." In addition to all this—the special work of the expedition—the usual meteorological and magnetic observations noted and recorded on board every well-ordered ship of war were made.

Extensive as were the "Challenger's" explorations, much unexplored ocean remains to be examined, for while she crossed the North Atlantic twice, between the parallels of 20° and 40° N., and traversed its length between those parallels three times, and ran a line from the Canaries to the Cape de Verdes, thence southwardly to and along the meridian passing close to Sierra Leone, Ascension, and Tristan da Cunha, and crossed the South Atlantic from a point near Sierra Leone to Pernambuco, and from the Cape of Good Hope to Monte Video, she left the heart of the great Indian Ocean untouched, and crossed the Pacific only once and a half, traversing its length in the central and western portions twice between the parallels of 40° north and 40° south latitude respectively.

The lines run by the "Tuscarora" under the successive command of Belknap, Erben, and

Miller, crossed the Pacific three times, and Schley's line, in the "Essex," ran through the heart of the South Atlantic; but much yet remains to be done, and as the great mass of deep-sea exploration has been conducted by Great Britain and the United States, what more appropriate than that our government should dispatch an expedition to match that of the "Challenger," and, entering "fresh fields and pastures new," gather up more threads of the warp and weft of nature for the weaving of the geologist, the naturalist, and the hydrographer?—*Geo. E. Belknap, Captain U.S.N.*

Deep-waisted. A vessel is *deep-waisted* when the poop and forecastle are much elevated above the general level.

De facto (*Lat.*). Literally, from the fact. Used generally to signify what actually is, in opposition to that which has the right to be. See DE JURE.

Degree. The 360th part of the circumference of a circle,—the unit of measure for angles and arcs. See LATITUDE and LONGITUDE.

De jure (*Lat.*). Literally, from the law, by right. Used generally in contradistinction to *de facto* (which see).

Dekoyts. See DACOITS.

Del a bit. Not a bit; a phrase which has been corrupted to "devil a bit."

Del Credere. A percentage on a cargo under particular circumstances of trust. Also, the commission under which brokers sometimes guarantee to the insured the solvency of the underwriters.

Delfyn. The old manner of spelling *dolphin.*

Delivered. When the harpoon has been imbedded in the body of a whale so that the barbs hold fast it is said to be delivered.

Deliverer. An artificer employed in early ships of war in constructing the castles.

Delivery, Outboard. A hole through a vessel's side, at or about the load water-line, protected by a valve, through which the refrigerating water, uncondensed vapor, etc., are ejected from the condenser by means of the circulating-pump and air-pump.

Delivery-valve, Discharge-valve. The valve of a pump through which a fluid is forced by action of the plunger or piston, and which by its action, automatic or otherwise, prevents a return of the fluid.

A valve for regulating or permitting the escape of a fluid from a reservoir.

Delphinus. *α Delphini*, Svalocin. See CONSTELLATION.

Delta. A name given by the Greeks to the alluvial tract inclosed between the bifurcating branches of the Nile and the sea-coast. Rivers which deposit great quantities of matter very often separate into two or more branches previous to their discharge into the sea, thus forming triangular spaces, aptly termed *deltas*, from their resemblance to the Greek letter Δ.

All deltas appear by their section to be formed of matter totally different from that of the adjacent country. They are the creation of the rivers themselves, which, having brought down with their floods vast quantities of mud and sand from the upper lands, deposit them at the margin of the sea where the current ceases.

Demi-cannon. An ancient name for a gun carrying a ball of 33 pounds weight, with a length of from 12 to 14 feet, and a diameter of bore of 6½ inches; its point-blank range was estimated at 162 paces, and its random one at 2000.

Demi-culverin. An ancient cannon which threw a ball of 9 pounds weight, was about 9 feet long, and 4 inches in diameter of bore; its point-blank range was called 174 paces, and its random one about 1800.

Demihag. A long pistol, much used in the 16th century.

Demonstration-ships. Ships kept in a certain state of preparation for war, though on a peace establishment.

Demurrage. A term applied to the detention of a vessel beyond the stipulated or usual time for loading, delivering cargo, or sailing. The compensation due to a ship-owner from a freighter for unduly delaying the vessel in port beyond the time specified in the charter-party or bill of lading. A ship unjustly detained, as a prize, is entitled to demurrage.

Den (*Eng.*) A sandy tract near the sea, as at Exmouth and other places.

Den and Strond. A liberty for ships or vessels to run or come ashore. Edward I. granted this privilege to the barons of the Cinque-ports.

De Nautico Fœnore. Of nautical usury; bottomry.

Deneb. An Arabic word signifying the tail. It is used to designate a bright star in the tail of some of the constellations. Thus *α Cygni* is called *Deneb*, *β Leonis* is called *Denebola*, or simply *Deneb*, and there is also *Deneb Algedi* in Capricornus.

Denmark, Navy of. From the days of the Vikings, when the Danes ravaged the shores of Britain and Belgium, to the present hour, Denmark has always possessed a navy. The shores of the Baltic supply timber in abundance, and the natives of the kingdom are peculiarly adapted to a sea-life. Brave in temperament, of strong, muscular frames, and capable of much endurance and great self-sacrifice, the Danes combine the skill of navigators with the properly combative properties of seamen of men-of-war. But Denmark has not been fortunate in modern times. If not formidable in herself, she has been sufficiently strong to be coveted as an ally of Sweden, Russia, and France. On the first occasion of her confederacy with Sweden and Russia, to curb the naval power of Great Britain, she experienced a heavy check from Sir Hyde Parker, assisted by Lord Nelson. And later, in 1807, when there was reason to believe that Denmark was in alliance with the French emperor to damage the English, the latter sent a squadron to Copenhagen, and in anticipation of the purposes of the Danes destroyed their fleet. Since then no scope for the employment of a navy has presented itself. The hostile movements of Austria and Prussia within the last decade robbed her of the possession of Schelswig-Holstein, but the struggle with the German powers was limited to military operations on the land. But the energy of the government has been unceasingly employed to give strength to the nation by raising up a sufficient navy, and she now possesses a fleet of 30 steamers, 12 of which are ironclads, manned by 2880 seamen, engineers, and officers.

Density (Lat. *densus*, thick). A term used in physics to denote the quantity of matter which

a body contains under a given or determinate surface; for example, a cubic foot. The quantity of matter in any body is called its mass, and is measured by the weight of the body to which it is always proportional. Hence the density of any body is great in proportion as its weight is great and its volume small; or, the density of bodies are directly as their masses and inversely as their volumes. It follows also from the definition that if two bodies have the same volume their densities are directly as their masses or weights; and that if two bodies have the same mass or weight, their densities are respectively in the inverse ratio of their volumes. The density of a body is also proportional to its specific gravity.

Dental. A small shell-fish of the genus *Dentalium.*

Dentalium. A genus of gasteropods having a conical, slender shell, open at both ends.

Dentice. An excellent fish, so named from being well furnished with teeth. It is of the *Sparidæ* family, and frequents the Adriatic.

Department. A part or branch of the government; as, the legislative, the executive, and the judicial. Also, a part or branch of the executive power; as, the Department of State, of the Navy, etc.

The heads of the principal executive departments are the Secretary of State, the Secretary of the Treasury, the Secretary of War, the Secretary of the Navy, the Secretary of the Interior, the Postmaster-General, and the Attorney-General. These, by custom, constitute the President's cabinet. They are appointed by the President, by and with the advice and consent of the Senate, and are removable at pleasure.

Military Departments are territorial divisions embracing several posts; as, the Department of the East, of the Platte, etc.

Departure. The easting or westing made by a ship, or the distance in nautical miles which a ship makes to the east or west.

When the two positions are on the same side of the equator and do not differ very much in latitude, the departure is practically equal to the distance between the two meridians, measured on the parallel of middle latitude.

The departure is connected with the course and distance by the relation, *departure* = *distance* × *sin. course.* When the ship steers due east or due west, sin. course is equal to 1, and the departure is identical with the distance; when the course is due north or due south, sin. course is equal to zero, and the departure is equal to zero.

Departure, To Take a. To determine the exact position of the ship preparatory to starting on a voyage. This point may be determined by cross-bearings or by two bearings of three objects. When the land or lights are not visible, as in a fog, the position may be determined approximately by soundings, or by the sound of fog-horns, etc.

Depressed Pole. The pole below the horizon of the observer.

Depression of the Horizon. See Dip.

Depth of a Sail. The extent of a square-sail from the head-rope to the foot-rope, or the length of the after-leech of a stay-sail or boom-sail.

Depth of the Hold. The perpendicular height from the top of the ceiling in any ship to the top of the main deck, or upper beams at the centre of the ship; in single-decked vessels it is the total depth. In large merchant steamers (with three and more decks), the upper or saloon-decks are not counted in the depth of the ship as a rule.

Derelict (Lat. *derelictus*, abandoned). Anything abandoned at sea. A ship is derelict either by consent or by compulsion, stress of weather, etc., and yet, to save the owner's rights, if any cat, dog, or other domestic animal be found on board alive, the ship is not forfeited. The owner may yet recover, on payment of salvage, within a year and a day,—otherwise the whole may be awarded. See Salvage.

Derrick. A perpendicular spar supported by guys, and having a purchase attached for hoisting heavy weights.

Descending Squall. A fitful gust of wind issuing from clouds which are formed in the lower parts of the atmosphere. It is usually accompanied with heavy showers, and the weather-wise observe that the squall is seldom so violent when it is followed as when it is preceded by rain. See White Squall.

Descent. The landing of troops for the purpose of invasion. The passage down a stream.

Descriptive-list. A document which accompanies men when transferred or discharged. In it are noted the name, previous naval service and rating when last discharged, place of birth, age, trade or occupation, and a complete personal description of each man. When sent from a rendezvous it is signed by the commanding officer, but when sent from a vessel it is signed by both the executive and commanding officers.

Desert. To quit one's vessel, station, or duty without leave, and with the manifest intention not to return.

Deserter. One who deserts. See Desertion.

Desertion. The gist of this offense is the *intention not to return.* Absence without leave, with a probability that the party does not intend to desert, is at first to be regarded as straggling, and at the expiration of ten days, if the absence continue, as desertion. In either case the commanding officer is to decide the point of intention, and to cause the offender to be entered on the log and marked on the books of the pay-officer. In the merchant service an absence of forty-eight hours without leave is made conclusive evidence of desertion.

Detach. To relieve an officer, permanently, from any duty in which he may be engaged. In the army the word *relieve* has the signification just given for *detach*, but in the navy *relieve* is applied generally to a temporary relief from duty. See Relieve.

Detached Squadron. A squadron separated from the body of the fleet and sent on special service.

Detaching Apparatus. See Life-boats.

Detail. The body of officers or men ordered to any particular duty. To order to any special service.

Detonation. See Explosives.

Detroit is a port of entry, finely situated on the Detroit River, opposite Windsor (in Canada), 18 miles above Lake Erie, and 7 miles below Lake St. Clair. Lat. 42° 19′ 50″ N.; lon. 82° 58′

W. The river is here a half-mile wide, deep and clear, and serves admirably for harbor purposes. Pop. 119,700.

Development. In naval architecture, the art of delineating a plan of a ship in detail. In the mold-loft, the laying down of the ship from the plan ready for the mold-makers.

Deviation. The deflection of the compass from the magnetic meridian, due to local attraction. A voluntary departure from the usual course of the voyage without any necessary or justifiable cause,—a step which discharges the insurers from further responsibility. Liberty to touch, stay, or trade in any particular place not in the usual course of the voyage must be expressly stated in the contract, and even this is subordinate to the voyage. The causes of necessity which justify deviation are (1) stress of weather; (2) urgent want of repairs; (3) to join convoy; (4) succoring ships in distress; (5) avoiding capture or detention; (6) sickness; (7) mutiny of the crew. It differs from a *change* of voyage, which must have been resolved upon before the sailing of the ship. See COMPASS, THE MARINER'S.

Devil. A sort of priming made by damping and bruising gunpowder.

Devil-bolts. Bolts with false clinches, often introduced into contract-built ships.

Devil-fish. The *Lophius piscatorius*, a hideous creature, which has also obtained the name of fish-frog, monk-fish, bellows-fish, sea-devil, etc. There is also a powerful *Raia*, which grows to an immense size in the tropics, known as the devil-fish, the terror of the pearl-divers. The *Manta* of Spaniards.

Devil's-claw. A very strong kind of split hook made to grasp a link of a chain-cable, and used as a stopper.

Devil's Smiles. Gleams of sunshine among dark clouds, either in the heavens or in the captain's face.

Devil's Table-cloth. See TABLE-CLOTH.

Devil to Pay and no Pitch Hot. The seam which margins the water-ways was called the "devil," and the workmen found it difficult to calk. The phrase means "a difficulty to be overcome and no means of doing it."

Dew. When the temperature in the evening falls below the dew-point (which see), the vapor which can no longer be held in suspension is deposited on the surface of the earth, and is sometimes to be seen falling in a fine mist. This form of the phenomenon of dew is termed by the French *serein*, but there is another which they call *rosée*. The surface of the earth is constantly parting with its heat by radiation; when the sky is covered with clouds, the radiation sent back from the clouds nearly supplies an equivalent for the heat thus parted with; but if the sky be clear, no equivalent is supplied, and the surface of the earth becomes colder than the atmosphere. If the night be also calm, the small portion of air contiguous to the earth's surface will be cooled below the dew-point, and its moisture deposited on the surface in the form of dew. If this moisture be chilled below 32° F., the dew becomes frozen and is called hoar-frost.

DEW-POINT. The minimum temperature at which any assigned quantity of aqueous vapor can be held in suspension in the atmosphere.

Dholl. A kind of dried split pea supplied in India to ships.

Dhony, or Dhoney. A country trading-craft of India from 50 to 150 tons; mostly flat-bottomed. See DONEY.

Dhow. The Arab dhow is a vessel of about 150 to 250 tons burden by measurement,—grab-built, with 10 or 12 ports; about 85 feet long from stem to stern, 20 feet 9 inches broad, and 11 feet 6 inches deep. Of late years this description of vessel has been well built at Cochin, on the Malabar coast, in the European style. They have a great rise of floor; are calculated for sailing with small cargoes; and are fully prepared, by internal equipment, for defense,—many of them are sheathed on 2½-inch plank bottoms, with 1-inch board, and a preparation of chunam and oil, called *galgal*, put between; causing the vessel to be very dry and durable, and preventing the encroachments of the worm, or *Teredo navalis*. The worm is one of the greatest enemies in India to timber in the water, as the white ant (*termites*) is out of it. On the outside of the sheathing-board there is a coat of whitewash, made from the same materials as that between the sheathing and planks, and renewed every season they put to sea. They have generally one mast and a lateen-sail. The yard is the length of the vessel, and the mast rakes forward, for the purpose of keeping this ponderous weight clear in raising and lowering. The tack of the sail is brought to the stem-head, and sheets aft in the usual way. The halliards lead to the taffrail, having a pendant and treble purchase-block, which becomes the backstay, to support the mast when the sail is set. This, with three pairs of shrouds, completes the rigging, the whole made of coir rope. Several of these vessels were fitted as brigs, after their arrival in Arabia, and armed by the Arabs for cruising in the Red Sea and Arabian Gulf, as piratical vessels. It was of this class of vessel that Tippo Sultan's navy at Onore consisted. The large dhows generally make one voyage in the season, to the southward of Arabia; taking advantage of the northeast monsoon to come down, and the southwest to return with an exchange cargo. The Arabs who man them are a powerful, well-grown people, and very acute and intelligent in trade. They usually navigate their ships to Bengal in perfect safety, and with great skill.

Diacle. An old term for a boat-compass.

Diagonal Brace. A wooden or iron brace placed in a diagonal direction.

Diagonal Framing and Stays. A system of framing in which "struts" and "tie-rods" are arranged at such angles that the greatest stress upon them must be in direction of their length. In inverted-cylinder engines, diagonal stays are much used to connect the cylinders with the lower portions of the frame.

In wooden ship-building, diagonal trussing, consisting of flat wrought-iron bars arranged in a lattice form, is secured to the upper portions of the frames and to the deck-beams of the middle body of the vessel. In many vessels diagonal stays extend, between the stanchions, from the deck-beams to the keelson.

Diagonal Lines. The lines cutting the body plan diagonally from the timbers to the middle line.

Diagonal Ribband. A narrow plank made

to a line formed in the half-breadth plan of a ship on the mold-loft floor; by taking the intersections of the diagonal line with the timbers in the body plan to where it cuts the middle line in the diagonal direction, and applying it to their respective stations or frame-lines in the half-breadth plan, and to mark a spot at each station, to which spots a batten is bent, and a curve is formed, to which a ribband can be made as far as the cant bodies extend, and the square frame adjoining.

Diagonal Trussing. Sir Robert Seppings, in his "Improvement for Ships of War," about the year 1800, recommended that, instead of laying the interior planking on horizontal lines, the work should be laid diagonally; and in one of his plans he recommends a truss-frame of wood, in outline similar to the diagonal iron-strapping of to-day, in wooden ship-building.

Diameter, Apparent. The angle which the diameter of a heavenly body subtends. The *true* is the real diameter, commonly expressed in miles.

Diamond-knot. An ornamental knot worked with the strands of a rope, used on the foot-ropes of jib-booms, man-ropes, etc.

Dibbs. A galley-term for ready money. Also, a small pool of water.

Dice. Thus. See STEER.

Dichotomized. A term applied to the moon when her longitude differs 90° from that of the sun, in which position only half her disk is illuminated.

Dicky Sam. A cant term applied to an inhabitant of Liverpool.

Diego. A very strong and heavy sword.

Die on the Fin. An expression applied to whales, which when dying rise to the surface with one side uppermost.

Dieppe. A seaport town of France, Seine-Inférieure, at the mouth of the Arques, on the English Channel, and 33 miles N. of Rouen. Lat. of light-house, 49° 55′ 7″ N.; lon. 1° 5′ 2″ E. The port, inclosed by two jetties and bordered by quays, was small and inconvenient, but has been much enlarged and improved, so that it is now one of the best on the Channel. It has several spacious wet-docks. Pop. 19,500.

Difference of Latitude. See LATITUDE.

Difference of Longitude. See LONGITUDE.

Differences, Second. The differences in the successive values of a varying quantity (corresponding to equal intervals of time), if the quantity do not vary uniformly, exhibit differences among themselves,—these are called *Second Differences.* Thus, in a series of altitudes observed at equal intervals of time (since the altitude does not vary at the same rate at the begining, middle, and end of the interval), the differences between them, taken in succession, will generally exhibit second differences. So again with the elements tabulated in the Nautical Almanac. If these quantities varied uniformly in the interval between the dates for which their values are given, an intermediate value could be correctly interpolated by a simple proportion. The method of "proportional parts" would give the actual change in the interval between the date of one of the tabulated values and that for which we wish to interpolate. But the rate of varying itself varies during the interval, and hence, when great accuracy is required, the necessity for a correction to the change found by proportional parts, which correction is called the "*Equation of Second Differences.*" The question of finding the second difference is simply the finding the rate at which the rate of varying varies. This may be done by taking the two values from the table on each side the required one, and setting them down in order: then add together the 1st and 4th and the 2d and 3d, observing which sum is the greater: half the difference of the two sums is the second difference. The equation of second differences is found by the help of a table. This correction is of the most importance when the quantity under consideration attains a maximum between two times given in the table. The greatest error that can arise in any case from neglecting it is one-eighth of the whole second difference.

Dight. To set things in order; to dress and prepare for inspection.

Digit. A twelfth part of the diameter of the sun or moon; a term employed to denote the magnitude of an eclipse; as, so many *digits* eclipsed.

Dike. See DYKE.

Dill. An edible dark-brown sea-weed, torn from the rocks at low water.

Dillosk. The dried leaves of an edible sea-weed. See DULSE and PEPPER-DULSE.

Dilly-wreck. A corruption of *derelict* (which see).

Diminishing Plank. A plank which is smaller at one end than at the other.

Diminishing Strake. A strake of plank which is continually narrowing in width as it comes to the ends of the ship.

Diminishing Stuff. Tapering plank or boards.

Dimsel. A piece of stagnant water, larger than a pond and less than a lake.

Dinghey, Dinghy, or Dingy. A small boat of India, propelled by paddles, and fitted with a settee-sail, the mast raking forward. The smallest boat that a man-of-war carries; it is used for the light rough work.

Dingle. A sort of boat used in Ireland; a coracle.

Dinnage. See DUNNAGE.

Dip. To lower. *To dip the colors* is to run them down as a salute. An object is said to *dip* when it disappears below the horizon. A heavenly body is said to *dip* when it passes over the meridian.

DIP OF THE HORIZON. The angle through which the visible horizon is depressed below the sensible horizon in consequence of the elevation of the eye of the observer above the surface of the earth. This dip is a correction which must be applied to all altitudes taken at sea, and is calculated for all elevations likely to be used, and the results are arranged in tables. When the sea-horizon is hidden by land, the altitude has to be taken from the shore-line. The distance of this shore-line is estimated, and the dip is found by referring to a table of which the arguments are, "distance of the land" and "height of the eye." The amount of dip is affected by refraction, which raises the visible horizon; but the amount of consequent correction cannot be very accurately determined on account of the complication of the law of refraction near the horizon.

DIP OF THE NEEDLE. When the needle is

free to move vertically it forms an angle with the horizontal; this angle is called the dip, or inclination of the needle. The dip, like the variation, undergoes a cycle of change, and has also diurnal oscillations.

DIPPING NEEDLE. An instrument for measuring the inclination of the needle to a horizontal plane.

DIP-SECTOR. An ingenious instrument for measuring the true dip of the horizon.

Dipper. A name for the water-ousel (*Cinclus aquaticus*). A bird of the Passerine order, but an expert diver, frequenting running streams in mountainous countries.

Dipping-net. A hand-net used for taking small fish out of the water.

Direct Acting Engine. A term applied to an engine in which the motion of the piston is transmitted to a crank or pump plunger without the intervention of beams or levers, and distinguishing particularly the type in which the connecting-rod with its cross-head is between the cylinder and crank.

Direct Fire. See FIRE.

Direction. The direction of the wind is named after the point of the compass *from* which it blows. The direction of a current or stream is named after the point *towards* which it sets. A swell is named after the point from which the waves proceed, like the wind that produces them.

Dirk. A dagger or short sword worn by midshipmen.

Dirt-gabbard. A large ballast-lighter.

Dirty Aulin. See AULIN.

Disable. To deprive of ability or strength; to render unfit for service by the infliction of wounds or injury, — applied to persons and things.

Disarm. To deprive of weapons; to render harmless.

Disc, or Disk. The face of the sun, moon, or planet as it appears projected on the sky.

Discarcare (*Ital.*). An old term meaning to unload a vessel.

Discourse. An old sea-term meaning to traverse to and fro off the proper course.

Disembark. The opposite of embark; the landing of men from any vessel or boat.

Disembogue. The fall of a river into the sea; the word has also been used for the passage of vessels across the mouth of a river and out of one.

Disguise. Ships in all times have been permitted to assume disguise to impose upon enemies, and obtain from countries in their possession commodities of which they stand in need.

Disinfectants. These substances are of various kinds and act in various ways. Air and water are nature's great purifiers; but when these cannot act advantageously, it is necessary to apply some of the many powerful chemical agents which are available. The most convenient and efficacious are carbolic acid and its preparations, Condy's fluid, chloride of lime, and Burnett's solution. Chlorine is the most effective agent for fumigating a ship; it may be evolved from chloride of lime by moistening it with water or dilute sulphuric acid; it may also be obtained by pouring 4 parts of hydrochloric acid on 1 part of binoxide of manganese placed in a shallow vessel and gently heated.

In many cases the burning of sulphur will be found a simple and efficacious means of disinfecting a room. Infected clothing may be disinfected by plunging in boiling water, or by heating in an oven. Cloths saturated with a solution of chloride of lime may be hung up in an inhabited room to disinfect the air.

Disk. See DISC.

Di-slyng. See SLYNG.

Dismantled. The state of a ship unrigged, and all her stores, guns, etc., taken out, in readiness for her being laid up in ordinary, or going into dock, etc.

Dismasted. State of a ship deprived of her masts by accident or by design.

Dismount. To remove a gun from its carriage.

Dispart. The difference between the semi-diameters of those parts of a gun on which the sights are placed. *To dispart* a gun is to bring the line of sight parallel to the axis of the bore. This is done by erecting at some point on the gun forward of the base-ring a *dispart sight*, which is equal in height to the dispart plus the height of the rear sight. A wooden dispart sight was formerly sometimes lashed on the reinforce. Guns which are cylindrical for a certain distance give at once a line of sight parallel to the axis of the bore. Sights are now so fitted that when the head of the rear sight rests on the sight-box, the line of sight is parallel to the axis of the bore. In using a dispart it is necessary to point a certain distance above the target to make allowance for the fall of the projectile by the action of gravity; this distance, therefore, depending upon the time of flight of the projectile.

Dispatch-boat. A small, swift vessel for carrying dispatches.

Displacement. The weight of the water displaced by the immersed sides and bottom of a vessel.

Disrate. To reduce to a lower rating; to break a petty officer. See RATE.

Distance. The length in nautical miles of the rhumb-line joining any two places on the surface of the earth. On Mercator's chart the rhumb is represented as a straight line.

DISTANCE, SHORTEST. The length in nautical miles of the arc of a great circle passing through any two points on the earth's surface.

DISTANCE BETWEEN TWO HEAVENLY BODIES. This is not the absolute linear distance between the two bodies, but their angular distance measured on the arc of a great circle passing through both bodies. The *observed* distance is the reading of the instrument by which the measurement is made. This being cleared of "index error" and "semi-diameters" is the *apparent* distance. The apparent distance being cleared of "refraction" and "parallax" is reduced to the *true* distance, or the angle which is formed by two straight lines joining the bodies and the centre of the earth.

DISTANCE, LUNAR. The angular distance between the moon and any other heavenly body. See LUNAR DISTANCE.

Distemper. A preparation of opaque or body colors with size instead of oil. White distemper is used instead of whitewash (whiting 40 pounds, glue 6 pounds). Yellow distemper is used for smoke-stacks (whiting 40 pounds, glue 6 pounds, yellow ochre 80 pounds). The glue is made into size and added hot to the whiting and yellow

ochre, and sufficient water is added to give it the proper consistency.

Distiller. A name commonly applied to the condenser of a distilling apparatus.

Distilling Apparatus. An apparatus for extracting a liquid from its non-volatile impurities, such as may be held in solution or suspension, by means of evaporation and condensation. It consists principally of a retort, evaporator, or boiler, in which the pure liquid is vaporized, by heat, leaving behind the non-volatile substances, and a condenser in which the vapor is brought in contact with cold metallic surfaces and condensed to liquid again. The condenser is a vessel containing a "worm," or "nest of tubes," kept cold by the circulation of cold water on one surface while the other is exposed to the vapor. In large distillers the circulation of the refrigerating water is generally accomplished by a pump. The non-volatile substances are drawn from the boiler before the contained solution reaches the point of saturation. By this process sea-water is converted into fresh water, which, however, is not considered potable until it has regained its normal quantity of air held in suspension, much of which escapes if the water leaves the distiller at a high temperature. It is impossible to obtain absolutely pure water by a single distillation, as some impurities are carried mechanically with the vapor, particularly if the boiler "foams." Volatile matter, the vapor of which condenses at about the same temperature as that of water, cannot be eradicated by this process. In many steamships the steam used in the distiller is drawn from the main boilers, but it is desirable that the whole apparatus be independent of the main machinery. Distillers are generally provided with filters.

Distinguishing Pennant. Each vessel in a fleet is represented by a pennant which, hoisted with a signal, denotes the special vessel to which the signal is made. See SIGNALS.

Distress Signals. When a vessel is in imminent danger, she hoists her colors upside-down, fires guns, lets fly topgallant-sheets, and if at night, sends up rockets, burns signals,—in short, does anything to attract attention.

Ditty-bag. The name is derived from the *dittis*, or Manchester stuff of which it was formerly made. See BAG.

Ditty-box. A small box to hold a sailor's thread, needles, brushes, combs, etc. As ditty-boxes lumber up the decks, they are not generally allowed on board a man-of-war.

Diurnal Arc. That part of a circle described by a heavenly body from its rising to its setting.

Dive. To plunge head foremost into the water.

Diver. One versed in the art of descending under water to considerable depths and abiding there a competent time for several purposes, as to recover wrecks of ships, fish for pearls, sponges, corals, etc.

Divergent. A stream flowing laterally out of a river, contradistinguished from convergent.

Divie-goo. A northern term for the *Larus marinus*, or black-backed gull.

Divine Service. See ARTICLES FOR THE GOVERNMENT OF THE UNITED STATES NAVY (2, 3).

Diving. The subject of diving has not received the attention which it merits in our service. The necessary apparatus has at times found a place in the store-room equipment of our ships, but its practical use has been very infrequent. Want of trained divers has been our drawback. A good diver can command too good wages in civil life to allow of his enlisting in the navy, where if he were not a seaman he could only receive the rating of landsman. Diving is becoming every day of greater importance. In peace times hardly a month goes by in a cruising-ship that her safety, efficiency, or construction expenditure account might not be benefited by the presence on board of a few good divers. A valve becomes unseated, a leak is sprung and its location cannot be traced from inboard, a propeller is fouled, a cable is unshackled and an anchor lost, a steam-launch is dropped from the davits and sunk, a rifle or pistol is dropped overboard, sheets of copper become displaced or worn, the bottom becomes foul,—in all these cases a service diver might have been of great use and have prevented either loss, the borrowing of divers from foreign men-of-war or from the shore, or the docking of the ship. In war times divers become almost indispensable; besides the duties already suggested, they become invaluable for torpedo work.

Ours is the only service known to the writer where attention has not been paid to this valuable branch of the *personnel*.

In the British navy seamen-divers are trained on board the gunnery-ships "Excellent" and "Cambridge;" when qualified they receive 2 cents a day additional pay,—for the time that they are actually employed under water they receive 48 cents an hour,—this is, of course, in addition to the pay they may receive for the ship's rating they hold. Besides the seaman-divers there is a class of mechanical divers taken from the engineer's and carpenter's crews. These receive 2 cents a day like the seamen, and when employed under water 62½ cents. The number of divers varies with the complement, ranging from 2 to 6 seamen-, and about the same number of mechanical divers. The "Triumph," flag-ship of the Pacific Squadron, had 6 seamen- and 4 mechanical divers. All ships commanded by post-captains carry one diving apparatus, flag-ships two. Vessels fitted for special service as many as may be thought necessary. Each apparatus will supply air to two men under water at a depth not exceeding 10 fathoms. The men who are placed under instruction are selected from among volunteers, great attention being given to their physical condition, as perfect health is required for diving. Officers are instructed at their own request, and are allowed additional compensation for the accomplishment. It can readily be understood that it would be of the utmost importance in some cases to be able to use the eyes and intelligence of an officer.

In the French service divers are instructed aboard the receiving-ships in each of the naval ports. The men for instruction are drawn from the engineer's, carpenter's, and seamen divisions, being first subjected to a rigorous physical examination. After the regular course of instruction they are forced to keep themselves in constant practice, and are examined at stated intervals. Prizes are offered for different feats of diving at the yearly prize contests, which take place aboard every vessel in commission. There

is no continuous additional pay, but each time that a man is employed under water he receives 60 cents plus 1 cent for every minute employed. Every screw-vessel carries a complete apparatus, and additional ones are allowed when it is thought proper. The "Victorieuse," flag-ship of the Pacific Station, had 14 divers. It may be interesting to note that her bottom was thoroughly cleaned by four of her own men in three days at a cost to the government of $72.75, whereas at the same time it was found that to clean the "Pensacola's" bottom would have cost our government nearly $1000, she having no divers.

In the Italian service there is a regular corps of torpedo men, whose education as machinists and seamen combined fits them for submarine work. These men are all divers, being instructed at the Royal Torpedo School. They receive from 40 to 80 cents for each hour of work, according to their rating and proficiency. The frigate "Garibaldi," of the Pacific Station, had 14 divers.

In the German service there are diving-schools at Kiel and Wilhelmhaven, where a large number of machinists and artificers are instructed. The instruction is very thorough. These men receive about 60 cents for each hour of submarine work. No continuous remuneration. The iron-clad corvette "Hansa," Pacific Station, had on board 12 trained divers.

The Chilian service is supplied with divers from the English service, and during the present war has found them of the greatest use.

The Peruvian service had no divers until the loss of the "Huascar" caused them to see the great necessity of clean bottoms; they have now supplied the deficiency with foreigners.

The Denayrouze apparatus is used in all the services cited. It consists of an air-pump, a receiver and reducer, a diving costume, and the necessary hose, signal-tubes, ropes, weights, ladders, and tools. A submarine lamp is also provided. A new form of the apparatus adopted in the Italian service allows the diver to disconnect himself from the pump, carrying a supply of condensed air in a magazine on his back. This is a valuable accessory for torpedo work.—*Theo. B. M. Mason, Lieutenant U.S.N.*

Diving-bell. A hollow vessel, sometimes bell-shaped, in which a person may descend and remain for a time below the surface of the water; it is said to have been used by the Phœnicians 320 B.C.

Division. A secondary group of ships in a fleet. (See Fleet Tactics.) A sub-classification of the ship's company; as, the powder division, master's division, the gun divisions, etc.

Doa. A Persian trading-vessel.

Doasta. An inferior spirit, often drugged or doctored for unwary sailors in the pestiferous dens of filthy Calcutta and other seaports in India.

Dob. The animal inhabiting the razor-shell (*Solen*), used as a bait by fishermen.

Dobber. The float of a fishing-line.

Dobule. A fresh-water fish, allied to the roach.

Dock. An artificial basin or inclosure for the reception of shipping, either for the purpose of loading, unloading, building, or repairing.

Docks may be divided into two general classes —*wet* and *dry*. Wet-docks are constructed for the purpose of facilitating the lading and unlading of vessels, and for the better preservation and storage of merchandise. They also afford a place of safety in which vessels can lie without exposure to the dangers of an open roadstead, the rapid current of rivers, or extreme changes of tide. In ports which occupy central commercial positions, but which enjoy but few natural advantages, such improvements in the accommodation of shipping give them greater importance and encourage maritime enterprise.

Vessels are admitted into wet-docks through a gate at high tide, which, being closed, the water within is retained at a constant depth, not being affected by the changes of tide without.

The most extensive systems of wet-docks in the world are found in England. At Liverpool 37 wet-docks have been constructed; the whole dock water-space covering an area of 239 acres, while the quay-space is 16 miles in extent. At Birkenhead, on the southwest side of the Mersey, directly opposite to Liverpool, docks have been constructed with a water area of 165 acres, and an extent of nearly 11 miles of quay. These docks are connected one with another, and most of them have connections with the Mersey.

The docks of the Thames are built upon both sides of the river, and cover an area of 235 acres. Hydraulic power is used in the docks of London and Liverpool, by which the cranes, capstans, and gates are moved, and warehouses of magnificent construction and dimensions are built upon the quays. Stringent rules are enforced regarding the use of fire on board the vessels as a precaution against conflagrations. Wet-docks of less extent are found in all of the important sea-ports of Great Britain, in the French ports of Havre, Brest, Toulon, and Cherbourg, and in many ports of the Baltic Sea.

The Atlantic dock, at Brooklyn, L. I., is another example of a wet-dock. The whole area occupied is about 80 acres, 42 of which is water-surface. The basin is inclosed by piers 150 feet wide, and that pier which divides it from the East River has an entrance 200 feet in width. Warehouses are built upon the piers, and in some portions the depth of water is 25 feet at low tide.

Dry-docks include all structures which are used for the examination, repairing, or building of vessels, as graving-docks, floating-docks, hydraulic-docks, etc. The graving-dock at the navy-yard, in Brooklyn, is one of the largest in the United States. It is of granite, and was completed in 1851, having been ten years in building. The main chamber is 286 feet long and 30 feet wide at the bottom, and 307 feet long and 98 feet wide at the top. The width of the entrance is 68 feet, and depth of water at high tide 26 feet. The entrance is closed by a floating-gate or caisson 66 feet long, 16 feet beam, and 30 feet in depth, which is held in position by the keel at each end entering a vertical groove in the masonry at each side of the entrance. It is lowered or raised by admitting the water or pumping it out.

Turning-gates are also used in addition to the caisson, when circumstances require, but if they are left open, an additional length of 52 feet can be obtained for dock room. The engines for emptying this dock are of sufficient power to

pump 610,000 gallons of water in two hours and ten minutes.

The graving-docks at the Boston and Norfolk navy-yards are similar to that above described, but are of less dimensions, the floors of the main chambers being 228 feet long and 30 feet wide. By using the space between the caisson and turning-gates, a total length of 306 feet can be obtained.

Two graving-docks have been built at South Brooklyn, L. I. No. 1 is 500 feet long, with a width at the bottom of 60 feet, and can admit vessels at high water drawing 18 feet. No. 2 is 447 feet long, and admits vessels at high water drawing 22 feet, and at low water, 17 feet. The latter dock may be divided in two parts by means of a central gate, serving the purpose of two separate docks. These docks are emptied by a horizontal engine of 100 horse-power, connected with a double centrifugal pump capable of ejecting 40,000 gallons of water per minute, and by two oscillators, which are used for drainage, having an average capacity of 1000 gallons per minute.

Floating balance dry-docks have been built at the Portsmouth and Pensacola navy-yards, and there is a floating sectional dry-dock at the navy-yard at Mare Island, Cal. The latter consists of 10 sections, each 100 feet long, 32 feet broad, and 11 feet 9 inches high, with two end-floats to each section, each 26 feet 8 inches long, 15 feet wide, and 8 feet high. There is also a stone basin and two marine railways extending from one side. The sections can be used as two separate docks, 6 sections being sufficient to lift a ship of the largest class in the navy, while a smaller one can be docked upon the four remaining sections. A ship of the largest class can also be received upon each of the railways, thus making the dock capable of receiving four vessels at once. The displacement of this dock is 11,040 tons, and its lifting capacity about 5000 tons.

Balance-docks are so called on account of the means which are provided for retaining them at an exact level by pumping water out or letting it into the compartments of the side chambers. The balance-docks at the Portsmouth and Pensacola navy-yards are a combination of the caisson and camel, and are alike, except that the latter is provided with extra fixtures for steadying vessels when it is used as a camel for carrying vessels across the bar. They are 350 feet long, 105 feet 4 inches wide, and 38 feet deep. The interior width is reduced to 90 feet by the chambers on each side, which have a width of 7 feet 8 inches. These docks are capable of lifting ships of the largest size. Preparatory to receiving a ship the dock is sunk by pumping water into it until it is full to the deck, and then into the chambers, the water operating as ballast and sinking the dock to the required depth. To sink it sufficiently to receive a ship of 2000 tons displacement, it is necessary to pump 240 tons of water into each side chamber. When the ship is in position for lifting, the water ballast is drawn off by opening valves in the lower side chambers, causing the dock to rise until it touches the bottom of the ship. The water is then pumped out of the side chambers and bottom tank, and the dock rises with its load. The time required for docking a ship of 2000 tons displacement is about two hours.

A new iron sectional dock is in process of construction by John Roach & Sons, of Chester, Pa., to replace the balance-dock at Pensacola.

Sectional, balance, and docks of other descriptions have been constructed in all of the important seaports of the United States. The Sectional Dock Co. of New York owns 18 sections, any number of which may be used for a single ship as required.

The largest floating-dock in the world is at Bermuda, where it was towed from England in June, 1864. It has an extreme length of 381 feet, and an inside length of 333 feet. Width over all, 123 feet 9 inches, and inside width, 83 feet 9 inches. Its depth is 74 feet 9 inches, and weight 8350 tons. It is capable of lifting the largest class of armored vessels. It is a balance-dock, having the space between the two skins divided into 48 water-tight compartments, by means of which, with the side chambers, the structure is sunk or raised, and retained in a level position.

The "Simpson docks," which have been constructed at Portland, East Boston, New York, Baltimore, and Chester, are similar to the graving-dock, but are built of wood instead of stone. By the use of this material these docks can be enlarged as the future needs of shipping may require at a comparatively small expense, while the first cost of construction is much less.

The most modern system of dry-docks is that which has been constructed at Nicolaieff, Russia, by Messrs. Clark, Stanfield & Co., upon the recommendation of Admirals Lesovsky and Popoff, of the Russian navy.

The lifting portion of this dock consists of 14 pontoons attached to a lateral side. To this side a floating outrigger is attached to give it greater stability. The side is composed of three parts, any two of which, with its corresponding number of pontoons, is capable of lifting a vessel of the smaller class, or the remaining third section if it should require repairs. For vessels of great length all of these sections can be used; but for vessels of extreme breadth of beam, as the circular ironclads of the Russian navy, the pontoons at the extremities of the dock can be detached and joined to the ends of the pontoons which remain fixed to the structure, thus forming an area corresponding in shape to that of the vessel. A number of transverse apertures are made in the dock, to allow of the entrance of corresponding rows of piling in the landing-stage or dock upon which the vessel is to be deposited. The vessel having been lifted and placed in position over the landing-stage, the floating-dock is sunk and removed, and can then be used for docking other vessels.

The great advantages of this system are that it is capable of being extended for lifting vessels of any size or model, and that the accommodations for docking vessels are only limited by the extent of the pilings upon which the vessels are placed.—*E. T. Strong, Lieutenant U.S.N.*

Dock-dues. The charges made upon shipping for the use of docks.

Dock Herself. When a ship is on the ooze and swaddles a bed, she is said to dock herself.

Docking a Ship. The act of drawing her into dock and placing her properly on blocks, in order to give her the required repair, cleanse the bottom, and cover it anew. See Breaming.

Dock-yards. Arsenals containing all sorts of naval stores and timber for ship-building. In England the royal dock-yards are at Deptford, Woolwich, Chatham, Sheerness, Portsmouth, Devonport, Pembroke. Those in her colonies are at the Cape of Good Hope, Gibraltar, Malta, Bermuda, Halifax, Jamaica, Antigua, Trincomalee, and Hong-Kong. There her majesty's ships and vessels of war are generally moored during peace, and such as want repairing are taken into the docks, examined, and refitted for service. These yards are generally supplied from the north with hemp, pitch, tar, rosin, canvas, oak-plank, and several other species of stores. The largest masts are usually imported from New England. Until 1831 these yards were governed by a commissioner resident at the port, who superintended all the musters of the officers, artificers, and laborers employed in the dock-yard and ordinary; he also controlled their payment, examined their accounts, contracted and drew bills on the Navy Office to supply the deficiency of stores, and, finally, regulated whatever belonged to the dock-yard. In 1831 the commissioners of the navy were abolished, and admirals and captains superintendent command the dock-yards under the Controller of the Navy and the Admiralty. See Establishments, Naval.

Dock Up, or Duck Up. To clew up a corner of a sail that hinders the helmsman from seeing.

Doctor. A medical officer. See Surgeon.

Doctor's List. See Sick-list.

Dodman. A shell-fish with a hod-like lump. A sea-snail, otherwise called *hodmandod.*

Do For. A double-barreled expression, meaning alike to take care of or provide for an individual, or to ruin or kill him.

Dog. The hammer of a firelock or pistol; that which holds the flint, called also dog-head. A sort of iron hook or bar with a sharp fang at one end, so as to be easily driven into a piece of timber, and drag it along by means of a rope fastened to it, upon which a number of men can pull. *Dog* is also an iron implement with a fang at each end, to be driven into two pieces of timber to support and steady one of them while being dubbed, hewn, or sawn. *Span-dogs.* A pair of dogs linked together, and being hooked at an extended angle, press home with a great strain. *To dog* a rope is to fasten it to a spar or cable in a peculiar manner, causing the parts to bind on each other and thus prevent slipping.

Dog-bitch-thimble. An excellent contrivance by which the topsail-sheet block is prevented making the half cant or turn so frequently seen in the clew when the block is secured there.

Dog-bolt. A round piece of iron driven into a hole which has been bored for the purpose, and the wedges are driven against this bolt; they are used in planking wooden ships.

Dog-drave. A kind of sea-fish mentioned in early charters.

Dog-fish. A name commonly applied to several small species of the shark family.

Dogg. A small silver coin of the West Indies, six of which make a bit.

Dogger. A Dutch smack of about 150 tons, navigated in the German Ocean. It is mostly equipped with a main- and a mizzen-mast, and somewhat resembles a ketch or a galliot. It is principally used for fishing on the Dogger Bank.

Dogger-fish. Fish bought out of the Dutch doggers.

Dogger-men. The sea-faring fishermen belonging to doggers.

Dogs. The last supports knocked away at the launching of a ship.

Dog's-body. Dried pease boiled in a cloth.

Dog's-ear. A small bight made in the leech-rope of a sail in reefing, making up, etc. See Awning.

Dog-shore. A piece of timber which used to be placed at the forward end of the launching-ways; it was intended to hold the ship until all was ready for launching. It was placed in a diagonal position, with one end to the ground or immovable ways. Both ends were rounded so that it could be readily knocked out when the word was given.

Dog-sleep. The uncomfortable fitful naps taken when all hands are kept up by stress.

Dog's Tail. A name for the constellation Ursa Minor, or Little Bear.

Dog-star. The popular name of *a Canis Majoris.* See Sirius.

Dog-stopper. A stopper put on before all to enable the men to bitt the cable, or to fleet the messenger.

Dog-tongue. A name assigned to a kind of sole.

Dog-vane. A small vane made of thread, cork, and feathers, or bunting, fastened on the end of a half-pike, and placed to windward, so as to be readily seen, and show the direction of the wind. The term is also familiarly applied to a cockade.

Dog-watch. The half-watches of two hours each, from 4 to 6, and from 6 to 8, in the evening. By this arrangement an uneven number of watches is made,—seven instead of six in the twenty-four hours; otherwise there would be a succession of the same watches at the same hours throughout the cruise. See Watch.

Dog-whelk. The name given by fishermen to the *Nassa reticulata,* a common species of univalve shells.

Doit. A small Dutch coin, valued at about half a farthing.

Doldrums. Those parts of the sea where calms are known to prevail. They exist between and on the polar sides of the trade-winds, but vary their position in the course of the year, depending upon the sun's declination. Also applied to a person in low spirits.

Dole. A stated allowance; but applied to a scanty share or portion.

Doling. A fishing-boat with two masts, on the coasts of Sussex and Kent; each of the masts carries a sprit-sail.

Do-little, or Do-little Sword. The old term for a dirk.

Dollop. An old word for a lump, portion, or share. From the Gaelic *diolab.*

Dolphin. Naturalists understand by this word numerous species of small cetaceous animals of the genus *Delphinus,* found in nearly all seas. They greatly resemble porpoises, and are often called by this name by sailors; but they are distinguished by having a longer and more slender snout. The word is also generally, but less correctly, applied to a fish, the dorado (*Coryphœna hippuris*), celebrated for the changing hues of its body when dying. A small light ancient

boat, which gave rise to Pliny's story of the boy going daily to school across the Lucrine Lake on a dolphin. In old ordnance, especially brass guns, two handles nearly over the trunnions for lifting the guns by. A French gold coin (*dauphine*), formerly in circulation. A stout post on a wharf or beach to which hawsers are made fast. A kind of wreath or strap of plaited cordage. A permanent fender around a heavy boat just below the gunwale. The name is also given to a spar or block of wood, with a ring-bolt at each end, through which a hawser can be rove, for vessels to ride by; the same as wooden buoys.

DOLPHIN-STRIKER. A short perpendicular spar under the bowsprit, giving spread to the upper head-stays.

Domestic Navigation. The coasting and inland trade.

Domicile. A residence at a particular place, accompanied by positive or presumed proof of an intention to remain there for an unlimited time. The residence to create it may be short or long, according to circumstances; the determining consideration is the intention of remaining, or the contrary. The original domicile of a person always continues until he has fairly changed it for another, and to effect such change there must be a union of intention and act. Domicile may arise either from birth, from the domestic relations, or from election. The domicile of birth remains until a subsequent one is acquired. A woman on marriage takes the domicile of her husband. The husband's change of domicile changes that of his wife, and the parent also possesses the power of changing the domicile of his minor child by changing his own. The necessarily migratory lives of naval and military men makes the subject of domicile of peculiar interest to them. The disposition, distribution, and succession of personal property are governed by the law of the owner's or intestate's domicile at the time of his death, and not by the conflicting laws of the various places where the goods happen to be situated. See INTERNATIONAL LAW.

Don. A general name for Spaniards. *To don*, to put on.

Donaldson, Edward, Rear-Admiral U.S.N. Born in Maryland. Appointed midshipman, October, 1834, and went to West Indies in "St. Louis," and returned following year in the "Falmouth"; went out in the fall of 1835 to the West Indies, in the "Warren"; transferred to the "Vandalia," and continued until 1838; in frigate "Columbia," East Indies, 1839–40; while attached to her, took part in the attacks on forts on the coast of Sumatra, 1839.

Promoted to passed midshipman, June 22, 1841; in McLaughlin's Mosquito Fleet, in Florida, 1841–42; in brig "Truxtun," 1843–44; sloop "Erie," coast of Africa, 1845; on the coast survey in 1846; cruise in sloop "Plymouth," East Indies, 1847–48.

Commissioned as lieutenant, October 23, 1847; in brig "Dolphin," East Indies, 1849–50; at rendezvous, Baltimore, 1852; in steamer "Water-Witch," river La Plata, 1853–54; steam-frigate "Merrimac," special service, 1856–57; receiving-ship at Baltimore, 1858–59; in steamer "San Jacinto," coast of Africa, 1860–61; rendezvous, Philadelphia, 1861; commanding steam-gunboat "Scioto," West Gulf Squadron, 1861–62; bombardment, etc., of Forts Jackson and St. Philip, and capture of New Orleans, April, 1862, and other operations in the river.

Commissioned as commander, July 16, 1862; commanding receiving-ship at Philadelphia in 1862–63; steamer "Keystone State" in trip to the West Indies in search of the "Sumter"; commanding steamer "Keystone State," North Atlantic Squadron, 1863–64; commanded the steam-sloop "Seminole" at the battle of Mobile Bay, August 5, 1864; ordnance duty, Baltimore, 1865.

Commissioned as captain, July 25, 1866; commanding receiving-ship at Baltimore, 1866–68; at New York Navy-Yard, March, 1869, to February, 1870.

Commissioned as commodore, 1871.

Commissioned as rear-admiral, 1876, and retired the following year.

Donderbass. A Dutch name for *bombard.*

Doney. The doney of the Coromandel coast is about 70 feet long, 20 feet broad, and 12 feet deep; with a flat bottom or keel part, which at the broadest place is 7 feet, and diminishes to 10 inches in the siding of the stem and stern-post. The fore and after bodies are similar in form from midships. Their light draft of water is about 4 feet, and when loaded about 9 feet. These unshapely vessels trade from Madras and Ceylon, and many of them to the Gulf of Manar, as the water is shoal between Ceylon and the southern part of the continent. They have only one mast, and are navigated by the natives in the rudest way, their means for finding the latitude being a little square board, with a string fast to the centre, at the other end of which are certain knots. The upper edge of the board is held by one hand so as to touch the north star, and the lower edge the horizon. Then the string is brought with the other hand to touch the tip of the nose, and the knot which comes in contact with the tip of the nose tells the latitude.

Donkey-engine. A small auxiliary steam-engine for performing other work than that of propulsion, such as supplying power to blowers, lathes, steam-winches, capstans, etc. It is generally provided with an independent boiler suitable to its size; but, on shipboard, its steam is sometimes drawn from the main boilers.

Donkey-pump. An auxiliary pump independent of the main engines, used for feeding boilers, extinguishing fire, for which purpose nozzles for connecting fire-hose are attached, circulating water through a distilling apparatus, and pumping water from the bilge of a ship.

Donny. A small fishing-net.

Doolah. A passage-boat on the Canton River.

Dooted. Timber rendered unsound by fissures.

Dorado. The *Coryphœna hippuris*, an oceanic fish, often called "dolphin." See CONSTELLATION.

Dorey. A flat-floored cargo-boat in the West Indies named after the fish "John Dory."

Doria, Andrea, was born in Oneglia, of which his family were princes, in 1468. Descended from one of the noblest Genoese houses, which had been celebrated for many generations, the great admiral numbered among his ancestors the Admiral Lamba Doria, who gained the bloody victory of Curzola, over the Venetians, under

Dandolo, in 1298; Philippi Doria, a distinguished naval commander, whose name was, however, stained by political crimes; and Paganino Doria, a great admiral (1351), who repeatedly defeated the Venetians, under Pisani. Lastly came Peter Doria, who was killed in action with the Venetian fleet.

Andrea Doria, the greatest seaman the state of Genoa ever produced, was forced, when a young man, by the banishment of his family from Genoese territory, to enter the service of the Pope, from which he passed into that of several other Italian princes. Having gained military and political experience, he became a knight of St. John of Jerusalem, and made a pilgrimage there, upon his return espousing the cause of Charles VIII. against the Spaniards.

The latter were commanded by Gonsalvo de Cordova, who so much admired Doria's prowess that he tried, in vain, to draw him over to the Spanish side.

At last Doria was enabled (by the withdrawal of the decree of banishment) to enter the service of his own country. After subduing a formidable rebellion in Corsica, he was given command of the Genoese navy, which he thoroughly reorganized. After this he was active in repressing the Barbary corsairs,—the terror of all nations at that time. Once more banished from Genoa, he again entered the service of France,—Francis I. making him "general of the galleys of France." In this capacity he fought the Imperial fleet, raising the blockade of Marseilles, and having other successes. After the battle of Pavia he pursued the Spanish fleet which carried Francis a prisoner; but the latter sent him word to desist from attack, as he had given his parole not to escape.

Doria next, in the name of Francis, seized Genoa,—which was torn by factions,—and established peace there. Francis wishing to make of Savona a rival port to Genoa, Doria protested against it, and the king ordered his arrest; but, strong in the fleet, Doria easily escaped, and sent his commission to the French king. Irritated by this injustice, he then passed over to the service of the Emperor Charles V., and was the means of destroying the vestige of French power in Italy, delivering Genoa in 1528.

A general peace soon followed, and Doria busied himself in composing the troubles in his native land, refusing the title of doge, and abolishing the life-tenure of that office. He might then have had absolute power in Genoa had he chosen. Unfortunately, the oligarchy was strengthened by his actions, and, under the name of a republic, existed until Napoleon's time.

Charles V. loaded Doria with honors and riches; gave him the order of the Golden Fleece; made him Prince of the Empire, and General of the Marine, with absolute authority. He continued to serve against the Turks, the Algerines, and the French, occupying the very foremost place in all the great events of the time.

As a seaman he was, without doubt, the first of his period; and, although he had been a free lance, and had served many masters, he has never been charged with betraying any one of them.

Genoa owed her existence as a state to him, and recognized the obligation by voting him "The Father and Liberator of his Country." In his latter days, however, fresh troubles and dissensions arose, and Doria became the object of great hatred and dangerous conspiracies by some of the oligarchy, so that the latter part of his life was stained by lamentable cruelty and bloodshed. He died in 1560, at the great age of 92.—*E. Shippen.*

Dornicle. A name for the viviparous blenny.

Dorra. From the Gaelic *dorga;* a crab-net.

Dorsal Fin. The median fin placed upon the back of fishes.

Dory. A fish, *Zeus faber*, commonly known as "John Dory," or truly *jaune dorée*, from its golden hues.

Double. Two of a sort taken together; having two similar parts. To increase by the addition of the same quantity. To cover a portion of the ship with an extra planking,—applied only when the extra planking is not less than two inches thick. *To double* a cape, to sail round it. *To double on the tub*, to get twice one's share by sharp practice. *To double upon*, in a naval engagement is to inclose a portion of the enemy's fleet between two fires.

DOUBLE-ACTION. See ACTION.

DOUBLE ALTITUDE. See ALTITUDE.

DOUBLE-BANK. *To double-bank* a rope is to clap men on both sides of it. See BANK.

DOUBLE-BITT. To take two turns of the cable around the bitts.

DOUBLE-BLOCK. A block having two sheaves.

DOUBLE-CAPSTAN. A capstan so constructed as to be worked from both decks.

DOUBLE-CROWN. See CROWN.

DOUBLE-DECKER. A man-of-war having two gun-decks.

DOUBLE DUTCH COILED AGAINST THE SUN. Gibberish; unintelligible language.

DOUBLE-EAGLE. A gold coin of 20 dollars.

DOUBLE-FUTTOCKS. Two futtocks in one.

DOUBLE-HEADED MAUL. A maul with two faces.

DOUBLE-HEADED SHOT. Two whole balls connected by a bar. See BAR-SHOT.

DOUBLE-IRONS. Fetters for both hands and legs. See IRONS.

DOUBLE-JACK. See JACK-SCREW.

DOUBLE-LAND. The appearance of the coast when the sea-line is bounded by parallel ranges of hills rising inland, one above the other.

DOUBLE-SIDED. A double-decked ship painted so as to show both rows of ports; or, a merchant vessel painted to resemble a double-decker.

DOUBLE SPANISH BURTON. See SPANISH BURTON.

DOUBLE-STAR. Two stars so close together that the angle between them is inappreciable except by means of a telescope.

DOUBLE-STRAP. See STRAP.

DOUBLE-TIDES. *Working double-tides*, doing extra duty.

DOUBLE WALL-KNOT. See WALL-KNOT.

DOUBLING. Planking ships' bottoms twice with two thicknesses of plank. That portion of two masts included between the trestle-trees and cap is termed the *doublings* of the masts.

Doubloon. A Spanish gold coin. See MONEY.

Dough-boy. A hard dumpling boiled in salt water,—a corruption of *dough-ball.*

Douse. To plunge into the water; to dip.

To lower; as, to douse sail. To cover up or extinguish; as, to douse a light.

DOUSER. An extinguisher.

Dousing-chock. A piece fayed across the apron, and lapped in the knight-heads, or inside planking, above the upper deck.

Dout. To put out a light.

DOUTER. An extinguisher.

Dover. A town of England, county of Kent, one of the Cinque Ports, on the N.W. side of Dover Strait, 66 miles E.S.E. from London. Lat. 51° 7′ 8″ N.; lon. 1° 19′ 5″ E. The harbor consists of three basins, the outer one inclosed between two piers 150 feet apart. Dover has been made a harbor of refuge by throwing out jetties of great magnitude, and a granite pier one-third of a mile long, and still unfinished, into the sea. Dover being one of the chief ports of communication between England and the continent, has continual intercourse by steamboats with Calais and Boulogne. Ship-building, sail- and rope-making employ many of the population. Dover is the principal of the Cinque Ports. Pop. 29,000.

Dovetail. A score in the end of a piece of wood resembling a dove's tail, and into which a corresponding piece is fitted, for the purpose of securing two pieces, which are placed at right angles with each other.

Dowbrek. A name for the spirling, or smelt.

Dowel. A method of coaking by the use of a round piece of hard wood, instead of an oblong piece, one-half the length of the dowel being let into each piece; when two pieces of timber, as in the frame of a ship, are to be secured together, the fastenings are sometimes driven through the dowels.

Down! To come, take, put, or haul down. *To bring the sun down* is to bring in contact the horizon and the image of the sun reflected in a sextant.

DOWN BAGS! The order from the boatswain's mate for the men to stow away their bags in the proper place.

DOWN BOOMS! The order to lower the stun'-sail booms when the sails are furled.

DOWN FROM ALOFT! The order for the men to come down after furling, reefing, etc. No manœuvre is completed until the last man is on deck.

DOWN-HAUL. A rope to haul down, or assist in hauling down, a sail. A stay-sail down-haul is secured to the head cringle of the sail, and leads thence through the hanks, and a leading-block at the tack, to the deck. A try-sail down-haul is made fast to the upper after-corner of the sail, and leads thence through a block at the jaws of the gaff to the deck. A gaff-topsail down-haul (and clewline) is made fast to the clew, and leads thence through a block at the head to the deck. A topgallant studding-sail down-haul is bent to the yard-arm, and leads abaft into the top. A topmast studding-sail down-haul is bent to the outer yard-arm, and reeves thence through a thimble in the leech and a block at the tack, forward of all, to the deck.

DOWN HELM! Put the helm a-lee!

DOWN IN THE MOUTH. Low-spirited; disheartened.

DOWN KILLICK! Let go the killick or anchor!

DOWN WIND, DOWN SEA. A proverbial expression among seamen in the tropics, where the wind soon gets up a sea, which soon goes down when the wind abates.

Downs. An accumulation of drifted sand, which the sea gathers along its shores. The name is also applied to the anchorage or sea-space between the eastern coast of Kent and the Goodwin Sands, the well-known roadstead for ships, stretching from the South to the North Foreland, where both outward- and homeward-bound ships frequently make some stay, and squadrons of men-of-war rendezvous in time of war. It is defended by the castles of Sandwich, Deal, and Dover.

D. R. Dead-reckoning.

Drabler. A piece of canvas laced on the bonnet of a sail to give it more drop. "As the bonnet is to the course, so in all respects is the drabler to the bonnet." It is only used when both course and bonnet are not deep enough to clothe the mast.

Draco (*Lat.* "The Dragon"). A winding constellation, which, commencing from between Ursa Major and Ursa Minor, extends to Lyra. The two principal stars, γ and β, form a conspicuous pair, situated nearly on the line joining *α Lyræ* and *α Ursæ Majoris;* the line which joins *α Cygni* and *β Boötis* also passing near them. *γ Draconis*, also called *Rastaban*, is the nearest one to Lyra; it is of historical interest as being the star used by Bradley in the discovery of aberration.

Dracunculus. A species of fish about 10 inches long, of a reddish-brown color above, and white beneath; sordid dragonet; sculpin; *Callionymus dracunculus.*

Draft. See DRAUGHT.

Drag. Anything towing in the water to retard a ship's progress, or to keep her head up to the wind. A drag-rope. A sea-anchor. A creeper.

To drag for an anchor or chain is to endeavor to pick it up by means of a grapnel or bight of a rope. A ship *drags* her anchor when the wind, tide, or current causes her to go astern, trailing the anchor over the bottom.

DRAG-NET. A trawl or net to draw on the bottom for flat-fish.

DRAG-ROPE. The rope by which are hauled about Gatlings, howitzers, etc., on field-carriages.

Dragoman. The name for a Turkish interpreter; it is corrupted from *tarij-man.*

Dragon. An old name for a musketoon.

Dragonet. A sea-fish, the gowdie, or *Callionymus lyra.*

Dragon-volant. An old name for a gun of large calibre.

Drag-saw. A cross-cut saw.

Drake, Sir Francis. Born in 1539, on the banks of the Javy, in Devonshire, England. A sea-rover in the service of Queen Elizabeth of England. Plunder and prize-money had greater charms for Drake than honor and glory. The earliest mention made of him refers to a voyage in 1572, when, reaching the Caribbean Sea, he landed on the Isthmus of Darien, and beholding the Pacific from a lofty eminence, he prayed that the Almighty would grant him life and leave to sail once an English ship on that sea. His prayer was heard. Four years later he sailed from England with five ships, and passing along the coast of South America, he plundered all who were incapable of resistance, and going around Cape

Horn he steered northerly, visited and sacked Chili and Peru, and took possession of San Francisco. From that point Drake crossed to Java and the Moluccas, enriching himself at every step; and this marauding course he continued until 1580, when he returned home *via* the Cape of Good Hope. In the following year, however, his services were required for a nobler purpose than mere pillage. The Spanish Armada threatened England. To anticipate its attack, Drake, who had now been knighted by Queen Elizabeth for his voyage round the world,—the first of the kind ever made by an Englishman,—sailed to Cadiz, passed the batteries under a heavy fire, destroyed 100 ships, and inflicted the usual damage on the adjoining coasts. Making his way back, he was appointed to aid Lord Howard in repelling the Armada, and when that exploit had been performed he proceeded to the West Indies, where he died, December 27, 1595.

Drake. An early piece of brass ordnance.

Drakkar. A Norman pirate boat of former times.

Draught. A small allowance for waste on goods sold by weight. A detachment transferred from one ship to another. A drawing, made to scale, of a structure or machine.

The current of air through a furnace, which causes combustion of the fuel. Natural draught is created by a pressure due to the difference in weight of the column of heated and rarefied gases in the chimney, and that of a similar column of the surrounding atmosphere. Its intensity varies as the square root of the height of the chimney. Artificial draught is a forced current created by mechanical means, such as blowers acting beneath the fires, or by the rapid expulsion of the chimney gases by a "steam-jet."

The depth of the bottom of a vessel's keel below the surface of the water.

Draw. To pull; to attract; to procure. To procure anything on requisition or official demand. A sail *draws* when it is filled with the wind. A ship *draws* so many feet of water, according to the depth of her immersed body. *To draw upon* a ship is to gain upon a vessel in a chase. *To let draw the jib* is to cease from flattening in the sheet. *To draw off*, to move away. *To draw the guns*, to draw the charges.

Draw-net. See Drag-net.

Drayton, Percival, Captain U.S.N. Born in South Carolina, August 25, 1812; died at Washington, D. C., August 4, 1865. Son of Hon. William Drayton, M.C. Midshipman, December, 1827; lieutenant, February 28, 1838; was attached to the observatory, Washington, in 1852; commander, September 14, 1855; joined the Paraguay expedition in 1858, and from 1860 until the outbreak of the civil war was on ordnance duty at Philadelphia. Though strongly bound by family ties to the seceding States, he remained loyal to the national flag, and in the expedition to Port Royal commanded the steamer "Pocahontas"; his brother, Gen. T. F. Drayton, commanded at the same time the Confederate troops at Hilton Head Island. He was afterward transferred to the "Pawnee," and July 16, 1862, was promoted to captain, and ordered to the new Ericsson iron battery "Passaic." He was in the bombardment of Fort McAllister; in the attack on Sumter by Dupont; fleet-captain of the West Gulf Squadron, under Farragut, and was in the "Hartford" at the fight with and capture of the rebel fleet in Mobile Bay, August 5, 1864. He was particularly distinguished as Farragut's chief-of-staff. Appointed chief of the Bureau of Navigation, April 28, 1865.

Dredge. An instrument for scraping up oysters or specimens of the bottom. To fish by dragging the dredge. To remove the mud, etc., from the bottom of a harbor or channel.

Dredging Machine. A large flat-bottomed boat equipped with a steam-engine and machinery for removing mud, etc., from a harbor or channel.

Dredgy. The ghost of a person drowned.

Dreint. An old word for *drowned.*

Dress Ship. To ornament the ship by hoisting the national colors at the peak and mastheads, and setting the jack forward. When the ship is to be dressed *full*, the national flags are hoisted as before, and the signal-flags and pennants are arranged according to taste. When the signal-flags form a line from the water to the flying-jib-boom, over the mast-heads, to the end of spanker-boom and water, they are said to be arranged *rainbow-fashion.* When the ship is dressed in honor of a foreigner, person, or *fête*, the foreign national flag is given the place of honor,—the main. Aside from this, foreign flags are not used in dressing ship, as foreigners sometimes take offense if their flag is not given the prominence which they conceive to be due to it.

Drew. A name for the *Fucus lorcus*, a narrow, thong-shaped sea-weed.

Dribble. Drizzling showers; light rain.

Dries. A term opposed to *rains* on the west coast of Africa.

Drift. The deviation of a projectile from the plane of fire, due to the rifling of the gun; for a given range and calibre it depends upon the velocity of rotation as compared with that of translation, the weight and form of the projectile, and the position of its centre of gravity. The drift is *with* the rifling, and is allowed for by directing the axis of the bore sufficiently to the opposite side of the target to compensate for the deflection. Practically, this result is accomplished by a drift-piece attached to the rear sight, or by inclining the bar at a certain fixed angle to the left of the plane of fire. The angle at which the bar is set is called the "permanent drift angle."

An instrument to enlarge or clear a hole in metal. In wooden ship-building, the difference between the size of the bolt and the hole into which it is to be driven; for instance, if a bolt is made one-eighth of an inch larger than the hole into which it is to be driven, the bolt is said to have one-eighth of an inch drift; the same is applicable to a hoop which is to be driven on a mast.

The distance through which a current flows in a given time. Drift $=$ time $\times$ rate.

To be driven along on the water. To gather into heaps.

Drift-bolt. A long punch used for backing out other bolts.

Drift-ice. The débris of the main pack.

Drift-mud. Argillaceous earth brought down by streams and deposited in banks.

Drift-sail. A sail used as a drag (which see).

DRIFT-WOOD. Wood floating on the surface of the water.

Drifts. Those parts where the sheer is raised according to the heights of the decks, and where the rails are cut off and ended by scrolls.

DRIFT-PIECE. A solid piece fitted at the drifts to form the scrolls.

Drill. Practice at the various military and nautical exercises.

Drive. A ship *drives* when her anchor trips or will not hold; she drives to leeward when beyond control of sails or rudder; and if under bare poles, may drive before the wind. To strike home bolts, tree-nails, etc.

Driver. A large sail formerly used with the wind aft or quartering. It was a square-sail cut like a studding-sail, and set with a great yard on the end of the spanker-boom, across the taffrail. The name is sometimes applied to the spanker (which see). Formerly, the foremost spur on the bilge-ways, the keel of which was fayed to the foreside of the foremost poppet; it was cleated on the bilge-ways, and the sides of it stood fore and aft.

Driving Piles. The motion of a ship bobbing in a head sea, compared to the vertical fall of monkeys on pile-heads.

Drogher. A small craft in the West India Islands, to take off sugars, rum, etc., to the merchantmen. *Lumber-drogher* is a vessel built solely for burden, and for transporting cotton and other articles coastwise.

DROGHING. The carrying trade of the West India coasts.

Drogue. A drag (which see).

Droits of Admiralty (*Eng.*). Rights, or rather perquisites, which flowed originally from the king by grant or usage, and now reserved to the crown by commission. They are of two kinds, viz., the civil, or those arising from wrecks of the sea, flotsam, jetsam, and lagan, royal fishes, derelicts, and deodands, ejectamenta maris, and the goods of pirates, traitors, felons, suicides, and fugitives within the admiralty jurisdiction; and the prize droits, or those accruing in the course of war, comprehending all ships and goods taken without commission, all vessels improperly captured before hostilities have been formally declared, or found or by accident brought within the admiralty, salvage for all ships rescued, and all ships seized, in any of the ports, creeks, or roads of the United Kingdom of Great Britain and Ireland, before any declaration of war or reprisals by the sovereign.

Dromond. A Saracen term for a large man-of-war.

Droop. See HOGGED.

Drop. The depth of a square-sail; but generally applied to the courses only, *hoist* being the corresponding term for the other square-sails. *To drop* a vessel is to distance her in a race or chase. *To drop astern*, to fall behind so as to suffer another vessel to pass beyond.

Drop-dry. Water-tight.

Droud. A fish of the cod kind, frequenting the west coast of Scotland.

Drouge. A piece of board, or kind of drogue, sometimes attached to the harpoon-line, to check in some degree the speed of the whale.

Drow. An old term for a severe gust of wind accompanied with rain.

Drown. To suffocate in water. To deluge with water. Drowning was an early naval punishment. Richard I. enacted that whoever killed a man on shipboard "should be bound to the corpse and thrown into the sea."

DROWNED, DIRECT METHOD OF RESTORING THE APPARENTLY.—This method is recommended by Dr. Howard:

1. *Arouse the patient.*—Unless in danger of freezing do not move the patient an inch; but instantly expose the face to a current of fresh air; wipe dry the mouth and nostrils; rip the clothing so as to expose the chest and waist, and give two or three smarting slaps on the stomach with the open hand.

If the patient does not revive, then proceed thus:

2. *To draw off the water, etc., from the stomach and chest.*—Turn the patient on his face, a large bundle of tightly-rolled clothing being placed beneath his stomach, and press heavily over it for half a minute, or so long as fluid flows from the mouth.

3. *To produce breathing.*—Place the patient on his back, the roll of clothing being so placed as to raise the pit of the stomach above the level of any other part of the body. If there be another person present, let him, with a piece of dry cloth, hold the tip of the tongue out of one corner of the mouth, and with the other hand grasp both wrists and keep the arms forcibly stretched back above the head. (This position prevents the tongue from falling back and choking the entrance to the windpipe, and increasing the prominence of the ribs tends to enlarge the chest. It is not, however, essential to success.)

Kneel beside or astride the patient's hips, and with the balls of the thumbs resting on either side of the pit of the stomach, let the fingers fall into the grooves between the short ribs, so as to afford the best grasp of the waist. Now, using your knees as a pivot, throw all your weight forward on your hands, and at the same time squeeze the waist between them, as if you wished to force everything in the chest upwards out of the mouth. Deepen the pressure while you can count slowly one, two, three, and then *suddenly* let go with a final push, which springs you back to your first kneeling position. Remain erect on your knees while you can count one, two; then repeat the same motions as before, at a rate gradually increased from 4 or 5 to 15 times a minute, and continue thus this bellows movement with the same regularity that is observable in the natural motions of breathing, which you are imitating.

Continue thus from one to two hours, or until the patient breathes. For a while after, carefully deepen the first short gasps into full breaths, and continue the drying and rubbing, which should be unceasingly practiced from the beginning.

4. *After-treatment.*—As soon as the breathing has become established, strip the patient, warm him in blankets only, put him in a bed comfortably warm, but with a free circulation of fresh air, and leave him to perfect rest. Give a little hot brandy and water, or other stimulant, every 10 or 15 minutes during the first hour, and as often thereafter as may be deemed expedient.

DROWNED, TREATMENT OF THE APPARENTLY.—This method is recommended by the Royal National Life-Boat Institution of Great Britain:

Send immediately for medical assistance, blankets, and dry clothing, but proceed to treat the patient *instantly* on the spot, in the open air, with the face downwards, whether on shore or afloat; exposing the face, neck, and chest to the wind, except in severe weather, and removing all tight clothing from the neck and chest, especially the braces.

The points to be aimed at are,—first, the *restoration of breathing;* and, secondly, after breathing is restored, the *promotion of warmth and circulation.*

The efforts to *restore breathing* must be commenced immediately and energetically, and persevered in for one or two hours, or until a medical man has pronounced that life is extinct. Efforts to promote *warmth and circulation*, beyond removing the wet clothes and drying the skin, must not be made until the first appearance of natural breathing; for if circulation of the blood be induced before breathing has recommenced, the restoration to life will be endangered.

To clear the throat, place the patient on the floor or ground with the face downwards, and one of the arms under the forehead, in which position all fluids will more readily escape by the mouth, and the tongue itself will fall forward, leaving the entrance into the windpipe free. Assist this operation by wiping and cleansing the mouth.

If satisfactory breathing commences, use the treatment described below, to promote warmth. If there be only slight breathing, or no breathing, or if the breathing fails, then:

To excite breathing, turn the patient well and instantly on the side, supporting the head, and excite the nostrils with snuff, hartshorn, and smelling-salts, or tickle the throat with a feather, etc., if they are at hand. Rub the chest and face warm, and dash cold water, or cold and hot water alternately, on them. If there be no success, lose not a moment, but instantly:

To imitate breathing, replace the patient on the face, raising and supporting the chest well on a folded coat or other article of dress. Turn the body very gently on the side, and a little beyond, and then briskly on the face, back again, repeating these measures cautiously, efficiently, perseveringly, about fifteen times in a minute, or once every four or five seconds, occasionally varying the side.

(*By placing the patient on the chest, the weight of the body forces the air out; when turned on the side, the pressure is removed, and air enters the chest.*)

On each occasion that the body is replaced on the face, make uniform but efficient pressure, with brisk movement, on the back, between and below the shoulder-blades, or bones on each side, removing the pressure immediately before turning the body on the side.

During the whole of the operations let one person attend solely to the movements of the head and of the arm placed under it.

(*The first measure increases the expiration, the second commences inspiration.*)

Whilst the above operations are being proceeded with, dry the hands and feet, and as soon as dry clothing or blankets can be procured strip the body, and cover or gradually reclothe it, taking care not to interfere with the efforts to restore breathing.

Should these efforts not prove successful in the course of from two to five minutes, proceed to imitate breathing by Dr. Silvester's method, as follows:

Place the patient on his back on a flat surface, inclined a little upwards from the feet; raise and support the head and shoulders on a small firm cushion, or folded articles of dress placed under the shoulder-blades.

Draw forward the patient's tongue, and keep it projecting beyond the lips; an elastic band over the tongue and under the chin will answer this purpose, or a piece of string or tape may be tied round them, or by raising the lower jaw, the teeth may be made to retain the tongue in that position. Remove all tight clothing from about the neck and chest, especially the braces.

Standing at the patient's head, grasp the arms just above the elbows; draw the arms gently and steadily upwards above the head, and *keep them stretched* upwards for two seconds. (*By this means air is drawn into the lungs.*) Then turn down the patient's arms, and press them gently and firmly for two seconds against the sides of the chest. (*By this means air is pressed out of the lungs.*)

Repeat these measures alternately, deliberately, and perseveringly, about fifteen times in a minute, until a spontaneous effort to respire is perceived, immediately upon which, cease to imitate the movements of breathing, and proceed to *induce circulation and warmth.*

To promote warmth and circulation.—Commence rubbing the limbs upwards with firm, grasping pressure and energy, using handkerchiefs, flannels, etc. (*By this measure the blood is propelled along the veins towards the heart.*) The friction must be continued under the blanket or over the dry clothing. Promote the warmth of the body by the application of hot flannels, bottles or bladders of hot water, heated bricks, etc., to the pit of the stomach, the armpits, between the thighs, and to the soles of the feet.

If the patient has been carried to a house after respiration has been restored, be careful to let the air play freely about the room.

On the restoration of life, a teaspoonful of warm water should be given; and then if the power of swallowing have returned, small quantities of wine, warm brandy and water, or coffee should be administered. The patient should be kept in bed, and disposition to sleep encouraged.

General observations.—The above treatment should be persevered in for some hours, as it is an erroneous opinion that persons are irrecoverable because life does not soon make its appearance. There is an authentic account of recovery after submersion for 20 minutes.

Appearances which generally accompany death.—Breathing and the action of the heart cease entirely; the eyelids are half closed; the pupils dilate; the tongue approaches to the under edge of the lips, and the lips and nostrils are covered with a frothy mucus. Coldness and pallor increase.

Cautions.—Prevent unnecessary crowding of persons around the patient. Avoid rough usage, and do not allow the patient to remain on his back unless the tongue be secured. Under no circumstances hold the body up by the feet. On no account place the body in a warm bath unless

under medical direction, and even then it should only be done as a momentary excitant.

DROWNING PERSONS, INSTRUCTIONS FOR SAVING.

1. When you approach a drowning person in the water, assure him, in a loud voice, that he is safe.

2. Before jumping in to save him, divest yourself, as far and as quickly as possible, of all clothes; tear them off if necessary; but if there is no time, loose, at all events, the foot of your drawers if they are tied, as, if you do not do so, they will fill with water and drag you.

3. On swimming to a person in the sea, if he be struggling, do not seize him then, but keep off for a few seconds till he gets quiet, for it is sheer madness to take hold of a man when he is struggling in the water; if you do, you run a great risk.

4. Then get close to him and take fast hold of the hair of his head, turn him as quickly as possible on to his back, give him a sudden pull and this will cause him to float, then throw yourself on your back also and swim for the shore, both hands having hold of his hair, you on your back and he also on his, and of course his back to your stomach. In this way you will get sooner and safer ashore than by any other means, and you can easily thus swim with two or three persons; the writer has even, as an experiment, done it with four, and gone with them forty or fifty yards in the sea. One great advantage of this method is that it enables you to keep your head up, and also to hold the person's head up you are trying to save. It is of primary importance that you take fast hold of the hair, and throw both the person and yourself on your backs. After many experiments it is usually found preferable to all other methods. You can, in this manner, float nearly as long as you please, or until a boat or other help can be obtained.

5. It is believed there is no such thing as a *death-grasp*, at least it is very unusual to witness it. As soon as a drowning man begins to get feeble and to lose his recollection, he gradually slackens his hold until he quits it altogether. No apprehension need therefore be felt on that head when attempting to rescue a drowning person.

6. After a person has sunk to the bottom, if the water be smooth, the exact position where the body lies may be known by the air-bubbles, which will occasionally rise to the surface, allowance being of course made for the motion of the water if in a tide-way or stream, which will have carried the bubbles out of a perpendicular course in rising to the surface. A body may be often regained from the bottom before too late for recovery by diving for it in the direction indicated by these bubbles.

7. On rescuing a person by diving to the bottom, the hair of the head should be seized by one hand only, and the other used in conjunction with the feet in raising yourself and drowning person to the surface.

8. If in the sea, it may sometimes be a great error to try and get to land. If there be a strong outsetting tide, and you are swimming either by yourself, or having hold of a person who cannot swim, then get on your back and float till help comes.

9. These instructions apply alike to all circumstances, whether the roughest sea or smooth water.

DROWNING THE MILLER. Adding too much water to wine or spirits.

Drub. To beat.

Drugger. A small vessel which formerly exported fish from Dieppe and other Channel ports, and brought back from the Levant spices and drugs.

Drum-fish. A genus of fishes (*Pogonias*) which make a peculiar drumming or grunting noise under water.

Drum-head. That portion of a capstan in which the bars are inserted.

Drumler. An ancient transport. (See DROMOND.) Also, a small piratical vessel of war.

Drummer. The marine who beats the drum. Also, a singular fish of the corvinas kind, which has the faculty of emitting musical noises, whence it has acquired the name of *crocros*.

Druxy. Timber in a state of decay, the condition of which is manifested by veins or spots of a whitish tint.

Dry-bulb Thermometer. The readings of this instrument, when compared with those of a wet-bulb thermometer, indicate the amount of moisture in the air.

Dry-dock. An artificial receptacle for examining and repairing vessels. See DOCKS.

Dry-ducking. Suspending a person by a rope above the surface of the water.

Dry-flogging. Punishing over the clothes of a culprit.

Dry-gales. Those storms which are accompanied with a clear sky, as the *northers* of the Gulf of Mexico, the *harmattan* of Africa, etc.

Dry Holy-stoning. See HOLY-STONE.

Dry-pipe. A prolongation or system of branches of the main steam-pipe, extending within a steam-boiler at the highest point possible, by which the steam is drawn through numerous small holes or narrow slits in its upper side equally from all parts of the boiler. Its object is to prevent priming and collect the steam in a dry state.

Dry-rot. This is the result of the growth of a parasitic fungus (*Polyporus hybridus** and other species of *Polyporus*) within the substance of wood, whereby it loses its elasticity and firmness, becomes brittle, and finally crumbles into dust. This result follows from the nutrition of the plant, which withdraws from the wood portions of its carbon and nitrogen, and so alters its composition. The fungus consists mainly of minute branching white threads (*mycelium*), which penetrate between the fibres of the wood, and are nourished at their expense. It may extend to all parts of a ship without producing fruit (spores), undermining the interior parts of timber, but avoiding the light and air, under cover of a thin shell of sound wood which conceals its ravages. It flourishes in dark, damp, and confined places, such as the frame-spaces of ships, and the inner parts of the planking which covers them. When the *Polyporus* fruits (which is seldom) it seeks the light and develops its spore-bearing organ (*pileus*), resembling a crust of dried white paint at the surface. On the external side of this crust are innumerable

* Nat. Ord. *Hymenomycetæ*, Fam. *Polyporei*.

minute pores, within which the spores are to be found, growing in fours on the summits of slender stalks (*basidia*), easily visible under a magnifying power of about 200 diameters. The mycelium may, however, be detected with the naked eye as white threads lying between the bundles of woody fibre and parallel with them. Under the microscope, the mycelium is seen to consist of very minute branching filaments, matted or felted together.

Since the dry-rot fungus flourishes only under the conditions of moisture, darkness, and confined air, its growth may probably be prevented on shipboard by such a system of construction as shall afford free ventilation of the bilges, frame-spaces (by boring through filling-chocks and by openings on the spar-deck), spaces beneath store-room floors, and recesses behind bulkheads; by forced ventilation, as now practiced in the U. S. S. "Richmond"; and by keeping the holds and lower decks dry. Extensive experiments are now (1880) being prosecuted by the Navy Department with a view to the preservation of ship-timber from decay, by impregnation under pressure with carbolic acid ("Burnettizing"), and with barium sulphate (the "Thilmany process"), from which good results are hoped for.

Besides the pecuniary loss resulting from the ravages of dry-rot, it appears to afford a peculiarly favorable nidus for the development of the yellow fever poison, and the preservation of its vitality against the unfavorable influence of cold weather. See YELLOW FEVER.

Other fungi, such as a cobweb-like growth on the under side of wet planks (*Helminthosporium*), molds, and patches of surface discoloration, are common on shipboard, but do not appreciably influence the decay of wood.—*J. H. Kidder, Surgeon U.S.N.*

Dub. A term for a pool of deep smooth water in a rapid river.

Dubb. To cut off and smooth with an adze the superfluous wood. *To dubb a vessel bright*, is to remove the outer surface of the plank completely with an adze. Spotting with the adze to examine planks is also dubbing.

Dubbah, or Dubber. A coarse leathern vessel for holding liquids in India.

Dubhe. A standard nautical star in the Great Bear, *α Ursæ Majoris.*

Dublin. The capital city of Ireland, on the Liffey, close to its entrance into Dublin Bay, Irish Sea, 66 miles W. of Holyhead, and 135 miles W. of Liverpool. Lat. 53° 23′ 2″ N.; lon. 6° 20′ 5″ W. The harbor has been latterly much improved, and near the mouth of the Liffey are the Grand Canal and the custom-house docks, the latter occupying 8 acres; depth at low water 12 feet, at high tides 24 feet. The bay is noble and picturesque, and esteemed one of the finest in the United Kingdom; it is about 7 miles in breadth at its entrance, between Howth Head, on the north, and Kingston, on the south. Pop. 246,300.

Ducat. A well-known coin in most parts of Europe. See MONEY.

Ducatoon. A coin of the Dutch Oriental Isles, value about $1.70. Also, a silver coin of Venice, value about $1.10.

Duck. To dive, or immerse another under water. The finest canvas for small sails is sometimes called *duck;* but it is really a lighter cloth than canvas, and is much used by seamen and soldiers in hot climates for frocks and trousers.

DUCKING. A penalty which veteran sailors inflict on those who, for the first time, pass the tropics, the equator, or formerly even the Strait of Gibraltar, and usually performed in a tub or half-butt, with the assistance of a few buckets of water; the usual fine, however, generally prevents the penalty being inflicted.

DUCKING AT THE YARD-ARM. A marine punishment formerly inflicted by the French for grave offenses; the criminal was placed astride a short thick batten, fastened to the end of a rope which passed through a block at the yard-arm. Thus fixed he was hoisted suddenly up to the yard, and the rope being then let go he was plunged into the sea. This operation was repeated several times, conformable to the sentence; a gun advertised the other ships of the fleet that their crews might become spectators. If the offense was very great he was drawn underneath the keel of the ship, which was called keel-hauling. See KEEL-HAULING.

DUCKS. The general name for a sailor's dress in warm climates.

Duck Up. To raise the clew of the mainsail or foresail when it interferes with the steering by shutting out the landmarks.

Dudgeon Wrath. An old word for the box-handle of a dirk.

Duds. A cant term for clothes or personal property. The term is old, but still in common use, though usually applied to clothing of an inferior quality.

Duel. In former days duels were of frequent occurrence in the navy, but latterly they are almost unknown. It is forbidden by the regulations to send or accept a challenge to fight a duel or act as second in a duel, and courts-martial are empowered to inflict any punishment for this offense, except death, flogging, or imprisonment at hard labor.

Duff. A sort of pudding. The posterior.

Duffer. A low peddler. A woman who assists smugglers. A stupid or cowardly fellow.

Dugong. An herbivorous mammal of the East Indian seas, intermediate between the *Cetacea* and the *Pachydermata*, having an elongated body, with flippers near the head, and terminated by a crescent-shaped tail.

Dug-out. A canoe hewn from one tree.

Duguay-Trouin, René, one of the most illustrious of French sailors, was born at Saint Malo, 10th of June, 1673, and died at Paris, 27th of September, 1736.

He came from a family of sailors, but was himself destined from childhood to be an ecclesiastic, going early to the College of Rennes, where he donned the soutane, and received the tonsure, with a view to succeeding to a rich benefice which friends of his family had in their gift.

His father died when he was only fifteen, and he was then sent to Caen to study philosophy. Here his sanguine temperament and love of pleasure caused him to break bounds, and he neglected his studies for the dissipations of a large city. His escapades at last became quite notorious, and he was forced by his family to return to Saint Malo, whence he was soon sent to sea in the *corsaire* "La Trinité," in which his

family had a large interest. This was in 1689. He remained in this vessel for two years, undergoing considerable hardship, but always distinguished for his conduct in numerous engagements with English and Dutch vessels.

After this apprenticeship, he went to sea in another vessel, of 18 guns, when he showed so much courage and conduct that he was given a command, being then only 18 years of age. After this he continually distinguished himself by attacks upon the English shipping, both in privateers and in vessels of the state. In 1694, while in command of the "Diligente," a 40-gun frigate, he was surrounded by an English squadron of six men-of-war, under Admiral Sir David Mitchell. After fighting for twelve hours, his crew were nearly all killed or wounded, he himself was wounded, and his ship on the point of sinking, so he was obliged to surrender. He was imprisoned at Plymouth, where he managed to make a friend of a pretty bumboat woman, and with her assistance escaped in a small boat, with his lieutenant, his surgeon, the boatswain, and a servant. After forty-eight hours of very rough weather they managed to reach the coast of Brittany.

He was soon at sea again, in a ship of 48 guns, in which he took two English men-of-war of superior force, one of which he brought in. For this action he received a sword of honor, and was invited to join the fleet of the Marquis de Nesmond, where he had his usual success in making prizes.

After this cruise he went to Paris, to be presented to Louis Quatorze, and received many honors while there. He did not remain long, however, returning to his sea-life, and had command of several small squadrons, which he handled with his accustomed ability, having been made *capitaine de frégate* of the royal marine.

After the peace of Ryswick he passed four years of enforced idleness; but upon the breaking out of the war of the Spanish succession, he was again promptly at sea, serving against the Hollanders and the English, in which he passed through many battles and many perils. In 1705, when thirty-two years of age, he was made *capitaine de vaisseau*, and very shortly after, in consequence of continued successes against the Portuguese, English, and others, he, with his elder brother (two younger ones had been killed while serving under him), received letters of nobility.

In 1711 he sailed, in command of a fleet of 7 line-of-battle ships, 8 frigates, and 2 bomb-vessels, with nearly 6000 men, for Rio de Janeiro. He entered the bay under the fire of the Portuguese batteries, and the next day disembarked his force. After some slight resistance the city was abandoned by its inhabitants. Duguay-Trouin then threatened to utterly destroy the place unless a handsome ransom was paid. This was done, and he then set out on his return to Brest, but lost two of his largest vessels on the voyage,—sunk in a hurricane. For this action he received a pension of 2000 crowns and the title of commandant of the marine of Saint Malo; and in 1715, at Versailles, he received the commission of admiral of the fleet.

Louis XIV. died soon after this, and Duguay-Trouin remained at Saint Malo in retirement until 1723, when, under the regency, he was made a councillor for India. In 1728 he was made commander of the order of St. Louis and lieutenant-general. The next year he was made commandant of marine of Brest and of the coasts of Brittany. In 1731 he commanded a fleet fitted out to punish the Barbary corsairs, but the appearance of the force so imposed upon the Moors that they gave every satisfaction without any fighting. Although he continued in service, this was his last active employment. His labors and exposure had undermined a naturally vigorous constitution, and he died in Paris at 63 years of age.

Duguay-Trouin was so disinterested and generous that, in spite of his many captures, he died comparatively poor. His officers and sailors fairly worshiped him, not only on account of his intrepidity, but because of his liberality in regard to prize-money. A statue of him is erected in the "Place Duguay-Trouin," at Saint Malo.

A portrait of this intrepid sailor is in the city hall, and in the museum at Versailles is a statue of him in black marble. The portrait represents him in a rich military costume, decorated with the order of the Holy Ghost. On his bandolier are the arms granted him by Louis XIV.,—two fleur-de-lis and an anchor. He holds a pistol in his right hand, while the left grasps the hilt of his sword. His hat is ornamented with plumes, which, in our day, is not considered naval. There is also a statue of Duguay-Trouin in the Bourse, at Nantes, and there are two other well-known oil-paintings of him. He is represented with a youthful and animated countenance, wears a huge wig, and a coat above his cuirass.

His arms appear upon the picture (given by Louis XIV.),—the fleur-de-lis and anchor,—and the legend, "Didit hæc insignia virtus."—*E. Shippen.*

Duke of York (*Eng.*). A nickname for a peculiar storm-trysail used in the northern seas.

Dulce, Dulse, Delse. One of the edible fuci, *Iridea dulce.* It is plentiful on the rocky coasts of Ireland and western England. It probably derived its name from being sweet and pleasant, not requiring cooking.

Duledge Plate. An old name for the tire or iron plate on the circumference of the wheel of a field-piece. Duledge was also used for dowel, the wooden pin connecting the felloes.

Dull'd. Fallen or moderated; said of the wind.

Duluth. A city and port of entry of Minnesota, the capital of St. Louis Co., is finely situated at the W. end of Lake Superior, and is the eastern terminus of the Northern Pacific Railroad. Lat. 46° 48′ N.; lon. 92° 6′ W. Duluth has a very advantageous position for a commercial city, being at the head of navigation on the great lakes. Pop. 3300.

Dumb-chalder. A metal cleat bolted to the back of the stern-post for one of the pintles to rest upon, to lessen both strain and friction.

Dumb-craft. Lighters, lumps, or punts, not having sails. A name for the screws used for lifting a ship on the slip.

Dumb-pintle. A peculiar rudder-strap.

Dumb-scraping. Scraping wet decks with blunt scrapers.

Dumb-sheave. An aperture without a sheave, through which is rove a rope.

Dumfounder. To confuse or perplex.

Dummy. A wood frame landing-place in front of a pier.

Dump-bolt. A short bolt, not driven through two pieces of timber; sometimes called a *blunt-bolt.* Also, in wooden ship-building, a fictitious bolt, sometimes driven into knees,—merely a short piece of iron with a head on it to make the fastenings appear regular.

Dumps. Nearly synonymous with *down in the mouth.*

Dunbar Medlar. A salted herring.

Duncan, Admiral (Lord Camperdown). Born in 1731, at Dundee, Scotland; entered the navy as midshipman in 1746; became lieutenant in 1755, and in 1761 commander of the "Valiant," of 74 guns; in 1789 appointed rear-admiral of the blue, and in 1793 vice-admiral of the blue.

Although this truly good and gallant man saw much service under Admiral Keppel and Lord Howe in Africa, America, and the Mediterranean, it was not until he obtained independent command in the North Sea that he had a chance of distinguishing himself. By the exercise of patience, constancy, and cool courage he was enabled to draw an immense Dutch fleet out of the Texel, and after a long and severe encounter, in October, 1797, to completely beat his enemy and capture nine large line-of-battle ships (including that of the famous De Wister) and two frigates. For a victory so acceptable to the nation Duncan was created a viscount, with a pension of £2000 a year, and his title (Lord Camperdown) was derived from the locality of the fight. Died August 4, 1804.

Dunderhead. A term used for a stupid fellow.

Dun-diver. A name for the goosander (*Mergus merganser*) in immature plumage.

Dundonald, Earl. Born December 14, 1775. While still a boy obtained a commission in the 104th Regiment. At the age of 17, however, he joined the "Hind" corvette, commanded by his uncle, Capt. Sir Alexander Cochrane, and began the career in which he was destined to win so much renown.

In April, 1809, a French fleet having assembled in Basque Roads for the purpose of protecting Martinique, then threatened by an English force, Admiral Gambier was deputed to blockade the French in the roads. In this enterprise he was assisted by Lord Cochrane, afterwards Earl of Dundonald, an officer of singular intrepidity. To prevent the ingress of the British ships of war the French admiral caused a barrier to be constructed of booms and spars lashed together and anchored at either end. With twelve fire-ships Lord Cochrane dashed through the obstruction and advanced towards the fleet of the enemy. Those of the French fleet that escaped being burnt or blown up were run ashore by the French admiral. Thus was the purpose of the French utterly frustrated. Commander-in-chief on the North American and West India Station. In 1851 he was vice-admiral of the white, and in 1854 rear-admiral of the United Kingdom, a distinction which he held to his death. He died October 31, 1860.

Dunes. An Anglo-Saxon word still in use, signifying mounds or ridges of drifted sands. See Downs.

Dun-fish. A peculiar preparation of cod, by which it retains a dun or dark yellow color.

Dungaree. A kind of blue cotton stuff used for working-clothes by the cooks, and for facings for collars and cuffs. At present the regulations require that the cuffs and collars shall be of blue flannel.

Dungaree-duck. A name given to a small dried fish in Bombay.

Dungiyah. A broad-beamed flat-bottomed Arabian coaster trading between the Red Sea, Gulf of Persia, and the Malabar coast.

Dunkirk. A fortified seaport town, and the northernmost of France, department of Nord, on the Strait of Dover, 40 miles N.W. of Lille, and 45 miles E. of Dover, at the junction of three canals and of several railways. It has a heavy trade and important fishery. It has two harbors, with extensive docks, a breakwater, and other artificial improvements. Pop. 35,100.

Dunkirks. The well-known name for pirates who sailed out of Dunkirk.

Dunlin. The name of a species of sandpiper (*Tringa cinclus*).

Dunn, Edward T., Paymaster-General U.S.N. Born in District of Columbia. Appointed from District of Columbia, February 21, 1831; attached to sloop "John Adams," Mediterranean Squadron, 1833–34; schooner "Boxer," Pacific Squadron, 1835; sloop "Vincennes," Pacific Squadron, 1836; frigate "Macedonian," West India Squadron, 1837–40; receiving-ship, Norfolk, 1845; frigate "Columbus," East India Squadron, 1846, and in the Pacific Squadron during the Mexican war; navy-yard, New York, 1850–51; frigate "Columbia," Home Squadron, 1852–55; navy-yard, Norfolk, 1857–60; sloop "St. Mary's," Pacific Squadron, 1861–63; Fleet-paymaster, West Gulf Blockading Squadron, 1863–65; paymaster at Baltimore, 1866–69; chief of Bureau of Provisions and Clothing, 1870–73. Commissioned as paymaster-general in 1871; placed on retired list in January, 1873; detached from the bureau in February, 1873, and ordered on special duty to Naval Station, New Orleans, and navy-yards at Pensacola and Mare Island; returned to Washington in August, 1873; retired, having attained the age of 62, in 1874.

Dunnage. Loose wood or other substances, as horns, rattan, coir, etc., to stow among casks and other cargo to prevent their motion. See Stowage.

Dunnage Battens. An extra floor in a merchantman to preserve the cargo from wet in the event of leakage.

Dunnage-gratings. Gratings on which cargo is stowed.

Dunter. A name for the porpoise.

Dupont, Samuel Francis, Rear-Admiral U.S.N. Born at Bergen Point, N. J., September 27, 1803; died in Philadelphia, June 23, 1865; grandson of P. S. Dupont Nemours. Midshipman in the navy at 12; lieutenant, April 26, 1826; commander, October 28, 1842. In 1845 he was ordered to the Pacific in command of the frigate "Congress," and during the Mexican war saw much active service on the Californian coast. In the "Cyane," he captured San Diego; cleared the Gulf of California of Mexican vessels; took La Paz, the capital of Lower California; assisted in the capture of Mazatlan in November, 1847, and defended Lower California against the Indians and Mexicans. In Feb-

ruary, 1848, he landed at San José with a hundred marines and sailors and defeated and dispersed a Mexican force five times as great. Captain, September 14, 1855. Having recommended the occupation of Port Royal as a central harbor or depot on the southern coast, he was given the command of the South Atlantic Blockading Squadron, and intrusted with the attack on that place. Sailing from Fortress Monroe, October 29, 1861, in the "Wabash," with a fleet of 50 sail of war vessels and transports, conveying Gen. Sherman's troops, he arrived off Port Royal November 4 and 5, after a violent storm, and on the 7th attacked and captured two strong forts on Hilton Head and Bay Point, which defended the harbor. He followed up this advantage vigorously, and his operations along the southern coast were invariably successful. He also succeeded in making the blockade more effective than before. July 16, 1862, he was made a rear-admiral on the active list. In April, 1863, he commanded the fleet which unsuccessfully attacked Charleston. He was soon after relieved of the command of the South Atlantic Blockading Squadron, and subsequently held no active command. Admiral Dupont aided in organizing the naval school at Annapolis, and is the author of a report on the use of floating-batteries for coast defense, which has been republished and highly commended in England by Sir Howard Douglas in his work on naval gunnery.

Duquesne, Abraham, Marquis, lieutenant-general of the sea forces, and one of the greatest seamen France ever produced, was born at Dieppe in 1610. Entering the navy early, he soon rose to the command of a small vessel, in which he joined in the recapture of some of the French islands from the Spaniards, for which service he was reported most favorably to Richelieu. During the operations he learned of the death of his father, in action with the Spaniards, and Duquesne seems to have ever after entertained the most lively dislike for that nation, causing them to feel the effects of his resentment on numberless occasions. In 1638 he, under circumstances of great difficulty and peril, rescued from under the guns of St. Sebastian several French vessels which had been stranded there. The same year, at the battle of Gattari, Duquesne decided the victory by blowing up the Spanish admiral's flag-ship by means of a fire-vessel.

In 1639 he served in the naval operations on the Biscayan coast, and at the capture of Laredo and Santona. At the latter place he was dangerously wounded by a bullet in the jaw while boarding a galleon.

During 1641 he served in the Mediterranean against the Spaniards, was constantly engaged, and again wounded. Two years afterwards he was again actively engaged on the coast of Spain, participating in the battles off Cape de Gatte (where he was again wounded) and at Carthagena.

Richelieu having died, the French navy fell into neglect, and Duquesne took temporary service under the Swedish crown, which was then engaged in a naval warfare with Denmark. Queen Christina received him very cordially, giving him at first the rank of major-general, and afterwards that of vice-admiral.

In the latter capacity he bore a part in the naval engagement of 1644, under Nicolas Flemming and Torstensen, against the old king Christian IV. of Denmark. He also served in the naval battle off the island of Fremeren, under the command of Admiral Wrangel, the Danish fleet being commanded by Admiral Prosmond.

Peace between Sweden and Denmark being shortly after this concluded, Duquesne retired from the Swedish service and returned to France. In 1645 he was again actively employed against Spain, and in the following year was once more wounded, in a naval battle upon the coast of Italy.

In 1647, being then a *capitaine de vaisseau*, he was sent to Sweden to purchase four vessels of the line for the French navy, after which he assumed command of the squadron of Dunkirk, in French Flanders, which position he retained for five years.

In 1653 occurred the naval operations of the Duke de Vendôme about the mouth of the Gironde, consequent upon the civil war of the Fronde. The French navy had by this time so decreased that the duke, in summoning Duquesne from the North Sea to his assistance, was obliged to ask the latter to man and equip some of the vessels at his own expense. On his way down the channel to join the duke, Duquesne met an English squadron, which summoned him to strike his flag,—a token of submission at that time imposed upon all foreigners by the English, if within Ushant or even Finisterre. To the demand Duquesne returned a haughty refusal, whereupon a very close and murderous engagement took place, which resulted in the English (although quite equal in guns to the French) being put to flight. On arriving off the Gironde a Spanish squadron, operating in connection with the insurgents, attempted to bar his progress; but he drove them off and succeeded in joining the Duke de Vendôme, and greatly assisted in the reduction of Bordeaux and all Guyenne.

In recognition of his services Anne of Austria bestowed upon Duquesne a chateau and estate in Brittany, with a promise of further reimbursement for his expenses in fitting out his squadron. The peace of the Pyrenees, signed in 1659, for a time relegated Duquesne to civil life. But Colbert, during this cessation of arms, had the wisdom to imitate Richelieu in fostering and rebuilding the navy of France, so that when war broke out, in 1672, between France and Holland, the former was able to at once send to sea a formidable fleet.

During this same year Duquesne took part, with a high command, in the great naval battles which took place in the North Sea; particularly those off Southwood, where Vice-Admiral d'Estrées was opposed to the Dutch Admiral Benkaërt, and the two battles where the combined French and English fleets, under Prince Rupert, Admiral Spragg, and D'Estrées, fought the Hollanders under Ruyter, Cornelis Tromp, and Benkaërt.

England suddenly made peace with Holland, but France continued the war, with the alliance of Spain, Germany, and the Two Sicilies. An insurrection occurring in Sicily, Louis XIV. resolved to sustain the revolutionists, and Du-

quesne, who was by this time lieutenant-general of the naval forces of France, sailed from Toulon, in January, 1675, in command of a strong fleet, destined for Sicily.

In sight of the coast of that island he was attacked by a Spanish fleet much his superior in force, which he not only succeeded in repelling, but actually drove his opponents to take refuge at Naples, and successfully conducted to a safe harbor in Messina a large convoy, with provisions and munitions of war.

He soon returned to France for provisions and stores, so necessary to the French in their operations in Sicily, and while at Toulon, preparing to return, learned that the celebrated Admiral de Ruyter had entered the Mediterranean, with the purpose of operating in conjunction with the Spaniards, and soon after received orders to take command of a strong fleet and to go to meet the great Dutch admiral.

Duquesne was now about 64 years of age. He sailed in December, 1675, with a fleet of 20 ships of the line and 6 fire-ships, direct for Messina. Ruyter no sooner learned that he was at sea than he used all means to encounter him, giving out that his purpose was to fight and conquer the brave Duquesne. *Par nobile fratrum.*

The opposing fleets met off the Lipari Islands, on the 7th of January, 1676, and passed the entire day in manœuvring, and the succeeding night in working for the weather-gage.

Next morning Duquesne found himself to windward, and bore down to engage Ruyter. The French fleet was in three divisions, the centre commanded by Duquesne, in the "Saint Esprit." The Dutch fleet was also in three divisions, and consisted of 24 sail of the line, 2 ships armed *en flûte*, and 4 fire-ships.

The French fleet came down in perfect order, and the battle opened at 9 A.M., the engagement soon becoming general. It was stubbornly contested, and lasted, with varying fortunes, for four hours and a half, the result being that the Dutch fleet, which had intended to bar Duquesne's passage, was so handled that the French admiral was able to anchor in Messina on the next day. During this action the two flag-ships exchanged many broadsides, in which encounters the Dutch had rather the advantage.

Both fleets having been refitted and reinforced, they met again on April 22, 1676; Duquesne having 30 ships of the line and 8 fire-ships, and Ruyter 29 ships of the line, 9 galleys, and 4 fire-ships.

When the action became general the admirals' ships engaged each other, and Ruyter was wounded in several places. After a tremendous battle the Dutch vice-admiral, De Haan, drew off his forces at sunset, and took refuge in the close port of Syracuse, Duquesne keeping the sea on the site of the battle, with his battle-lanterns burning. Next day he appeared off Syracuse, but without being able to draw out his opponents.

Ruyter died of his wounds within a few days, and the whole operation was a great victory for Duquesne. On May 26 of the same year the French fleet attacked the allied fleet in the Bay of Palermo, and the fire-ships of Duquesne blew up twelve Dutch and Spanish vessels, and with them Admiral De Haan, Admiral Don Diego Ibarra, and others; the French loss being comparatively small.

Upon his return from this action Duquesne met the "Concordia," which ship was carrying back to Holland the remains of the illustrious De Ruyter. Giving her free passage, he saluted the remains in an appropriate manner. Louis XIV. ordered all the forts and batteries in sight of which the Dutch vessel bearing his remains passed to salute. See Ruyter.

When it came to recompensing Duquesne for all his long and arduous and distinguished services, Louis XIV. required him to renounce the Protestant faith, promising him a marshal's baton and other honors. Duquesne simply replied that if he was a Protestant his services were Catholic. He received the domain of Du Bouchet, and was made marquis by letters dated February, 1681.

He continued to serve at sea, though now an old man. Among other exploits of this date, he burned some Spanish vessels in the harbor of Barcelona.

After the peace of Nimeguen he kept very quiet, and seldom went to court,—an unusual thing in those days, especially for those who had claims to distinction.

In 1682 he was sent with a fleet against the Moors of Algiers, which city he bombarded for several days with great effect, but was forced by the weather to return and winter at Toulon. In June, 1683, he appeared before Algiers again, completely reducing the place, so that the population rose against the dey. The French slaves were given up, but Mezzo Morto, who had succeeded to the dey slain by the insurgents, renewed the defense, when the bombardment was continued by Duquesne to an extent which rendered the Algerines harmless for a long time, by destroying all their vessels and naval stores.

Two years afterwards—1684—Duquesne commanded the French fleet which bombarded Genoa, and, at different times, inflicted so much damage as to oblige the doge and four senators to come to Versailles, to beg pardon, in person, from the king. It was on this occasion that the doge was asked what he found most surprising in Versailles, and answered "that it was to find himself there." The Genoese expedition was Duquesne's last service. He had served sixty years. The revocation of the Edict of Nantes distressed the veteran seaman beyond measure. He alone of all the Protestants of France was excepted from proscription, and retained his rank and honors, but his children and friends, his relatives and co-religionists, were banished, and this had a most depressing effect upon the veteran admiral, and, no doubt, hastened his death.

He died at Paris on February 2, 1688, aged 78 years. By his last words he implored his eldest son not to serve against his country, as many of the exiled Huguenots were then doing. So great was the feeling at the time of his death that his remains were privately buried, his son's request to have them sent to him, in Switzerland, being refused; but he erected a tablet to his memory. This was a great contrast to the splendid obsequies and tomb given by Holland to his adversary, Ruyter.

Louis XVI. afterwards made some reparation for this treatment of a great French naval hero, by placing Duquesne's portrait in the royal apartments at Versailles, and in 1844 the city of Dieppe erected a bronze statue in his honor.

One of the large vessels of the French navy is generally called "Duquesne."—*E. Shippen.*

Dur-mast. An inferior kind of oak of rapid growth.

Dust. Broken particles of hard bread.

Dutch. The people of Holland. The language spoken in Holland; hence any gibberish or language which Jack does not understand.

DUTCH-CAPER. A light-armed vessel of the 17th century, adapted for privateering, and much used by the Dutch.

DUTCH CONSOLATION. Negative consolation.

DUTCH COURAGE. The excitement inspired by drinking spirits; false energy.

DUTCH EEL-SKUYT. A flat-bottomed cutter-rigged sea-boat, carrying lee-boards, fitted with two water-tight bulkheads, making a well for keeping live fish in, the water being admitted through perforated plates fastened on inside the ribs.

DUTCHIFYING. A term used for converting square sterns to round ones.

DUTCHMAN'S BREECHES. The patch of blue sky often seen when a gale is breaking is said to be, however small, "enough to make a pair of breeches for a Dutchman." Others assign the habiliment to a Welshman, but give no authority for the assumption.

DUTCH PLAICE. The *Pleuronectes platessa.* When small, it is called fleak; when large, Dutch plaice.

DUTCH PUMP. A punishment so contrived that, if the prisoner would not pump hard, he was drowned.

DUTCH RECKONING. A bad day's work, all in the wrong.

DUTCH REDS. High-smoked herrings prepared in Holland.

Duttees. Coarse brown calicoes of India.

Duty. The exercise of those functions which belong to the service, and are carried out from the highest to the lowest. See CUSTOMS.

D-valve. A slide-valve provided with semi-cylindrical ends around which steam-tight packing is placed, thus relieving the valve-faces and valve-seat of the steam-pressure to which the unbalanced plain slide-valve is subjected. The friction of the packing, however, when insuring a steam-tight joint, is about equal to that due to the steam-pressure, and the device is now obsolete. It was formerly in extensive use in British steam-engines.

Dyce, or Thyst. See DICE.

Dyelle. A kind of mud-drag used for cleaning rivers.

Dying Man's Dinner. A snatch of refreshment when the ship is in extreme danger.

Dyke. From the Anglo-Saxon *dic*, a mound or bank.

Dyke-cam. A ditch-bank.

Dynamite. See EXPLOSIVES.

Dynamometer. An instrument for measuring force or power, especially that of animals or machines.

E.

Eager, or Eagre. The whole of the flood-tide moving up a river in one tidal wave, or in two or three successive waves. The name seems to be derived from the Anglo-Saxon *eágor*, water, or *Ægir*, the Scandinavian god of the sea. See BORE.

Eagle, Henry, Commodore U.S.N. Born in New York. Appointed midshipman from that State, January 1, 1818.

Commissioned as lieutenant, March 3, 1827; in sloop "Natchez," West Indies, 1827; frigate "Hudson," Brazil, 1829–31; receiving-ship, at New York, 1833–34; sloop "Erie," Brazil, 1835–37; rendezvous, New York, 1840; sloop "Yorktown," Pacific, 1841–42; commanding schooner "Shark," Pacific, 1843–44.

Commissioned as commander, June 4, 1844; superintended the construction of Stevens's iron ship, Hoboken, N. J., for three years, to 1846; inspector, etc., at New York, 1846; commanding bomb-vessel "Ætna," and a division of the squadron of five vessels during the Mexican war; stationed at Tabasco, also civil and military governor of the province, and collector of the port, 1847–48; special service, 1851; commanding steamer "Princeton," Home Squadron, 1854–55.

Commissioned as captain, September 14, 1855; volunteered for the command of gunboat "Monticello," in April, 1861, and was in command of her during the attack on Sewell's Point Battery, Virginia, May 19, 1861; commanding frigate "Santee," Gulf Squadron, 1861–62. The boats of the "Santee" captured the privateer "Royal Yacht," Galveston harbor.

Commissioned as commodore, July 16, 1862; prize commissioner, New York, 1864–65; light-house inspector, 1865–66. Retired January 1, 1863.

Eagle. The standard of the eagle was first borne by the Persians; and the Romans carried figures of the eagle, as ensigns, in silver and gold, and sometimes represented with a thunderbolt in its talons, on the point of a spear; they adopted the eagle in the consulate of Marius, 102 B.C. When Charlemagne became master of the whole of the German empire, he added the second head to the eagle for his arms, to denote that the empires of Rome and Germany were united in him, A.D. 802. The eagle was the imperial standard of Napoleon; and is that of Austria, Russia, and Prussia. It is also the national emblem of the United States of America.

A gold coin of the value of $10. See SPREAD-EAGLE.

Eagle-ray. A large species of ray-fish (*Myilobatis aquila*); called also *miller*.

Ear. A lug cast on old projectiles of great

weight, for convenience in handling. *Ears of a boat*, an old term for the knee-pieces at the bow on the outside at the gunwale height.

Earing. A small line used to fasten the upper corners of a sail to the yard or gaff, or the corners of an awning to the rigging or stanchions. Those at the upper corners of a square-sail are called *head-earings* to distinguish them from the *reef-earings*.

EARING, BULL-. An earing to haul out the edge of an awning. An earing composed of two ropes spliced into each other and marled together, forming an eye, which goes over the topsail yard-arm; used for the first and second reefs.

EARING-CRINGLE. The cringle through which an earing is passed.

EARING, HEAD-. See EARING.

EARING, REEF-. See REEF-EARING.

Earne, or Erne. The sea-eagle.

Earth. The globe which we inhabit. It is the third planet in order from the sun, and the largest within the belt of the planetoids. It is in form an oblate spheroid, the equatorial diameter being 7925.6 miles, and the polar 7899.1 miles,—the polar compression being about $\frac{1}{300}$ of the diameter. The surface of the earth contains nearly 150,000,000 square miles. The earth moves around the sun in an ellipse, the journey being performed in about 365¼ days. The least distance of the earth from the sun is over 94,000,000 miles, and the greatest is over 96,000,000, the mean distance being about 95,000,000. The velocity of the earth in its orbit is about 19 miles per second. The earth has also a daily motion on its axis, the velocity increasing from the pole, being about 1440 feet per second at the equator.

The globular form of the earth, the five zones, some of the principal circles of the sphere, the opacity of the moon, and the true cause of lunar eclipses, were taught, and an eclipse predicted, by Thales of Miletus, about 640 B.C. Its magnitude was calculated from measuring an arc of the meridian by Eratosthenes, 240 B.C. The Greeks taught the sphericity of the earth, and the popes believed it to be a plane, and gave all towards the west to the kings of Spain. Pythagoras demonstrated from the varying altitudes of the stars by change of place, that the earth must be round; that there might be antipodes on the opposite part of the globe; that Venus was the morning and evening star; that the universe consisted of twelve spheres,—the sphere of the earth, the sphere of the water, the sphere of the air, the sphere of fire, the spheres of the moon, the sun, Venus, Mercury, Mars, Jupiter, Saturn, and the sphere of the stars, about 506 B.C. Aristarchus, of Samos, maintained that the earth turned on its own axis, and revolved about the sun; which doctrine was held by his contemporaries as so absurd, that the philosopher had nearly lost his life to his theory, 280 B.C.

The notion of its magnetism was started by Gilbert in 1576. The experiments of M. Richer, in 1672, led Newton to prove the earth to be in the shape of an oblate spheroid. The variation of its axis was discovered by Dr. Bradley in 1737. The first voyage round the globe was performed by Picaro, commanding a ship of Magellan's squadron, 1520–24. The first English navigator who performed the same enterprise was Sir Francis Drake, 1577.

Ease. *To ease away* or *to ease off* is to slack off a rope carefully. *To ease the helm* is to put the helm more nearly amidships, to lessen its effect on the ship, or to lessen the strain on the wheel rope. *Ease her*, applied to the engine, means to reduce the speed.

East (Ang.-Sax. *y'st*). The cardinal point in that part of the horizon where the heavenly bodies rise. The east and west points are the points in which the prime vertical intersects the horizon; and they are the origins whence amplitudes are reckoned.

EASTING. The distance in nautical miles which a ship makes to the eastward; it is the *departure* when sailing eastward.

Eastport. A port of entry of Washington Co., Me., on Moose Island, in Passamaquoddy Bay, 25 miles S.S.E. of Calais, and 100 miles E. of Bangor. The tide rises about 25 feet, and prevents the ice from obstructing the harbor. The town is on the eastern frontier of the United States; principally supported by the fisheries, lumber business, and coast trade. Pop. 3200.

Easy. A ship rolls *easy* when she rolls slowly and smoothly without sudden jerks. *Easy draft* is the same as *light draft.*

Eat. To make progress against a difficulty by slow degrees; as, to eat to windward. *To eat the wind out of a vessel* is to gain to windward of her by close attention to the helm, and developing the sailing powers to the utmost.

Ebb. The running out of the tide,—from the Anglo-Saxon *ep-flod.* See TIDE.

EBB, LINE OF. The strip of beach left dry by the tide.

Eburna. A genus of gasteropodous mollusks, having a smooth shell covered with a shining enamel.

Eccentric. A circular disk keyed on and revolving with a shaft, with the axis of which its centre does not coincide. It is used to convert a rotary motion to reciprocating motion, as in the valve-gear of steam-engines, and is equivalent to a crank having the distance between the crank-pin and shaft axis the same as the distance between the centre of the eccentric disk and the axis of the shaft. This device can be applied to shafts of all diameters without impairing their strength.

ECCENTRIC-HOOK. A hook or notch in one end of an eccentric-rod, by means of which the eccentric motion is readily connected with or detached from the remaining portion of the valve-gear, thus enabling the valves of an engine to be worked by the starting-bar and hand-gear. It is sometimes called a *gab.*

ECCENTRIC-HOOP, or STRAP. An adjustable band encircling an eccentric, which revolves within it, and to which the eccentric-rod is rigidly attached.

ECCENTRIC-ROD. A rod or bar, one end of which is rigidly secured to an eccentric strap or hoop, and the other end connected with such reciprocating parts of machinery as a Stephenson link, valve-stem cross-head, or rock-shaft arm of the valve-gear of a steam-engine. In engines that require to be worked by hand in starting, the end of the eccentric-rod is connected to the other valve-gear by an easily detached hook. See ECCENTRIC-HOOK.

Echineis. A genus of fishes, including the sucking-fish, or remora.

Echinus. A genus of Echinoderms; sea-urchin (*Echinus esculentus*); sea-hedgehog.

Eclipse (Gr. *ekleipsis*, from *ekleipein*, to leave out; to suffer a disappearance). The disappearing, in whole or in part, of a heavenly body in consequence of the intervention of another body.

A *lunar eclipse* takes place when the moon is in opposition, or on the opposite side of the earth from the sun (and when, therefore, it is full moon), provided she is at the same time very near one of her nodes, or the points where her orbit crosses the plane of the ecliptic. If the full moon is in the node, it will also be in the axis of the earth's shadow, and the eclipse will be *central*, possibly continuing for two hours, as the breadth of the shadow where the moon crosses it is about $2\frac{2}{3}$ the moon's diameter; when the full moon is so near the node as to be wholly immersed in the shadow, the eclipse will be *total;* and when only a part of the disk is immersed, the eclipse will be *partial.*

Instead of the earth and moon, we may contemplate any other planet that has a satellite. The satellite is eclipsed in the shadow of the planet, such phenomenon being to a spectator on the surface of the planet a lunar eclipse. We observe also the shadow of the satellite passing over the disk of the planet. By a spectator on a portion of the surface of the planet in such a case, a solar eclipse would be experienced; but as viewed from the earth, such a phenomenon is described as a *transit of the shadow* of the satellite.

The second case is where a body is eclipsed by the spectator passing through the shadow of the intervening body, the appearance being different according to the position of the spectator. This occurs in *solar eclipses.* When the moon is in conjunction—*i.e.*, in the same part of the heavens with the sun (and when, therefore, it is new moon)—the intersection of the moon's conical shadow with the earth's surface produces a black spot which sweeps over the illuminated hemisphere of the earth from west to east, and resembles in its effects a cloud carried by a west wind which hides the sun from the places nearly below it. To places over which the umbra passes, there will be a *total* eclipse; those places which the penumbra reaches will experience a *partial* eclipse. In case the umbra of the moon does not extend as far as the earth —or, in other words, when the moon's apparent diameter is less than that of the sun—a spectator below the centre of the umbra will see an *annular* eclipse, the dark disk of the moon being surrounded by a luminous "ring" of the sun's disk.

There is another class of phenomena analogous to eclipses, and which are sometimes included in the term. These are *occultations* and *transits.* An *occultation* is the hiding of a heavenly body from view by an apparently larger body intervening between it and the spectator. Thus the moon interposes and causes occultations of fixed stars and planets; the planets hide from view their satellites. A *transit* is the passing of a small body across the disk of a larger one. Thus, we have transits of the inferior planets, Mercury and Venus, across the face of the sun; and of this character, strictly speaking, is an annular eclipse of the sun by the moon. We have also transits of Jupiter's satellites across his disk.

The theory of eclipses was known to the Chinese at least 120 B.C. An eclipse was supposed by most of the Eastern nations to be the effect of magic; hence the custom among them of drumming during its continuance. The first eclipse recorded happened March 19, 721 B.C., according to Ptolemy; it was lunar, and was observed with accuracy at Babylon. The revolution of eclipses was first calculated by Calippus, the Athenian, 336 B.C. The Egyptians say they had accurately observed 373 eclipses of the sun, and 832 of the moon, up to the period from Vulcan to Alexander, who died 323 B.C.

Ecliptic (Gr. *ekleiptikos*, pertaining to an eclipse). So called because, that an eclipse of the moon may be possible, she must be in or near the path which the sun appears to describe annually in the heavens, round the earth as centre, from west to east, in consequence of the revolution of the earth in her orbit round the sun in the same direction.

The ecliptic is the natural equator of the heavens, and is the primitive circle in one of the systems of co-ordinates for defining points of the celestial sphere, and indicating their positions relatively to each other, the co-ordinates being longitude and latitude. The ecliptic is divided into twelve parts called "signs," each containing 30°, and receiving their names from constellations which were situated in them at the time the names were given. These divisions commence from the vernal equinoctial point, or first point of Aries.

Eddy. A current of air or water having a circular motion; the back-curl of the water under the stern. An eddy of wind may be caused by its striking against a bluff, sail, or other obstacle; an eddy in the water by a shoal, rock, point of land, etc.

Edge. *To edge away* or *to edge off* is to move off by slow degrees. *To edge down* is to approach an object by slow degrees, more particularly applicable to a sailing-vessel approaching an object in an oblique direction from to windward.

Eduction-pipe. See EXHAUST-PIPE.

Eduction-port. See EXHAUST-PORT.

Eel. A species of *Anguilla*, or of *Murœna*, etc., genera of soft-finned, snake-like fishes, belonging to the order *Apodes.*

The common eel of the eastern United States is the *Anguilla tenuirostris;* the conger-eel is the *Murœna conger.* The electrical eel of tropical South America belongs to the genus *Gymnotus.*

EEL-FARES. A brood of eels.

EEL-GRASS. The sea-wrack (*Zostera marina*).

EEL-POUT. A name for the burbot (*Molva lota*).

EEL-SKUYT. See DUTCH EEL-SKUYT.

EEL-SPEAR. A sort of trident for spearing eels.

Effects. Personal property.

Effluent. A stream which runs out of a lake, or another stream.

Eft. A saurian reptile, the *Lacerta seps* of Linnæus; a salamander, or newt, especially the common smooth newt.

Egg. *To egg on*, to provoke, to urge on,—from the Anglo-Saxon *eggion.*

Egmont Fowls. The large Antarctic gulls with dark-brown plumage; called also *shoemakers.*

Egyptian Herring. A name for the gowdanook, saury-pike, or *Scomberesox saurus.*

Eider-duck. The *Somateria mollissima*, a large duck of the northern seas; the down on the breast is valuable on account of its softness and lightness.

Eighen. The index of the early quadrant.

Ejectamenta Maris. Sea-products thrown on the beach. See JETSOM.

Eking. Making good any deficiency in the length of a piece of timber by scarfing or butting, as at the ends of hooks or knees. It is also a piece of carved work under the lower part of the quarter-gallery of a ship.

Elbing. A fortified seaport of West Prussia, 34 miles E.S.E. of Dantzic. It consists of an old town, a new town, and suburbs, and was until lately inclosed by walls, of which small portions remain. The manufactories of woolen cloths, refined sugar, vitriol, pearl-ash, tobacco, sail-cloth, etc., are very extensive. It has a very large trade. Pop. 36,000.

Elbow. A sudden change in the direction of a stream or channel. A promontory. See HAWSE.

Electrical Eel. A fish, or eel, of the genus *Gymnotus* (*G. electricus*), from 2 to 5 feet in length, capable of giving a violent electric shock.

Electricity. The theory most readily understood, and which most satisfactorily explains the various electrical phenomena, is as follows:

"That every substance and every atom of the world is pervaded by a peculiar, subtle, imponderable fluid which is termed *Electricity*, but which is not known to exist, or remains in a state of *electrical equilibrium*, until evoked by certain causes."

The effect of causing a disturbance of this equilibrium is to increase the normal, or natural, electricity in some particles, and to equally decrease it in other particles, *i.e.*, what one loses the other gains. An excess of natural electricity is denoted by the term *positive*, or mathematical symbol (+), while a deficiency is denoted by the term *negative*, or symbol (—).

Like electricities repel each other.

That is to say, two bodies charged with an excess of, or positive electricity, being brought together repel each other, neither wishing to increase the excess that has been evoked in them.

Similarly in the case of two bodies charged with a deficiency of, or negative, electricity, neither wish to add to the deficiency already there.

In both these cases there can be no tendency to electrical equilibrium, which is the principle at work. In the former case, there being already too much, more will but increase the disturbance.

In the latter case, further deficiency will but add to the irregularity.

Unlike electricities attract each other.

That is to say, if two bodies, one charged with positive, or having an excess of electricity, the other charged with negative, or having a deficiency of electricity, be brought together, they will attract each other; both being desirous of altering their existing state, the one by decreasing its excess, and the other by decreasing its deficiency of electricity.

In this case there will be a tendency to equilibrium, caused by attraction. The earth is supposed to be a vast reservoir of electricity, from which a quantity can be drawn to fill up a deficiency, and which is always ready to receive an excess from other bodies. Every body in nature has its own natural quantity of electricity, and when an object is negatively electrified, or has a deficiency in its normal quantity, there is a tendency to receive a supply from any convenient source. Such an object would receive electricity from the earth if means were afforded; and a body *positively* electrified would tend to part with its excess in the same manner. Where such facilities for establishing electrical equilibrium are afforded, the result is the passage of a *current* of electricity.

Conductors.—Sensible effects can be produced by electricity at great distances from the source, provided there be a medium of communication, that is, good *conductors* to transfer it. When a glass rod is rubbed with a piece of silk, it becomes charged with an excess of, or positive, electricity, and at the same time the silk becomes charged with negative electricity.

The glass rod will retain the positive electricity upon it for some time, unless touched with the wet hand, a wet cloth, a metal, etc., when it will instantly cease to be electrified. The electricity is then said to have been conducted away, and the bodies which allow it to run off the glass are called *conductors* of electricity. Metals, water, the human body, charcoal, damp wood, and many other bodies are conductors.

Those bodies which conduct electricity hardly at all, such as the air, silk, glass, sealing-wax, gutta-percha, india-rubber, etc., are termed *non-conductors* or *insulators*.

Strictly speaking, all substances *conduct* electricity in some degree, and a *non-conductor* is merely a *bad* conductor.

In the following table the bodies are arranged in their order of conductivity, *i.e.*, each substance conducts better than that which precedes it; the first-named body is the best insulator, and the last-named one is the best conductor.

Dry air.	Shellac.
Ebonite.	India-rubber.
Paraffin.	Gutta-percha.
Resin.	Saline solutions.
Sulphur.	Acids.
Sealing-wax.	Charcoal, or Coke.
Glass.	Mercury.
Silk.	Lead.
Wool.	Tin.
Dry paper.	Iron.
Porcelain.	Platinum.
Dry wood.	Zinc.
Stone.	Gold.
Pure water.	Copper.
Rarefied air.	Silver.
Sea-water.	

Though two substances are near one another in the above list, they do not necessarily approach one another in their power of conducting. For instance, taking the conducting power of pure silver as represented by the number 100, then

Pure Copper will be equal to 99.9,
Gold will be equal to 78.0,
while Zinc will be only equal to 29.0,

and pure water, which is half-way down the list, will offer 6754 millions more resistance than silver to the passage of the electric current.

The metals being the best-known conductors,

are usually employed as the means of transferring the electric current from one place to another.

Electric Circuit.—The conditions attending this operation are different from those of any other known method of transmission.

A complete *circuit* must always be formed by the electric current, *i.e.*, it cannot start from one place *A*, travel to another place *B*, and cease there, but the current must be completed before it can be said to have reached *B*. There cannot be a current of electricity without a means of recombination, which recombination must be at the *source*, or place of original disturbance.

This "place of disturbance" or *source* must be considered as having two sides, *i.e.*, at some spot the normal or natural electrical equilibrium is disturbed, and electricity is separated into too much (positive) on one side, and too little (negative) on the other side. If then no means of recombination be afforded, the electricities remain separated, and no current exists; but if a *conductor* be made to connect the two sides, electricity is set in motion, and a current established. Originally, to form a circuit between two stations *A* and *B*, a conducting wire and a return wire were necessary, but in 1837 Steinway discovered that the earth itself answered all the purposes of a return wire, in fact, under favorable conditions, much better. Thus, to form a circuit between *A* and *B*, a conducting-wire is required, and a buried metal plate at *A* and *B*, the earth by these means taking the place of the return wire.

The aforesaid metal plates are technically termed *earth-plates.* The greater the size of the earth-plates (up to certain limits), the deeper they are buried, and the better the conducting power of the soil surrounding them, the better conductors the plates become, or the less resistance the earth portion of the circuit offers. If either plate be not in communication with the earth, or else be separated from the wire, the circuit is not complete, or, as it is termed, "it is broken," and no current will flow, the signal not made, torpedo not fired, etc.

"*Short*" *Circuit.*—Due to the fact that recombination, or a tendency to equilibrium, is always at work when electricity has been evoked, the conducting path along which the electric current flows must be covered with a non-conducting substance, or, as it termed, "insulated," or else the current would not perform its duty, but escape to earth, and so form what is termed a "short" circuit.

A current of electricity always chooses the *easiest path* to effect recombination, or electrical equilibrium.

Insulators, etc.—On land, telegraph-wires are, as a rule, laid above the ground, and therefore require supporting at every few yards; this is done by means of posts, and as these are formed of substances which are conductors of electricity, the wires require to be insulated from them. The insulators generally employed for such purposes are cup-shaped pieces of porcelain, or pottery, fixed to the head of the telegraph-posts. By means of these insulators, the current of electricity is prevented from escaping to the earth by the post-conductors.

A certain amount of leakage, or loss of electricity, must occur at each of these posts, as there is no such thing as a perfect insulator. When the wires are laid on the ground or under ground, or under water, they are insulated by covering them with gutta-percha, india-rubber, etc., and any loss of current is thus prevented.

Methods of generating Electricity.—For the purposes of torpedo warfare there are two methods of evoking electricity, viz.:

1. By *chemical action.*
2. By *friction.*

By Chemical Action.—*Chemical action* is the chief source of free electricity, the representative of which is the galvanic, or Voltaic, battery.

The electricity so generated is also termed dynamical electricity, due to there being a constant electric current, so long as the poles of the battery producing it are kept closed; the electricity being thus in a *dynamic* or moving state.

By chemical action is signified that which occurs when two or more substances so act upon one another as to produce a third substance differing altogether from the original ones in its properties, or when one substance is brought under such conditions that it forms two or more bodies differing from the original ones in their properties.

Definition and Properties of a Voltaic Cell.—The *Voltaic* cell consists of an insulating jar, containing a liquid, in which are placed two plates or pieces of dissimilar metals; the liquid must be composed of two or more chemical elements, one of which at least tends to combine with one or other of the metals, or *with both in different degrees.*

By a Voltaic *battery* is meant a number of cells above one; this term, however, is often applied to a single cell when working by itself.

A "*simple* Voltaic cell," "element," or "couple," consists of two metals placed in a conducting liquid. If two metals—for instance, zinc and copper—are placed in water slightly acidulated, without touching each other, no effect is apparent; but if they be made to touch, bubbles of hydrogen gas are formed over the copper plate, and continue forming there until the plates are separated. After being in contact for some time, the copper plate will be found unaltered in weight, but the zinc plate will have lost weight, and the portion so lost will be found in the liquid in the form of sulphate of zinc. The same effects are also produced by connecting the two plates by means of some conducting substance instead of placing them in contact.

Zinc is invariably employed as one of the metal plates, on account of the ease with which it dissolves in dilute acids; and the greatest results are obtained when the second metal plate is not acted upon at all by the liquid, for then the whole effect due to the oxidation of the zinc plate is obtained; but when the second plate is also chemically acted upon, then only the effect due to the difference between the two chemical actions is obtained, for they each act in directly opposite directions.

Voltaic Current.—The Voltaic current makes its appearance under the general laws of electrical action.

When a body charged with an *excess* of, or *positive*, electricity, is connected with the earth, electricity is transferred *from* the charged body to the earth; and similarly when a body charged with a *deficiency* of, or *negative*, electricity, is

connected with the earth, electricity is transferred *from* the earth to the body.

Generally, whenever two conductors in different electrical conditions are put in contact, electricity will flow from one to the other. That which determines the direction of the transfer is the relative *potential* of the two conductors. Electricity always flows from a body at *higher potential* to one at *lower potential*, when the two are in contact, or connected by a conductor. When no transfer of electricity takes place under these conditions, the bodies are said to be at the *same potential*, which may be either *high* or *low*. The *potential* of the earth is assumed to be *zero*.

Definition of Potential.—"The *potential of a body or point, is the difference between the potential of the body or point, and the potential of the earth.*"

Difference of potential for electricity is analogous to difference of level for water. Now, since, when a metal is placed in a vessel containing a liquid, electricity is produced, the liquid becomes of a different potential to the metal, each being electrified in an opposite way; and therefore, as above stated, there being a *difference* of potentials, electricity will tend to flow from one to the other.

This is evidence of a *force* being in action, for there can be no motion without some force to produce it.

Electro-motive Force.—Electro-motive force is the name given to a peculiar force to which is due the property of producing a difference of potential. When it is said that zinc and water produce a definite electro-motive force, what is meant is, that by their contact a certain definite difference of potentials is produced.

The *electro-motive force* of a Voltaic element may be termed its *working* power, in the same way as the pressure of steam is the working power of a steam-engine, though this is not to be considered as the real source of power, which, as will be seen, is uncertain. Due to the difference of potential of the metal and the liquid, a current of electricity will flow from one to the other, causing the chemical decomposition of the liquid, and the reaction may be taken as the origin of the power employed.

But while the expenditure of energy (which is necessary to produce a *force*) is accounted for by taking the chemical action as the source of power, the preceding cause of this chemical action, viz., the flowing of the current of electricity due to the difference of potential of the metal and the liquid, must also have first involved the expenditure of energy; thus the real source of power is very uncertain.

Electrolytes.—As before stated, a Voltaic cell consists of two plates of dissimilar metals, which must be immersed in a liquid composed of two or more chemical elements, one of which at least will combine with one or other of the metals, or both in a different degree. Those liquids which are thus decomposed by the passage of a current of electricity are termed *electrolytes*.

The elements, then, forming the electrolyte may have chemical affinity for both metals, though in a greater degree for one than the other.

"Oxygen" is the most important element of an electrolyte, and to the *affinity for oxygen of the metals* is the magnitude of the result and effect.

Terms Electro-positive and Electro-negative.—All metals have a definite relation to each other as to the potential which any one may have when brought into contact with another. Thus, when zinc is brought into contact with copper, the former has a potential positive to the latter, *i.e.*, a current of electricity will tend to flow from the zinc to the copper. The metals may be so placed in a list that each one would be positive to any of those that follow it; it is then said to be electro-positive to them, and they are electro-negative to it. As those metals which are electro-positive to others have a greater affinity for oxygen, and those that are electro-negative to others a less affinity for this element, the terms electro-positive and electro-negative signify, in effect, greater or less affinity for this element. Conversely, oxygen will combine more readily with the former than with the latter.

The following list shows the commoner metals arranged in electro-chemical order:

+ Zinc.
Lead.
Tin.
Iron.
Antimony.
Copper.
Silver.
—Gold.

Take the case of a Voltaic cell composed of zinc and copper plates immersed in water.

The passage of electricity through the water will decompose it into its elements hydrogen and oxygen, the latter having an affinity for both the plates, but considerably more so for the zinc plate.

Then, an electro-motive force will be generated at each metal, and these forces will act in opposition to each other, but the greater strength of the one will overcome the weaker, and the real power of the electric current will be the difference between the two.

Definition of "Elements."—The battery-plates are termed the positive and negative *elements*. A Voltaic battery has two *poles*,—a positive and a negative,—which are the terminations of the plates.

Direction of Current.—The course of the current in a Voltaic cell is as follows: *Within* it leaves the electro-positive plate (or element), and flows to the electro-negative plate, but *outside* the cell (or as it were on its return path) it flows from the positive *pole* to the negative *pole*. The current always leaves the battery by the positive *pole*, and thus the copper is the negative *element*, but the positive *pole*, because the current leaves the battery by it; and the zinc is the positive *element* because the current begins there, *within* the cell, and the negative *pole* because it ends there, *outside*.

The positive pole is the terminal of the negative plate, and *vice versa*. There is but one current from a battery, viz., a positive one; what is called a negative current is merely the positive current passing in the reverse direction from the same pole, that is, the positive pole.

Single and Double Fluid Batteries.—Galvanic batteries may be divided into single fluid and double fluid batteries. The simplest form of

galvanic cell practically in use is a single fluid cell, consisting of a zinc and a copper element, immersed in water slightly acidulated by the addition of a little sulphuric acid. In a battery of several cells, the zinc and copper plates are generally soldered together in pairs, and placed in a long stoneware or glass trough divided into separate cells by means of partitions. By filling the cells with sand, this battery is made more portable, the plates being thus supported, and the liquid prevented from splashing about during transit.

In this form it is called the *common sand battery.*

Action in a Single Fluid Cell.—The following process goes on in the single fluid cell when the circuit is closed,—that is, when the battery is set to work.

The water (composed of hydrogen and oxygen) is decomposed by the passage of the electric current, and oxide of zinc is formed. The oxygen of the water having greater affinity for the zinc, leaves the hydrogen. The zinc during the process is being consumed, as coal is consumed when it burns, while combining with the oxygen of the air. This oxide of zinc combines with the sulphuric acid, and forms sulphate of zinc; this salt is found to accumulate in solution in the liquid of the cell. At the same time the hydrogen of the water goes to the negative or copper plate, and gathers over it in bubbles.

The process will be better seen by the accompanying plan of the chemical decomposition and recombinations.

Sulphuric acid.................................. } Sulphate of zinc found at positive plate.
Zinc........................ } Oxide of zinc. }
Water { Oxygen...... }
Water { Hydrogen..............................Hydrogen found at negative plate.

No *single fluid* cell can give a constant electromotive force, because of the *polarization* of the plates.

Definition of the term "Polarization."—The word *polarization* means that the plates become coated with the products of the decomposition of the *electrolyte*, producing a diminution of current. In the above-described battery, the hydrogen gathers on the surface of the copper plate, and an *electro-motive force* is set up which counteracts the electro-motive force producing the current,—the copper plate is said to be *polarized.* By the bubbles of hydrogen collecting on the face of the negative plate, the *surface* in contact with the liquid is gradually decreased; thus the plate becomes practically smaller, and a single fluid cell which at starting gave a good current soon shows that it is really weakened. The consequence is that the zinc is consumed extravagantly, as well as the acid, and the cell works with poor results. Also the *resistance* of the cell is increased, due to the sulphuric acid, which is added to the water to increase its conductivity, being gradually used up, by combining with the oxide (see plan) and forming sulphate of zinc. Liquids are very bad conductors of electricity; the greater part of the ordinary internal resistance of a battery arises from this cause. The common sand battery is the worst of all batteries as regards constancy of electro-motive force, the *polarization* being greater in this battery than any other, because the gas cannot readily escape. The common copper and zinc cell is the next in order of demerit. The *Smee* single fluid cell, in which the negative plate is a platinum instead of a copper one, is better than the copper zinc cell, because the free hydrogen does not stick to the rough surface of the platinum plate so much as to the copper.

Double Fluid Batteries.—All the defects of the single fluid battery, which are as follows:

1. Diminution of electro-motive force,
2. Inconstancy,
3. Increase of internal resistance,

are remedied in the *double fluid* battery, of which the *Daniell cell* was the first invented, and is a good example. Of this kind of cell many forms are in use, but the principle is the same throughout. There is a positive and negative element, and the cell is divided into two receptacles for the two fluids. In the most constant form of Daniell cell, the zinc is plunged into a semi-saturated solution of sulphate of zinc, the copper in a saturated solution of sulphate of copper, and these two solutions are separated either by a porous barrier, or by taking advantage of the different specific gravities of the two solutions. By a *saturated* solution is meant a liquid which has dissolved as much of the substance as it possibly can.

The Chemical Action of a Daniell Cell.—The chemical action of this form of Daniell cell is as follows:

The zinc electrode combines with oxygen; the oxide thus formed combines with sulphuric acid and forms sulphate of zinc. Oxide of copper is separated from the sulphate; and the copper in this oxide is separated from the oxygen. The oxygen of the water is separated at the zinc electrode from the hydrogen, and at the other electrode this hydrogen recombines with the oxygen from the oxide of copper. This alternate decomposition and recombination of the elements of water can neither increase nor decrease the E.M.F. of the cell, the actions being equal and opposite. The result of the series of actions above described is that the sulphuric acid and oxygen of the sulphate of zinc are transmitted to the zinc, combine with it, and form fresh sulphate of zinc; the sulphuric acid and oxygen of the sulphate of copper are transmitted to the zinc set free by the above process, and reconvert it into sulphate of zinc; the copper of the sulphate of copper is transmitted to the copper electrode, and remains adhering to it. The whole result is therefore the substitution of a certain quantity of sulphate of zinc for an equivalent quantity of sulphate of copper, together with a deposition of copper on the copper or negative electrode. The following is a plan of the process:

Zinc...................... } Oxide of zinc... } .... { Sulphate of zinc found at positive plate.
Water { Oxygen.... }
Water { Hydrogen.......................... .... } Water.
Sulphate of copper. { Sulphuric acid ....
Sulphate of copper. { Oxide of copper.. { Oxygen ..... }
Oxide of copper.. { Copper .... { Copper at negative plate.

The Circuit.—In connection with the manipulation of batteries, there is one important item to consider, viz., the *resistance* in the *circuit*, which may be divided into *external* and *internal.*

Resistances.—The *external* resistance in prac-

tice is that which exists in the conducting-line, and the various instruments connected with it.

The *internal* resistance is that which exists in the battery itself. All known conductors oppose a sensible *resistance* to the passage of an electric current, and the strength of the current, or in other words, the quantity of electricity passing per second from one point to another, when a constant difference of potentials is maintained between them, depends on the *resistance* of the wire or the conductor joining them. A bad conductor does not let the electricity pass so rapidly as a good conductor, that is, it offers more *resistance.*

Resistance in a wire of constant section and material is *directly* proportional to the *length*, and *inversely* proportional to the *area of the cross-section.*

The electrical resistance of a conductor must not be considered as analogous to mechanical resistance, such as the friction which water experiences in passing through a pipe, for this frictional resistance *is not* constant when different quantities of water are being forced through the pipe, whereas electrical resistance *is* constant whatever quantity of electricity be forced through the conductor.

Application of Ohm's Law.—Ohm's law, which governs the strength of the current, is expressed by the equation

$$C = \frac{E}{R} \text{ or } R = \frac{E}{C} \text{ or } E = CR.$$

Where C is the strength of the current;
E is the E.M.F., or difference of potentials;
and R is the resistance of the circuit.

In words, *Ohm's law* means that the strength of the current is *directly* proportional to the E.M.F., and *inversely* proportional to the resistance of the circuit.

As before stated, the resistance of the circuit consists of an *external* and an *internal* resistance, therefore when these resistances are separately considered, the equation $C = \frac{E}{R}$ must be converted into $C = \frac{E}{x + r}$, where x is the external, and r the internal, resistance.

The resistance of the battery or the *internal resistance* depends on the size of the plates and the distance between them; that is, it is *directly* proportional to the distance, and *inversely* proportional to the size.

The *electro-motive* force of a battery is dependent generally on the number of cells joined in *series*, and not on the *size* of the plates. The cells of a battery may be joined in two ways, as follows:

1. In series: that is, by connecting the negative element of one cell to the positive element of another, and so on.
2. In multiple arc: that is, by connecting negative to negative, and positive to positive; which is the same as increasing the size of the cells.

If the conductor between the battery poles be such that the *external* resistance x may be practically left out, then $C = \frac{E}{r}$, and no change in the strength of the current will be effected by adding any number of cells in series, as r will increase equally with E, and therefore C will remain the same; but if under the same conditions the cells be joined in *multiple arc*, then r will decrease as E increases, and therefore C will be increased.

Thus with a short circuit of small external resistance, the strength of the current will be increased by increasing the size of the plates, or by joining the cells in multiple arc, but not in series.

If the conductor between the poles of the battery be such that the external resistance x becomes very great, then $C = \frac{E}{x + r}$, where x is very great compared to r. By joining the cells in multiple arc r is decreased, but E and x remain the same, and therefore C is not materially altered, as x is very great compared to r. By connecting the cells in series, r is increased, and so is E, but as r is still very small compared to x, the strength of the current C is increased.

Thus with a long circuit of great *external* resistance, the strength of the current will be increased by joining the cells in series, but not in multiple arc.

When the external resistance x is neither very large nor very small in comparison with the battery or internal resistance r, then the strength of the current C will be increased by adding the cells in series, and also in multiple arc. By the former process the E.M.F. E is increased more than the resistance of the circuit R or $(x + r)$, and by the latter process the E.M.F. E is unaltered, whilst the circuit resistance $(x + r)$ is decreased. All the above may be practically demonstrated by the employment of suitable *galvanometers.*

Frictional Electricity.—Frictional electricity is produced by the friction of two insulators. There is *no difference whatever in kind* between "Voltaic" and "frictional" electricity.

Comparison with Voltaic Electricity.—The electricity generated by friction possesses a great electro-motive force, producing on even a small conductor a large charge, whereas the electricity generated by the galvanic cell possesses a very small electro-motive force, and produces only a small charge on a small conductor. But when the conductor is large, the electricity produced by the galvanic cell will almost instantaneously charge the conductor to the maximum potential it can produce, the galvanic cell developing an immense quantity of electricity by the chemical reaction; whereas the quantity developed by friction between two insulators is so small, that if it be diffused over a large conductor the potential of the conductor will be very little increased.

The late Professor Faraday has proved that one cell of a Voltaic pile possesses the same quantity of electricity as an ordinary-sized frictional machine after being wound round 800,000 times, thus showing the contrast between the qualities of frictional and Voltaic electricity.

The electricity of the frictional machine and that of the galvanic battery may be made to produce the same effect, there being no difference in kind between them. Frictional electricity can be made to pass in a current, but it is comparatively feeble. Again, Voltaic electricity can be made to produce a spark, but under ordinary circumstances it scarcely amounts to anything.

Description of a Frictional Electric Machine.—

A frictional electrical machine consists of a vulcanite or glass disk or cylinder, which is made to revolve between cushions or rubbers of leather or silk. By the friction the (silk) rubbers become negatively, and the glass disk or cylinder positively, electrified. The revolving disk immediately after contact with the fixed rubbers passes close by a series of brass points, which are connected with a *condenser*. These points collect the positive electricity of the glass, the rubbers being put to earth. The positive electricity which the glass loses is supplied through the rubber; a stream of negative electricity flows from the rubbers to the earth during the charging of the conductor or condenser; in other words, the positive electricity flows from the earth to the rubber, whence it crosses to the glass disk and so to the condenser.

Definition of a "Condenser."—A *condenser* is an arrangement for accumulating a large quantity of electricity on a comparatively small surface.

The "Leyden Jar."—The *Leyden jar*, which is the original type of the condenser, or accumulator, consists of a glass jar coated inside and out, up to within a few inches of the mouth, with tin-foil pasted on, but having no connection with each other. The mouth is usually closed by means of a wooden stopper, through which a brass rod passes, to the head of which is affixed a brass knob, etc., the rod and knob being metallically connected with the *inner* coating by means of a chain.

The "Leyden jar" may be charged either by connecting the *outer* coating to earth (the rubbers of the machine being also to earth), and the *inner* coating to the conductor of the machine; or else by connecting the outer coating to the rubbers, and the inner coating to the conductor, a complete circuit being necessary to charge the jar as highly as the frictional electrical machine will admit of.

The *conductor* of the machine being charged, also forms a kind of Leyden jar, the conductor in this case being the inner coating, the air, the *dielectric*, and the nearest surrounding conductors, such as the walls of the room, etc., being the outer coating.

Meaning of "Dielectric."—By *dielectric* is meant a non-conducting medium, which in the case of the "Leyden jar" is the glass.

Frictional Electricity very little used for Torpedo Purposes.—Frictional electricity is now seldom used in connection with torpedo warfare, as on account of its very great power, or electromotive force, a very perfectly insulated cable must be employed, which is somewhat difficult to obtain; it is also necessary to employ a condenser, which requires a certain time to charge. For these and other reasons, frictional electricity has been abandoned for the far more practical Voltaic electricity.

Magnetism.—A *magnet* is a piece of steel, which has the peculiar property, among others, of attracting iron to its ends.

Certain kinds of iron ore, termed the *loadstone*, have the same properties. The word "*magnet*" is taken from the country Magnesia, where the loadstone was first discovered.

Magnetism in a body is considered to be a peculiar condition caused by electrical action. Both electricity and magnetism have the power of communicating their properties to other bodies without being in contact with them, *i.e.*, *inducing* the power, which on the bodies being placed far apart becomes insensible.

The "Poles" of a Magnet.—Every magnet has two *poles*, called the *north* and *south* poles. A magnetic steel needle if pivoted on an upright point, or suspended from its centre, will fix itself, pointing north and south; in England the end of the needle pointing to the north is termed the north pole, but in France it is termed the south pole. The reason of this difference is owing to the fact that the north pole of one magnet attracts the south pole of another, and therefore, as the earth is considered as one vast magnet, the end of the magnetic needle attracted to the north pole of the earth should be the south pole of the magnet; thus the French south pole in a magnet is the English north pole, and *vice versa.*

Permanent Magnets.—A piece of steel when magnetized is termed a *permanent* magnet, because it retains its magnetism for a considerable length of time; but soft iron cannot be permanently magnetized.

A piece of soft iron rendered magnetic by induction retains a portion of its magnetism for some time after it has been removed from the magnetic field, by reason of what is called its *coercive force.* This remnant of magnetization is called *residual magnetism.*

Effect of an Electrical Current on a Magnetic Needle.—A magnetic bar or needle pivoted on its centre will point north and south, but if an electric current is caused to flow along a wire parallel to and either over or under the magnetic needle, the latter will be turned from its position, and remain so as long as the current continues; on the current ceasing the needle will resume its original position.

The magnetic needle can be turned either to the east or the west, according to the direction and course of the electrical current.

Thus:

Current from S. to N. *over* deflects to W.
Current from N. to S. *under* deflects to W.
Current from N. to S. *over* deflects to E.
Current from S. to N. *under* deflects to E.

The Galvanometer, the "Mirror," and "Thomson's Reflector" all depend on this principle for their usefulness.

The Electro-Magnet.—If a piece of insulated wire be coiled round a rod of soft iron, and a current of electricity be made to pass through the coil, the iron core becomes magnetic as long as the current passes; when the current ceases the magnetism disappears.

During the passage of the electric current, the iron core possesses all the properties of a magnet. Therefore if a piece of iron were placed near its poles it would be attracted and released from attraction as often as the current passed or ceased; and supposing such a piece of iron to be retained by a spring, etc., a series of movements, attraction, and drawing back would be effected.

A piece of iron so arranged is termed an *armature*, and the instrument is called an *electro-magnet.*

The coil of wire must be carefully insulated, or else the electric current will pass through the iron core to earth instead of performing its proper work.

* An electro-magnet is much more powerful than a steel magnet of equal dimensions, and depends on the strength of the current by which the magnetism is induced, and the number of turns of wire round the core. The north and south poles of an electro-magnet are determined by the direction in which the current flows through the wire.

At the *south* pole the current passes *with* the hands of a watch, and at the *north* pole *against* the hands of a watch.

Definition of the "Ohm."—The "ohm" is the standard used for electrical resistance; it is obtained by observing what effect is produced by a current of electricity on a certain conductor in a certain time.

The ohm is a small coil of German silver wire representing the resistance overcome by a current in a certain time. See TORPEDOES.

Electro-ballistics. In the earlier days of gunnery the accurate determination of the velocity of a projectile was a most perplexing problem, and taxed the ingenuity of some of the most scientific minds. The celebrated Benjamin Robins, about the middle of the 18th century, produced his ballistic pendulum, and both he and Count Rumford directed attention to the gun pendulum as a means for determining the initial velocity of projectiles. Each of these devices was extensively experimented with, by Hutton, in England, 1775–91; at Metz, 1839–40; and by Mordecai in this country, 1843–48.

In 1840, Professor Wheatstone first proposed the employment of electricity in determining the velocity of projectiles, and his suggestion was tested practically with satisfactory results. Subsequent researches by the late Professor Henry, of the Smithsonian Institution, led to improved modes of determining the most difficult problems in gunnery by means of electricity, and to him belongs the credit of having first proposed the use of the spark from what is now known as the Ruhmkorff coil, which has since been employed in the most successful instruments.

The mode of determining the velocity of projectiles by means of electricity may be stated, in general terms, as follows: Two wire screens, or targets, forming part of a galvanic circuit, are so placed as to intercept the flight of the projectile, which, as it passes through them, breaks the circuit. The instant of rupturing the target-wire is recorded by means of the electrical instrument employed, various ingenious designs of which exist, some of which are enumerated below. In this way the time occupied by the projectile in passing from the first to the second target is obtained; dividing the distance between the targets by this time, the velocity of the projectile at a point midway between the targets is found. In order to get the muzzle, or initial velocity, it is necessary to calculate the loss due to the resistance of the air over the space from the gun to the midway point between the targets.

The following are the electro-ballistic machines chiefly used by ordnance officers in this country:

Benton's West Point machine, which consists of a bed-plate of metal supporting an arc placed in a perpendicular position and graduated. Suspended perpendicular to the plane of this arc are two pendulums, having a common axis of motion passing through the centre. Two electro-magnets are attached to the horizontal limb of the arc to hold up the pendulums when they are deflected through angles of 90°. There is also an apparatus which records the point at which the pendulums pass each other, when they fall by the breaking of the currents which excite the magnets. The velocity of the electric currents being considered instantaneous, and the loss of the power of the magnets simultaneous with the rupture of the currents, it follows that each pendulum begins to move at the instant that the projectile cuts the wire, and that the interval of time corresponds to the difference of the arcs described by the pendulums up to the time of meeting.

The Navez-Leurs chronoscope, in which two similar pendulums—chronometer and register—having the same axis of suspension, their bobs supported at the extremities of a graduated arc of 180° by electro-magnets, are successively released upon the rupture, by the projectile, of the conducting-wires of their respective magnets. An index-needle oscillating by frictional attachment with the chronometer pendulum, automatically clamped at the instant of passing to the graduated arc, affords the means of determining the interval. Here may be mentioned the remarkable application by Col. Benton, in his velocimeter, of the principle "that the loosening effect of cutting a taut thread is transmitted to equal distances along the thread from the point of rupture in equal or sensibly equal times." This velocimeter, operated by a single person, who may also fire the gun, gives results sufficiently accurate for all the practical purposes of proving powder and making ballistic calculations.

Le Boulengé's chronograph, in which two weights supported by electro-magnets fall successively. The first, a long cylindrical rod (chronometer), falls at the rupture of the first wire; the second (registrar) falls, at the rupture of the second wire, upon a trigger, releasing a spring-cutter, which indents the chronometer-rod. From the difference of the spaces described the interval of time is computed.

The Schultz chronoscope, in which upon the lamp-smoked surface of a metal cylinder, having helical motion, a vibrating fork traces a time-scale. The rupture by a projectile of the primary wire of a Ruhmkorff coil, with an independent battery, induces in the secondary wire, one end of which is connected with the cylinder, the other carefully insulated, near it and just over the fork, a current; a spark projected to the surface of the cylinder leaves a bright spot at that point, indicating the instant of rupture. For the *Foucault* contact-breaker, has been substituted, at West Point, with apparent advantage, *Russell's* electric interrupter, in which a simple spring makes the fork its own interrupter.

The Bashforth chronograph, in which, with the aid of a clock, a time-scale is traced upon a cylinder, rotating about a vertical axis, by a marker at end of a lever actuated by an electro-magnet and an opposing spring attached to a plate, having a nearly uniform motion of translation in a vertical plane parallel to the axis of the cylinder. The helical path described by the

marker is interrupted at each second by a movement of the lever. A second lever and marker with electro-magnet and spring, also attached to the plate but connected with the screens, records the passage of the projectile. The markers being in close proximity the intervals are readily determined.

The Noble chronoscope, with which time records have been obtained for distances of 2.4 inches in the bore of a 10-inch gun, while the total time to reach the muzzle, a distance of 100 inches, when fired with a full charge, is about the one-hundredth part of a second. In this instrument metal disks, covered on the edge with white paper coated with lamp-black, rotating with high velocity, are connected with one end of the secondary wire of an induction coil, the other, carefully insulated, is brought to a discharger opposite the end of its corresponding disk, just clear of it. A spark perforates the paper at the instant of disruption of the primary wire, which, introduced by means of hollow steel plugs into holes bored through the walls of the gun, is severed by a cutter under pressure of the passing projectile. The angular velocity of the disks is determined by means of a stop-cock, which can be connected with the shaft. The linear velocity usually obtained is 1000 inches per second. By a vernier, reading to the one-thousandth part of an inch, intervals of time as minute as the one-millionth part of a second may be measured.

In the electric clepsydra, invented by Le Boulengé, the flow of mercury from a reservoir through a fine orifice, opened or closed by levers actuated by electro-magnets, upon the breaking of the electric current by the projectile, affords the means of determining the interval with great precision. See BALLISTIC PENDULUM, GUN PENDULUM.

Elephanter. A heavy periodical rain of Bombay.

Elephant-fish. The *Chimæra callorynchus*, so called because of a protuberance on its nose.

Elevate. In pointing a gun, *to elevate* was to raise the muzzle higher; the orders are now given in regard to the breech instead of the muzzle, so that the command *lower* corresponds to the old word *elevate*.

Elevated Pole. The pole which is above the horizon of the spectator.

Elevation, Angle of. See SIGHT, ANGLE OF.

Eligug. An aquatic bird of passage of the auk kind; called also *razor-bill*.

Elleck. A name for the *Trigla cuculus*.

Elliott, Jesse Duncan, Commodore U.S.N. Jesse D. Elliott was born in Maryland in 1782. He entered the navy as a midshipman in 1804. Served in several vessels, and was promoted to lieutenant in April, 1810. Was ordered to Commodore Chauncey's squadron on Lake Ontario in 1812. Having been sent to Lake Erie to gather ships, he captured the English brigs "Detroit" and "Caledonia" in a boat expedition. For this, the first naval success on the lakes, he was awarded a sword by Congress. Commanded the "Conquest" in Chauncey's squadron, and led in the brilliant attack on the enemy at Kingston, on the 8th of November. He next commanded the "Madison," 24, in the capture of York, Canada, April 19, 1813, and attack on Fort George, May 25. Was promoted to master commandant in July, 1813. In August he was transferred to Lake Erie, under Perry. Commanded the "Niagara," 20, and participated in the victory on that lake, September 10, 1813. For bravery in that action he received a gold medal. Received the command from Perry on the 25th of October. Commanded the "Ontario," 22, in Decatur's squadron to Tunis and Algiers, sailing May 20, 1815, and returning the same year. Promoted to captain, March 27, 1818. From 1817–24 was a commissioner to select sites for light-houses, and fortifications for North Carolina. Commanded Brazil Squadron, 1825–28; West India Squadron, 1829–32; Charlestown Navy-Yard, 1832–35; and Mediterranean Squadron, in the "Constitution," 1835–38. From 1839–40 was waiting orders, and under suspension from 1841–43 for various irregularities in his conduct. Waiting orders, 1844; navy-yard, Philadelphia, 1845; and died there, December 10, 1845, aged 63. Was energetic, brave, and reliable, but fitful in temper.—*F. S. Bassett, Lieutenant U.S.N.*

Elliott-eye. An eye worked over a thimble in the end of a cable or hawser.

Ellipse (Gr. *elleipsis*, a falling short of). A curve such that the sum of the distances to any point from two given points, called the *foci*, is constant. The orbits of the planets are ellipses, as are the terrestrial meridians. See CONIC SECTIONS.

Ellison, Francis B., Commodore U.S.N. Born in New York. Appointed from New York, May 28, 1819.

Commissioned as lieutenant, May 17, 1828; schooner "Porpoise," Mediterranean Squadron, 1827–29; receiving-ship, New York, 1833–34; navy-yard, 1837; frigate "Brandywine," 1840; store-ship "Lexington," Mediterranean Squadron, 1845; navy-yard, New York, 1847–48.

Commissioned as commander, May 29, 1850; inspector, etc., New York, 1853–54; commanding sloop "Jamestown," coast of Africa, 1855.

Commissioned as captain, March 2, 1857.

Commissioned as commodore, July 16, 1862; light-house inspector, 1866–68. Retired October 1, 1864.

Ellsworth, a city and port of entry, capital of Hancock Co., Me., is on the Union River, a few miles from the ocean, and 28 miles S.E. of Bangor. The prosperity of this place is mainly derived from the lumber business, navigation, and ship-building. Pop. 5500.

Elmo's Fire, St. See ST. ELMO'S FIRE.

Elops. A fish inhabiting the seas of America and the West Indies; the *Elops saurus*, or saury.

Elver. A young conger- or sea-eel.

Embargo. A prohibitory order, issued by the government of a state to prevent the sailing of foreign (or, in certain exigencies, home) shipping from its ports. A willful breach of embargo discharges the underwriters from liability.

Embark. To go on board, or to put on board a vessel.

EMBARKATION. The shipping of goods, troops, and stores.

Embarment. An old term, meaning an embargo.

Ember-goose. A name for the great northern diver or loon (*Colymbus glacialis*).

Embezzlement. The fraudulent appropria-

tion to one's own use of money or property intrusted to one's care or management.

In the merchant service mariners are bound to contribute out of their wages for embezzlements of the cargo. If the embezzlement be fixed on any individual, he alone is responsible. If it has arisen from the fault, fraud, connivance, or negligence of any particular portion of the crew, they are bound to contribute to the reparation of the loss in proportion to their wages; and when the circumstances of the case create a strong presumption of guilt against the whole crew, all must contribute. Where no reasonable presumption against their innocence is shown, the loss must be borne exclusively by the owner or master.

Embouchure. A French word adopted as signifying the mouth of a river, by which its waters are discharged, or by which it is entered.

Emden, or Embden. A fortified seaport town of Prussia, near the Dollart, 14 miles S.W. of Aurich. The town is intersected by canals connected with the harbor, and is a railway terminus. Principal edifices, the council and custom-houses, barracks, school of navigation, etc. The port is shallow, but the roadstead is deep enough for vessels of any size. Large ship-building docks are located here. Pop. 13,000.

Emeralders. A term for the natives of Ireland, from its evergreen verdure.

Emergencies at Sea. Emergencies at sea are those sudden and unforeseen occurrences which require the promptest action to avert disaster. The most common of these are an alarm of fire, collision with another vessel, running suddenly into very shoal water, or getting ashore, springing a leak, being struck by a squall while under sail, and losing a man overboard. Whenever a sudden demand is made upon a ship's company for putting forth their utmost energy and skill, much depends upon the example of the officers, and much on the normal state of discipline. If the officers have the skill and experience which only come with devotion to one's profession, and, retaining their self-possession, they issue their orders with decision, their example communicates itself to the crew, and order, even in the face of appalling danger, prevails. If the crew have been faithfully exercised at the various manœuvres likely to claim their attention, there is a ready and intelligent effort on the part of all to secure their common safety; or, in the last extremity, a steadfast purpose to meet their fate like men.

Inexperienced officers, and such as have made their profession a secondary consideration, and an undisciplined crew, are apt to be thrown into confusion at the very first alarm; panic ensues, and the danger is enhanced by misguided men seeking their personal safety, or misapplying their efforts.

An alarm of fire at sea is enough to appal the stoutest heart. To meet this emergency every ship has a regular fire-bill, in which each officer and man has his appropriate station and duty. The first step is to assemble the crew at quarters, where they are divided up into small groups of gun's crews under their proper officers. This prevents panic at once, and renders the crew more manageable. Every available pump is put in requisition; the hose are led out; a wrecking-party is supplied with axes, etc., and a smothering-party with wet blankets. Means are employed to prevent unnecessary currents of air; the ship's course is changed with reference to the wind, that the latter may be the least favorable for spreading the fire; the magazines are furnished with flood-cocks, by which they may be filled with water; sentries are posted over the boats to prevent their being lowered without orders. These means, particularly the use of the powerful steam-pumps of our modern ships, have been found adequate, while preserving the utmost order, to control any ordinary fire. The best preventive against panic is to be found in constantly drilling the crew at their stations, and from time to time by sounding false alarms when the crew are least prepared.

Should the fire gain the mastery, the boats are resorted to, a raft constructed of spare spars, provisions distributed, and the ship at the last moment abandoned. It is then that officers find their reward in the previous care bestowed upon the boats and their equipments. It is customary now to have a regular station-bill for "abandoning ship," and the crew exercised by it. The total loss by fire of the United States steam-frigate "Missouri," in the Bay of Gibraltar, in 1843, is a memorable example in point.

Collisions.—These generally occur in a fog, during the night, or in a crowded harbor. The Rules of the Road, as recently revised (which see), are sufficient to enable ships to avoid each other on all ordinary occasions. But there are times when it would seem as if no human care were sufficient to prevent collision.

The lights of one ship may be burning brightly, and yet, from some unsuspected cause, may be screened to the look-out of another vessel. This has no doubt led to many collisions at night. No rules will supply the want of careful attention to the running lights, the keeping of a good look-out, and the exercise of good judgment in the management of the ship. The running down and sinking of the United States steamer "Oneida," Commander E. P. Williams, United States navy, by the British mail steamer "Bombay," Capt. Eyre, January 23, 1870, by which 120 lives were lost, furnishes a melancholy illustration of this class of emergencies.

Getting on shore, or grounding, may sometimes happen even with the utmost care. The vessel may have been carried out of her course by unknown currents; continued fogs may have prevented observations of the sun; or, she may be brought up suddenly by some rock or shoal not laid down on the charts. Than this there are few emergencies at sea which make greater demands upon the skill, resources, energies, and endurance of both officers and crew. Sails must be instantly laid aback, or the engines reversed. Should this means fail, anchors must be sent out astern, a good strain be brought upon the cables, and the ship lightened, and hove off.

It is related that an English 64-gun ship having parted her cables in a gale, was drifting helplessly on shore, when the captain ordered the flood-cocks to be opened and the ship filled as much as possible with water. By this means the ship's draft was increased one foot before she took the bottom. On the return of good weather the water was pumped out, and the ship hove off.

Springing a leak, happily of rare occurrence

to a man-of-war, calls for prompt and intelligent action. In 1859 the Russian line-of-battle ship "Cæsarevitch," while cruising in the Mediterranean, sprung a leak. Cables and hawsers were passed round and round her, and hove taut to bind her together. She finally put into Malta for repairs, leaking so fast that her crew were well-nigh exhausted by their efforts to keep her afloat.

Eighteen hundred years before that, St. Paul, while at sea in a corn-ship of Alexandria, was caught in an equinoctial gale (A.D. September 23, 60), when the mariners were obliged to "undergird the ship," and subsequently to run her on shore on the same island,—Malta.

Struck by a squall while under sail calls for good seamanship on the part of the officer in charge of the deck. By putting the helm up the long ship of the present day is apt to go off far enough to bring the wind abeam, and stick there. This is a most dangerous position, and one to be avoided. The better plan is to keep a sharp look-out, and get the ship before the wind and under short canvas before the squall reaches you. If this is not practicable, then take your chances of luffing through it, reducing sail as speedily as possible. No written directions can possibly supply the place of good seamanship acquired in the school of practice. Even in this school close observation and reflection are essential. The one supplies mental pabulum; the other furnishes the digestive process by which the intellectual food is assimilated and converted into the very bone and fibre of the system.

Man overboard! Few alarms so startle "the little warlike world within" as this. Sympathy and curiosity impel every one to rush at once to the scene, and the direst confusion ensues. By making out a regular station-bill for a "man overboard," and by frequent false alarms, in which a buoy should be dropped and the life-boat lowered, the chances of panic, as with false alarms of fire, are reduced to a minimum.

In a steamer, the life-buoy must be dropped as near to the man overboard as possible, the engines stopped, the life-boat lowered, and the man picked up.

Sailing on a wind, a ship should be hove about, lowering the boat, and leaving the mainyard square, in stays. Going large with the yards well squared in, the ship should be rounded to, with head-yards aback, sail being reduced as expeditiously as possible.

The following points should be considered:

First, the quickest and most effectual means of checking the ship's way and keeping her as near the man as possible.

Secondly, to preserve order, enforce prompt obedience, and discourage fool-hardy volunteering.

Thirdly, to see that the life-boat is in all respects ready for use, and her crew at hand.

Fourthly, that the boat be not lowered with stern-board on.

Fifthly, to have persons stationed to keep the man in sight, and by motions to direct the course of the life-boat; at night to display a good light.

Finally, to insure success the officer in charge of the deck must be, in every sense, master of the situation.

Sailing in squadron, there is no alternative but to go about at once, and at night to display the position lights, to prevent your second astern from piling upon you. In the daytime there should be a preconcerted signal, by which the commander-in-chief, and the rest of the squadron, may know what has happened.

In the French signal-book there is a special rule laid down for this emergency.

In very bad weather, the question may present itself as to how far it would be justifiable to risk the lives of the seven or nine men of a boat's crew for the doubtful chances of saving one. In this conflict between feeling and discretion one's own judgment must decide.

The loss of, or injury to, a rudder is an emergency of rare occurrence in these days. On taking the ground, however, a ship may thump her rudder off; or, through defective workmanship or decayed wood, it may be lost in a gale, or it may be shot away in action.

The readiest and simplest substitute for a rudder is a hemp cable, or hawser, paid out over the stern, after the manner of a drag. To this are bent, well out from the ship, guys, of smaller hawsers, which are led in through blocks on either quarter. Heavy luffs are clapped on to the guys, and the ship steered by bringing the strain on either guy as may be required. Having made this temporary provision, a jury-rudder may be constructed on the plan proposed some years ago by Capt. Pakenham of the English navy. This consisted of a spare topmast, to form the rudder-stock, and other spare spars secured to it, and trimmed off in such lengths as to present, when boarded over, the general appearance of a rudder. A spare lower-cap serves as a gudgeon; the round hole embracing the topmast; the square one being cut away so as to be adjusted to the stern-post, where it is held in place by guys taken well forward and hard taut.

An order issued by the English Admiralty in 1840 required that ships should be furnished with a spare rudder-stock fitted with pintles. To the stern-post were fitted, while the ship was in dock, spare gudgeons. With these arrangements a jury-rudder could readily be constructed. In the event of wrenching off the rudder-head immediate resort would be had to the rudder-chains, which are kept for the purpose.

In regard to emergencies in general, the habit cannot be too often, or too earnestly recommended to officers placed in positions of responsibility, whether at sea or in port, of constantly presenting to themselves the various cases which might arise demanding their prompt and vigorous action.

By this method they school themselves for the hour of trial, and pass through any ordeal they may be subjected to with the glory of success.—*S. B. Luce, Captain U.S.N.*

Emersion. The reappearance of an occulted body.

Emmons, George F., Rear-Admiral U.S.N. Native of Vermont, from which State he was appointed midshipman, April 1, 1828; at Naval School, Brooklyn, N. Y., 1828; thence to steam-frigate "Fulton," in which he remained until she blew up, June 4, 1829; then in frigate "Brandywine," on special service to West Indies, 1830; and in Mediterranean, 1830–33.

Promoted to passed midshipman, July 14, 1834; brig "Consort," on our coast, 1836; bark "Pioneer," West Indies, 1837, carrying out Gen. Santa Anna, after his defeat in Texas; in

frigate "Macedonian" (as master) on our coast, 1837; joined the sloop-of-war "Peacock," and was commissioned as "lieutenant during the exploring expedition" of Capt. Wilkes, serving in her from 1838 to July, 1841, when she was lost on the bar at the mouth of Columbia River, Oregon.

Regularly commissioned as lieutenant, February 25, 1841; was occasionally in command of schooner "Flying-Fish," and while engaged in surveying and boat expeditions among the Pacific islands, was frequently engaged with the natives.

After the loss of the "Peacock," had charge of a party consisting of the scientific corps, officers, sailors, marines, and some hunters and trappers, to explore the country south of the Columbia to the head-waters of the Sacramento, and thence through California to San Francisco, where the party arrived, after several skirmishes with hostile natives, but without loss; in November, 1841, joined the "Vincennes," flag-ship of the Exploring Expedition, and came home in her *via* the East Indies, in 1842; receiving-ship and recruiting duty in Baltimore in 1843; in sloop-of-war "Boston" and frigate "Raritan," Brazil Squadron, in 1843–46; during the Mexican war, in the "Ohio"; 1847–48, in Gulf of Mexico, Brazil, and Pacific; was frequently employed on shore in Upper and Lower California, and once sent to the Sierra Nevada as bearer of dispatches to Gen. Mason; in sloop "Warren" and "Southampton," Pacific, in 1849; on bureau duty, Navy Department, Washington, 1851–52; in frigate "Savannah," Brazil Squadron, 1854–56; during the last year was in command of her as the flag-ship of Commodore Mercer.

Commissioned as commander, January 28, 1856; bureau duty and member of Light-House Board in 1861; during the Rebellion, was generally employed on blockade duty in the Gulf of Mexico and on the Mississippi River in command of the steamers "Hatteras," "R. R. Cuyler," "Monongahela," and "Brooklyn"; while in command of the first named captured Cedar Keys and Pass Christian, and some twenty prizes, nearly all of which were under English colors.

Commissioned as captain, February 7, 1863; was fleet-captain under Admiral Dahlgren, off Charleston, in 1863, while Fort Sumter was being reduced; afterward commanded the steam-sloop "Lackawanna" and a division of blockading vessels (from five to fifteen) in the Gulf of Mexico, to the close of the war; while commanding afloat at New Orleans, assisted in destroying the rebel ram "Webb" and capturing her officers and crew; upon two occasions successfully repelled and thwarted the attempts of the enemy to burn the shipping and city by fire-rafts and boats laden with hay and combustibles, whereby millions of property were saved; commanded the steam-sloop "Ossipee" to the Pacific and Alaska, in 1866–68, carrying thither our Commissioners and hoisting the American flag over our new possessions. During the return trip to San Francisco, the ship came near being lost in a hurricane which she encountered off Sitka.

Commissioned as commodore, September 20, 1868; appointed senior member of Ordnance Board in Washington, 1869, and subsequently given charge of the Hydrographic Office; commanding Naval Station, Philadelphia, 1870–72.

Commissioned as rear-admiral, November 5, 1872. Total sea service, 23 years; shore or other duty, 11 years. Retired August 23, 1873.

Emprise. An attempt or undertaking of danger; enterprise.

Emptions. Stores purchased.

Encircling Reef. A name given to a form of coral reef.

End for End. To shift an object *end for end* is to turn it through an angle of 180°. To shift a fall *end for end* is to reeve it the opposite way, so that the hauling part becomes the standing part.

End-on. Bow foremost; the opposite of *broadside-on.*

Enemy. In the military and naval sense, the opposing force.

Energy. The energy or *vis viva* of a shot is the amount of work stored up in it, and is expressed by the formula $\frac{w\, v^2}{32.16 \times 4880}$ = foot-tons of energy, w representing weight of shot, and v the velocity of impact.

The above formula classes projectiles in regard to their mashing or racking effect, but to find the punching effect the energy must be divided by the number of inches of the shot's circumference.

Enfield Rifle. A rifled musket which took its name from Enfield, in England, the place of its manufacture. It was, in the days of muzzle-loading small-arms, a serviceable and valuable weapon, but has now been superseded by arms of the breech-loading system.

Engagement. A battle or general action.

Engine. A machine for applying any of the mechanical powers or principles; especially a machine for applying steam to propel vessels, railroad trains, etc. See Marine Steam-engine.

Engine-bearer, or Engine-keelson. Strong timbers or girders, built in the bottom of a ship, on which the engines rest, and to which they are secured.

Engineer. One who plans structures or machines and superintends their construction, or surveys land or water for the location of structures. The term is applicable to those skilled in designing military or naval works, or machines of offense and defense, or in surveying and planning aqueducts, canals, railways, docks, etc.

One who is skilled in engineering, or the management of engines.

Engine-room. The space allotted to steam-engines and their appurtenances in ships or buildings.

Engine-room Telegraph. An electrical or mechanical device for communicating signals from the deck of a vessel to the engine-room. These signals may appear either in words, by sound of a gong, or by a combination of both.

Engineer, Civil. There are 10 civil engineers on the active list, one being stationed at each navy-yard and naval station.

The civil engineer supervises the erection and the repairs of all buildings, docks, and wharves in the navy-yards, and, if required to do so, of magazines, or other naval structures outside the yards. He has the immediate supervision and direction of the architect, when one is employed at the same yard with himself, and of all fore-

men and other workmen employed on said works, and recommends their respective wages, and is responsible for the proper distribution and employment of all materials for said work. He prepares plans of any proposed improvements, and estimates of cost, with bills of materials and schedules for advertisements, which may be necessary for such works. He supervises the inspection and measurement of all materials under his charge, and he is responsible for the waste or improper use of all material by those under his general supervision.

Engineer Corps. Though *engineer* is not a modern title in the military establishment, it is new to the navy.

The first officer of this name was placed on the official list of the British navy January, 1837, and the first appointment of an engineer in the navy of the United States was in 1836; but the corps was not regularly organized and incorporated in the navy register until 1843.

November 7, 1837, the Secretary of the Navy wrote Capt. M. C. Perry that the "Fulton" was allowed, as recommended by the Commissioners of the Navy and approved by the Navy Department,—

2 first-class engineers at $800 per annum each.

2 second-class engineers at $500 per annum each.

4 coal-heavers at $15 per month each.

8 firemen at $25 to $30 per month each.

This was the germ of the engineer corps of the U. S. navy, which at present consists of an active list of—

1 engineer-in-chief, having the relative rank of commodore.

9 chief engineers, having the relative rank of captain.

15 chief engineers, having the relative rank of commander.

45 chief engineers, having the relative rank of lieutenant-commander.

90 passed assistant engineers, having the relative rank of lieutenant.

6 passed assistant engineers, having the relative rank of master.

42 assistant engineers, having the relative rank of ensign.

54 cadet engineers, having the relative rank of cadet midshipman.

On the retired list there are 7 chief engineers, 18 passed assistant engineers, and 23 assistant engineers.

This increase, from 4 officers in 1837 to over 300 in 1880, shows the rapid development of steam as an adjunct in naval warfare. See Staff-officers.

Engineering, Bureau of Steam. This bureau directs the designing, running, and repairing of engines, boilers, and appurtenances afloat and at navy-yards and naval stations. The chief of the bureau is the engineer-in-chief and has the relative rank of commodore. See Navy Department.

Engineer-in-chief. See Engineering, Bureau of Steam.

Engineer, Fleet-. The senior chief engineer on a station is detailed to discharge the duties of engineer of the fleet. He is attached to the flagship, and his duties are as follows:

1. To exercise a general supervision over all the engineers of the fleet or squadron.

2. To acquaint himself with the different kinds of engines in use in the squadron, and to recommend the means to keep them in the highest state of efficiency.

3. To make quarterly inspections of machinery, and to decide upon all ordinary repairs. If alterations or additions to the machinery are proposed, a special report must be made, stating their probable cost and the time necessary for their execution.

4. To recommend surveys when imperfections or accidents are serious, and to make report where carelessness is known or suspected.

5. To see that every vessel is provided with the necessary tools, stores, and spare parts of machinery, and that every engine and boiler is properly cared for. As the strictest economy is required in the expenditure of stores, he will, previous to any of the vessels in the squadron leaving on detached service, see that they are provided with all that may be required in the engineer department, to prevent, as far as possible, any purchases while absent from the commander-in-chief, and he will make a report of the same to the commander-in-chief.

6. To examine the coal used, and report if there is any falling off in quality, or any undue dampness, and to see that it is properly stored at the depots, and that there is at all times a sufficient quantity on hand to meet the probable wants of the squadron.

7. To make frequent reports of the condition of the engineer department of every vessel in the squadron.

8. To examine all returns and requisitions made by the senior engineers of vessels, and to forward them, with such remarks as he may deem necessary.

9. To recommend such measures as will, in his opinion, promote efficiency, economy, and uniformity in his department.

10. And, finally, to perform such other duties, relating to his position, as shall be assigned him by the commander-in-chief.

Engineer, Chief. There are 70 chief engineers; the senior 10 have the relative rank of captain, the 15 next in seniority have the relative rank of commander, and the junior 45 have the relative rank of lieutenant-commander. See Engineer-in-chief.

When a chief engineer is attached to a navy-yard, he, under the direction of the commandant, has the superintendence of the construction and repair of the steam and other machinery. He has the supervision, under the commandant, of the foremen and all the men employed in the machine- and boiler-shops and foundries, and of the material used in those departments, and is responsible for its preservation and proper use. He has charge of all steam-machinery afloat, at the yard or station, under the direction of the commandant, whether the vessel be under repairs or in ordinary; and he is to exercise control over all employés in the engineer's department on board such vessels. When the vessel under repair is in commission, he will, before commencing any repair, confer with the commanding officer of the vessel, who will render him every facility for the prompt and economical execution of the work. He is responsible for the condition and preservation of all the machinery of the vessels under his charge. When a steamer

is to be laid up, he will take charge of the machinery at the time the chief engineer of the vessel is detached; when repairs are to be effected, he makes requisition on the commandant for the work necessary.

When a chief engineer is attached to a vessel he is in charge of the boilers and engines and their dependencies, distilling apparatus, steam-winches, engines for turning steam-capstans, etc. He keeps a strict account of the expenditures of coal, stores, and other articles in his department, and frequently examines the coal in the bunkers to see that there is no danger of spontaneous combustion.

Engineer, Assistant. When there is no chief engineer on board, the duties assigned to him devolve on the senior assistant engineer. Assistant engineers are at all times faithfully and zealously to carry into prompt execution all orders they may receive; and they are to be specially careful in the management of the engines, boilers, and their dependencies. When the engines are in operation, the engineer of the watch must execute promptly all orders he may receive from the officer of the deck, though he must be careful in so doing that no risk of injury is incurred. He reports hourly to the officer of the deck whether the engines and their dependencies, the force-pumps, hose, and all other means for extinguishing fire, are in good order, and that the pumps and hose are ready for immediate use. He notes hourly on the steam-log all the information which the columns in it require, and places in the column of "remarks" full information of the state of the weather and sea, and all accidents to, or defects in, the engines or their dependencies, the manner of their working, the quality of the coal, and any other circumstances which may be useful for determining the powers and qualities of the vessel and the engines under the various circumstances to which they may be exposed. He must be particularly careful to prevent the waste of coals, oil, tallow, and all other stores in the engineer's department.

Passed assistant engineers rank as lieutenant or master according to length of service; assistant engineers as master or ensign.

English, Earl, Commodore U.S.N. Born in New Jersey. Appointed from New Jersey, February 25, 1840; attached to frigate "Constellation," East India Squadron, 1840–44; steamship "Princeton," special service, 1844–45; Naval School, 1846.

Promoted to passed midshipman, July 11, 1846; razee "Independence," flag-ship, Pacific Squadron, 1846–48; present at capture of Mazatlan, 1847; steamer "Vixen," Home Squadron, 1849–50; store-ship "Southampton," Pacific Squadron, 1851–53; receiving-ship, Philadelphia, 1853; coast survey, 1854–55.

Promoted to master, 1855.

Commissioned as lieutenant, September 14, 1855; sloop "Levant," East India Squadron, 1855–58; took part in engagements with Barrier Forts, Canton River, China, November, 1856; navy-yard, Philadelphia, 1859; steam-sloop "Wyoming," Pacific Squadron, 1860–61; commanding steamer "Somerset," East Gulf Blockading Squadron, 1862; capture of fort at mouth of St. Mark's River, Florida, June 15, 1862.

Commissioned as lieutenant-commander, July 16, 1862; commanding steam-gunboat "Sagamore," East Gulf Blockading Squadron, 1863; captured and destroyed town of New Smyrna, Fla., July 28, 1863; commanding steam-gunboat "Pontiac," 1864; commanding steamer "Wyalusing," North Atlantic Blockading Squadron, 1864–65; capture of Plymouth, N. C., October, 1864; in action with rebel batteries and infantry, on Roanoke River, near Poplar Point, N. C., during the expedition up that river, the advance being prevented by torpedoes, December, 1864; ordnance duty, navy-yard, New York, 1866.

Commissioned as commander, July 25, 1866; commanding steam-sloop "Iroquois," Asiatic Squadron, 1867–69; commanding flag-ship "Delaware," Asiatic Fleet, 1870.

Commissioned captain, September 28, 1871; special duty, 1872; navy-yard, Portsmouth, N. H., 1873; commanding "Congress" (second-rate), European Station, 1873–76; navy-yard, Portsmouth, N. H., 1876–78.

In 1878 appointed chief of Bureau of Equipment and Recruiting.

Commissioned as commodore, 1880.

Enlarge. The wind is said to enlarge when it comes out nearer the stern.

Enlist. To enter upon a list; to enroll. Thus, the recruiting officer is said to enlist a man.

To enter into a contract with the government to serve it for a term of years in a naval or military capacity. Men are enlisted in the navy for a term of 3 years, and in the marine corps for 5 years. See Enlistment.

Enlistment. The act by which a man binds himself to serve the government for a term of years in a military or naval capacity. Recruiting officers are enjoined to guard against the enlistment of improper, unsound, or incompetent persons. Boys between the ages of 16 and 17 may be enlisted to serve in the navy until they reach the age of 21, but only with the consent of their parents or guardians given in a prescribed form. No person under 16, no insane or intoxicated person, and no deserter from the naval or military service shall be enlisted. No person shall be entered as landsman over the age of 25, unless he has some mechanical trade; nor after 34, even though he has a trade, without the authority of the Department. No person shall be entered as ordinary seaman unless he shall have been two years at sea; nor as seaman, unless he shall have been four years at sea before the mast, and have passed a satisfactory examination. The recruit is required to declare on oath, in presence of the commanding officer of the rendezvous or vessel, that he makes a true statement of his age, to the best of his knowledge and belief. Persons enlisted for general service shall not be detailed as servants for officers. Attendants selected by the officers themselves are enlisted for the cruise, and are not to be turned over to the general service. After selection these men must be retained as attendants until discharged.

Ensign. The lowest grade of commissioned officers in the navy, corresponding to the grade of second lieutenant in the army. An ensign is a steerage officer, and may be ordered to duty on the forecastle, in the fire-room, or to any other duty at the discretion of the commanding officer. When assigned permanently to duty as a watch- and division-officer he is entitled to quarters in the wardroom. This title was first introduced

into the U. S. navy in 1862, taking the place of the title of Passed Midshipman, and these officers now continue the duties of the latter.

Ensign. The national flag. (See COLORS.) It is almost invariably hoisted at the peak of American vessels, but English men-of-war generally hoist their ensign to a staff at the stern when in port. See FLAG.

Entering-ladder. See ACCOMMODATION LADDER, JACOB'S LADDER.

Entering-port. In three-deckers, a port cut down to the level of the deck on the middle deck.

Entering-rope. A man-rope over the side at the gangway.

Entrance. The angle which the bow of a ship makes with the water at the line of flotation.

Entrance-money, or Entrance-fee. A payment made for mess-furniture, stores, etc., on joining a mess.

Epact (Gr. *epagein*, to add in). The number indicating the days and parts of a day to be added to the lunar year of 12 lunar months to make it up to the solar year; this number is the age of the moon at the commencement of the calendar year. A mean lunation is $29^d\ 12^h\ 44^m$; the moon, therefore, describes in 365 days 12 complete lunations and $10^d\ 15^h$ of the thirteenth; hence on the first of January its age is $10^d\ 15^h$ more than on the preceding first of January, and $11^d\ 15^h$ if the preceding year was a leap-year.

The *epact for the year* is the moon's age on the first of January; the *epact for the month* is the moon's age on the first of the month, supposing the moon to change at noon January 1st.

Epaulet. A shoulder ornament. See UNIFORM.

Ephemeris, The Astronomical. Works on astronomical bibliography mention *ephemerides* as early as the 12th century. The earliest printed ephemerides are those of Johann Regiomontanus, published in the latter part of the 15th century. They included only the predictions of eclipses and positions of the planets, and sold for much more than their weight in gold. The earliest astronomical ephemeris appearing year by year is the *Connaissance des Temps ou des Mouvements Celestes*, which has not suffered interruption since the publication of the first volume, by Picard, for the year 1679. Since 1795, the work has been under the direction of the *Bureau des Longitudes*, established in that year. It is issued two years in advance of date. Each volume contains a very full *Table des Positions Géographiques*, data not conveniently accessible elsewhere. Detailed improvements were introduced into the volumes for the years 1862 and 1863, whereby the *Connaissance des Temps* was placed on equal footing with the ephemerides of other nations. One marked difference between it and similar publications consists in the omission of the Calendar, proper,—the several ephemerides being arranged according to the objects to which they pertain, and not according to the months of the year. The first volume of the astronomical ephemeris of England may be said to be that for the year 1834. The British Nautical Almanac, however, had then long been a regular publication,—the first volume was that for the year 1767 (see ALMANAC, THE NAUTICAL); but the ephemerides for the special use of the astronomer had always occupied a secondary position. In addition to the important change from apparent to mean time in the computations of the Almanac, the Report of the Committee Relative to the Improvement of the Nautical Almanac recommended, among other things, an extension of the ephemeris of Jupiter's satellites, the insertion of a list of moon-culminating stars, apparent places of fixed stars for upper transit at Greenwich (instead of, as previously, for noon), and the insertion of a table for determination of latitude by Polaris at any time. Almost no important differences of arrangement are to be remarked between the British Nautical Almanac for 1834 and that for 1883,—the latest issued. An unparalleled circumstance in the history of nautical almanacs occurs in the British Nautical Almanac for 1882, wherein the positions of the sun and the major planets are all predicted from one uniform series of tables,—those by the late Le Verrier, of Paris. The *Berliner Astronomisches Jahrbuch* (Berlin Astronomical Annual) is among the oldest of the national ephemerides; the first volume was that for the year 1776. It is published two years in advance of date, and is marked by a lack of design for the use of navigators; being gotten up almost solely with reference to astronomical convenience. One characteristic feature consists in the great amount of space devoted to ephemerides of minor planets, which now number about 220 (June, 1880). Spain publishes one year in advance its *Almanaque Náutico*, computed for the meridian of San Fernando. It does not need especial notice, except that nearly all the data of prediction are embraced under the Calendar scheme, thus making it the counterpart of the *Connaissance des Temps*. The Portuguese publish, two years in advance, the *Ephemerides Astronomicas*, computed for the meridian of Coimbra. It is very similar to the *Almanaque Náutico* of the Spanish, both in general arrangement and amount of data, except that it gives no apparent positions of fixed stars. The Italian *Effemeridi Astronomiche di Milano* ranks among the oldest astronomical ephemerides, the initial volume being that for the year 1755. The data of prediction which it contains are mostly for the use of astronomers, only. A good share of the space in many of the volumes is given up to astronomical memoirs and meteorological observations. In treating of the American ephemeris, we shall have to do principally with that portion which is designed quite exclusively for astronomical use, and is adapted to the meridian of Washington. No radical changes ever having been made in the general principles of its construction, we shall take the volume for 1883, now in press, for a descriptive specimen. In addition to the ephemerides of the sun and moon, the lunar distances and ephemerides of the most conspicuous planets, contained in the navigator's portion of the volume, the American Ephemeris and Nautical Almanac contains the heliocentric positions of the major planets, with the logarithms of their distances from the sun and from the earth; the rectangular equatorial co-ordinates of the sun; the longitude and latitude of the moon; data for the libration of the moon; the aberration and parallax of the sun; formulæ and numbers for reducing a star from its mean to its apparent place or the reverse; special ephemerides for easy reduction

of observations of the moon and major planets; very full data, with maps, of the eclipses; data for the prediction of occultations of planets and stars by the moon; phenomena and configurations of the satellites of Jupiter, and data for identifying all known satellites of the other planets; the longitude and latitude of about 140 observatories; an article on the arrangement and use of the American Ephemeris and Nautical Almanac; an appendix on the construction of the same; and a selection of tables much used in astronomy and navigation. The astronomical tables by which the American Ephemeris and Nautical Almanac is prepared are as follows: the ephemerides of the sun and moon are from Hansen's Tables; Mercury, from Winlock's Tables; Venus, from Hill's Tables; Mars, from Lindenau's Tables, with corrections; Jupiter, from Bouvard's Tables, with corrections; Jupiter's satellites, from Damoiseau's Tables, supplemented by those of Todd; Saturn, from Bouvard's Tables, with corrections; Uranus and Neptune, from Newcomb's Tables.—*D. P. Todd.*

Epoch. A point of time rendered conspicuous by some historical event; era; period; date.

Eprouvette. A small piece of ordnance for testing the force of gunpowder.

Equal Altitudes. See ALTITUDE.

Equation of Equal Altitudes. See ALTITUDE.

Equation of Second Differences. See DIFFERENCES, SECOND.

Equation of Time. The difference between apparent and mean time. In consequence of the motion of the sun in the ecliptic being variable, and the ecliptic not being perpendicular to the axis of the earth's rotation, apparent time is variable, and this fluctuation is considerable, amounting to upwards of half an hour,—apparent noon sometimes taking place as much as $16\frac{1}{4}^{m}$ before mean noon, and at others as much as $14\frac{1}{2}^{m}$ after. These are the greatest values of the equation of time; it vanishes altogether four times in the year,—this occurring about April 15, June 15, September 1, and December 24. It is calculated and inserted in the Nautical Almanac for every day in the year. The equation of time is itself a portion of mean time.

Equator (Lat. *æquare*, to divide into equal parts). The *terrestrial equator* is that great circle of the earth whose plane is perpendicular to the axis of the earth, and consequently every point of which is equidistant from the north and south poles. It divides the globe into the northern and southern hemispheres. The equator is the primitive circle in the system of co-ordinates used for defining the position of places on the earth's surface. Origin, intersection of the equator by the first meridian; co-ordinates, longitude and latitude.

The *celestial equator* is the great circle in which, if the terrestrial equator were extended indefinitely, it would intersect the celestial sphere. It is also called the *equinoctial*, and is the primitive circle in a system of co-ordinates used for defining the position of points on the celestial sphere. Origin, first point of Aries; co-ordinates, right ascension and declination.

EQUATORIAL CURRENT. The set, chiefly westerly, met with near the equator, especially in the Atlantic.

EQUATORIAL PROJECTION OF A SPHERE. A projection in which the primitive plane or plane of projection is parallel to, or coincides with, the equator.

EQUATORIAL SECTOR. An instrument for finding the difference in the right ascension and declination of two heavenly bodies.

EQUATORIAL TELESCOPE. A telescope so mounted that it enables the observer to follow the stars as they move equatorially.

Equiangular Spiral. A line which cuts the meridians at a constant angle; a rhumb-line; a loxodromic curve.

Equilibrium-valve. A valve for equalizing the pressure of a fluid or fluids contained in two separate chambers or vessels. The term, though objectionable, is sometimes applied to the main steam- and exhaust-valves of an engine when they are "balanced," or so arranged that difference in pressure between the boiler steam and discharged steam will not offer resistance to the movement of the valve. "Double poppet-valves," "D-valves," and "ring" or "piston-balanced" plain slide-valves are examples.

Equinoxes (Lat. *æquus*, equal; *nox*, night). The two periods of the year, about the 21st of March and the 23d of September, when the sun, in his annual revolution in the ecliptic, crosses the equinoctial. At these times the days and nights are of equal length throughout the world, hence the term. The two equinoxes are distinguished as the *vernal equinox* and *autumnal equinox;* the former being that when the sun passes from the southern to the northern hemisphere, the season being "spring" in the northern hemisphere; the latter, when the sun passes from the northern to the southern hemisphere, the season being "autumn" in the northern hemisphere. These terms are relative; for what are the vernal and autumnal equinoxes for the northern are respectively the autumnal and vernal equinoxes for the southern hemisphere. In cases where there is any danger of ambiguity or confusion, we may add the qualifying adjectives "northern" or "southern," as the case may be; thus, one date would be called the *northern vernal equinox* or the *southern autumnal equinox*, and the other the *northern autumnal equinox* or the *southern vernal equinox*. It is convenient to restrict the term *equinox* to indicate a *date* or epoch of *time;* and to use the expression, *equinoctial point*, when we want to refer to a *position* or *place* in the ecliptic. Similarly for *solstice* and *solstitial point*.

EQUINOCTIAL. The celestial equator. The name is derived from the fact that at all places on the surface of the earth beneath this circle the nights are equal all the year round, being of the constant length of 12 hours. The equinoctial is the primitive circle in a system of co-ordinates for defining points on the celestial sphere. Origin, first point of Aries; co-ordinates, right ascension and declination.

EQUINOCTIAL COLURE. The hour-circle which passes through the equinoctial points. In the polar co-ordinates for the celestial sphere, it is the initial position of the secondary circles. See COLURES.

EQUINOCTIAL GALES. Storms which occur about the time the sun crosses the equinoctial.

EQUINOCTIAL POINTS. The two points of the ecliptic in which it is intersected by the equinoctial. They are distinguished as the *vernal equi-*

noctial point and the *autumnal equinoctial point*, but are more generally called the *first point of Aries* and the *first point of Libra*, as being the commencement respectively of these signs of the ecliptic, and they are represented by their symbols ♈ and ♎. The constellations of Aries and Libra, though not now coincident in position with them, give their names to these divisions of the ecliptic, and the figure of the *Balance* (Libra) has evident reference to the equipoise of the day and night at the equinox. The first point of Aries is the origin or zero point, from which right ascensions are reckoned on the equinoctial and longitudes on the ecliptic. The equinoctial points do not, however, preserve a constant place among the stars, but travel backwards along the ecliptic,—*i.e.*, from east to west, or contrary to that in which the sun appears to move in that circle. This retrogression is extremely small, amounting to 50.1″ annually, so that a complete revolution occupies 25,868 years. It is, however, of great inconvenience to practical astronomers, as it renders obsolete, from time to time, their catalogues of the stars, which are referred to this shifting vernal equinoctial point as origin. Since the formation of the earliest catalogues on record, the place of the first point of Aries has retrograded about 30°, altering to this extent the longitudes. The technical phrase for the phenomenon is the *precession of the equinoxes*,—a term derived from the fact that the epoch of the equinox every year "precedes," or is earlier than it would have been but for the retrogression of the first point of Aries.

Equip. To supply with all the articles necessary for efficient service. To fit out.

Equipment. The act of fitting out or furnishing an individual, vessel, or force with all the essential requirements for efficient action. Also, the collective designation of the articles comprising the outfit.

Equipment and Recruiting, Bureau of, is that branch of the Navy Department which has charge of the equipment of all vessels of war, the supply of their sails, rigging, anchors, and fuel; also the recruiting of sailors of the various grades for the navy. See Navy Department.

Equipment Officer. The captain of the yard is the head of the department of equipment in the yard, and discharges the duties of that position in addition to his other duties. The executive-officer is the equipment officer of a ship, and is responsible for all articles and stores in that department.

Equuleus. See Constellation.

Erichthus. A genus of long-tailed decapod crustaceans, inhabiting tropical seas.

Ericsson, John, LL.D. Born in the province of Vermeland, Sweden, 1803. At the age of 11, Count Platin gave him a cadetship in a corps of engineers; and in 1816 he was employed on the grand ship canal between the Baltic and the North Sea. He entered the Swedish army as ensign, rose to the grade of lieutenant, and was for some time employed in the survey of Northern Sweden. One of the earliest of his inventions was the flame-engine, intended to work independently of steam by condensing flame. Visiting England in 1826, he discovered that this engine when worked by mineral fuel was a total failure. Devoting himself to mechanical pursuits, he invented the steam-boiler on the principle of artificial draft. In 1829 he competed for the prize offered by the Liverpool and Manchester Railway for the best locomotive, and produced an engine that attained the then incredible speed of fifty miles an hour. This led him to construct a steam fire-engine with entire success. Directing his attention to navigation, he invented the propeller, and that new arrangement of the steam-machinery in ships of war which has revolutionized the navies of the world. Not succeeding in making the British Admiralty believe what they saw, he came in 1839 to New York, and in 1841 was employed in the construction of the U. S. ship of war "Princeton," on the very plan which had been received with such indifference by the British Admiralty. She was the first steamship ever built with the propelling machinery under the water-line, and out of the reach of shot; and she was distinguished for numerous other mechanical novelties. In 1852 he was made Knight of the order of Vasa by King Oscar of Sweden. The same year he brought out a new form of caloric-engine in the ship "Ericsson." In the American department of the great exhibition of 1851 he exhibited an instrument for measuring distances at sea, the hydrostatic gauge for measuring the volume of fluids under pressure, the reciprocating fluid-meter, the alarm barometer, the pyrometer, the rotary fluid-meter, and the sea-lead, of all of which instruments he has given a brief explanation in a pamphlet published in 1851. For these he received the prize medal of the exhibition. Ericsson's caloric-engine was first placed before the scientific in London in 1833. Its advantages over steam are economy of space, economy of first cost, economy of fuel, of repairs, and running expenses, simplicity, safety, and power. His great invention—the ironclad "Monitor"—had just been completed, and arrived at Fortress Monroe most opportunely, March 9, 1862, to stay the devastating progress of the rebel ironclad "Merrimac." The result of this contest settled the question of "wooden navies." Capt. Ericsson was the first to bring the system of iron turret-ships into operation.

Eridanus (the river *Eridanus*, the Po). A winding constellation in the southern hemisphere, containing one star of the first magnitude. *α Eridani*, called also *Achernar*, may be found by bisecting the line joining Fomalhaut and Canopus.

Erie. A city and port of entry, on Lake Erie, 88 miles S.W. of Buffalo, 95 miles E.N.E. of Cleveland. Lat. 42° 8′ N.; lon. 80° 8′ W. It has a safe land-locked harbor, which is 4 miles long by 1 mile wide, and is protected by the island of Presque Isle, on which two light-houses are situated. Pop. 27,000.

Erigone. A name sometimes applied to the constellation Virgo.

Erne. See Earne.

Escape-valve. A weighted or constrained valve, so arranged as to permit the escape of a fluid from a chamber when the pressure exceeds a desired tension. See Safety-valve and Cylinder Escape-valve.

Escutcheon. The space on the stern of a ship where her name is painted.

Eskippamentum. An archaism for a ship's furniture (Anglo-Norman, *eskipper*, to ship).

Eskippeson. An old law-term for a passage by sea. See ESKIPPAMENTUM.

Esnecca. A royal yacht of the 12th century. A transport of the middle ages.

Esox. A genus of abdominal fishes, including the pike.

Espials. An old term for night-watches afloat, in docks and harbors.

Esquimalt. A seaport of British Columbia, on Vancouver Island, on the Strait of Juan de Fuca, 65 miles from its entrance, and 3 miles S.W. of Victoria. The harbor is very extensive, and vessels of the largest size can anchor here in safety. Esquimalt is destined apparently, in connection with the Canada Pacific Railway, to be the future entrepôt of a national commerce. Here are situated a navy-yard, a hospital, and other necessary buildings for the requirements of a squadron, as the town is the station of her Majesty's ships of a portion of the Pacific squadron.

Esquimaux. A name derived from *esquimantsic*, in the Abenaki language, meaning *eaters of raw flesh.* Many tribes in the Arctic regions are ignorant of the art of cookery.

Establishments, Naval, of Great Britain. The dock-yards of Great Britain are situated at Chatham, Sheerness, Portsmouth, Devonport, and Pembroke. There are victualing-yards at Deptford, Gosport, and Haulbowline, near Cork, Ireland. In her colonies, Great Britain has fine dock-yards at Bermuda, Malta, and Halifax, besides store-ships or store-houses at most of the principal ports.

Chatham is situated on the Medway River, 30 miles E.S.E. from London. In addition to having the School of Military Engineering and the Marine Infirmary, it possesses a fine dock-yard, which is a mile in length, containing several ship-building slips and dry-docks sufficiently capacious for the largest ships. It has also basins for the vessels of the Steam Reserve, which is a term applied to the vessels forming the list in ordinary. It has a metal-mill, which supplies the other dock-yards with copper sheets, copper bolts, and other articles in copper and mixed metals. It has also extensive saw-mills, the largest rope-walk in the kingdom, and all scrap-iron is sent to Chatham to be melted and rolled into required shapes. It has also a machine for testing the strength of chain-cables, and block-making machines. The dock-yard has a rear-admiral-superintendent in command, and employs 2000 hands.

Sheerness is situated on the northwest extremity of the Isle of Sheppey, at the confluence of the Thames and Medway, 11 miles E.N.E. of Chatham. It has a fine dock-yard covering over 60 acres, has immense store-houses, several dry-docks and basins. It is under the control of a captain-superintendent, and with Chatham comes under the command of the commander-in-chief at the Nore.

Portsmouth is the chief naval arsenal of Great Britain, and is situated on the southwest side of Portsea Island, at the entrance of Portsmouth harbor, and opposite the town of Gosport. It is 74 miles S.W. from London. The dock-yard has an area of 300 acres; it has basins capable of holding all the vessels of the British navy; has also a dozen dry-docks, and a large deep sea-dock over 600 feet long and 60 feet in depth. It has also a torpedo-ship for the instruction of officers in torpedo warfare, and a gunnery-ship for instruction in gunnery. The dock-yard also contains mast- and rope-houses, hemp-stores, rigging-stores, and sail-loft. It has various ship-building slips. The wood-mills contain a number of block-making machines. The harbor is 420 yards wide at its entrance, and is defended by forts on each side. It expands into a spacious basin, extending inland for 4 miles, forming Porchester Lake. Large war-vessels can enter and lie at anchor at all times of the tide, and in the stream above the dock-yard are moored several hulks of vessels which bear names that they have rendered historical. The "Victory," Lord Nelson's flag-ship at the battle of Trafalgar, is kept here in commission, and is open to the general public. The dock-yard is under the control of a rear-admiral-superintendent, and the naval station, comprising Spithead and Gosport as well, is under the general command of the naval commander-in-chief. The importance of this port dates from the reign of Henry VIII.

Haslar Hospital, near Gosport, is one of the largest naval hospitals in Great Britain.

Devonport is two miles W.N.W. of Plymouth, and contains a large dock-yard of 358 acres in extent. The yard is situated on the Hamoaze, an estuary of the Tamar. It contains six building-slips for vessels and five dry-docks. It is the principal yard for sail-making, rope-making, and the manufacture of anchors. It employs about 2500 hands; is controlled by a rear-admiral-superintendent, and the station at Plymouth is under command of a naval commander-in-chief.

Pembroke, situated in South Wales, on a navigable creek of Milford Haven, is 7 miles S.E. of Milford. Pembroke dock is 2 miles from the town. It has twelve building-slips and dry-docks. The entire naval establishment covers an area of over 80 acres. It is principally a ship-building yard, and owes its naval importance to that fact.

The British government does not confine its ship-building entirely to the dock-yards, but employs, when required, the services of private ship-builders.

Deptford, which is now a victualing-yard, is situated in the town of that name, about 4 miles below London bridge, and opposite Greenwich. It has five building-slips and two dry-docks, but they are not much used now, as it is principally a fitting-out yard. It is the chief station for victualing the foreign and home stations, also for the small stores and clothing for the navy and marines, which are here inspected, packed, and issued to the naval service.

At Gosport, opposite Portsmouth, is the Royal Clarence Victualing-Yard, where the bread used in the British navy is made. It has extensive bakeries, etc.

At Haulbowline, near Cork, is also a victualing-yard, similar to, but not so extensive as, Deptford.

At Dartmouth, Devon, on the south coast of England, is the training-ship "Britannia" for the naval cadets.

At Chatham, Portsmouth, and Devonport are extensive barracks for the marines when not on service afloat.

Establishment of the Port. See TIDE.

Estuary. An inlet of the sea; the widening of the mouth of a river into an arm of the sea.

Esture. An old word for the rise and fall of water.

Etesian Winds. The *Etesiæ* of the ancients; winds which blow constantly, in the Levant, during the time of the dog-days.

Etiquette, Naval. Naval ceremonies; customs of the service.

Euphroe. A block of wood to extend the small lines called a *crow-foot.*

Evaporation. Vapor is any substance in a gaseous condition, at the maximum density consistent with that condition. It is certain that most substances are volatile, and do exist in a state of vapor at all attainable temperatures. Iron, copper, lead, and tin are examples in which this is obvious to the smell.

When a body passes from a solid or liquid to a gaseous state, the *work* necessary to separate the atoms requires a certain quantity of *heat* for each unit of weight of the substance evaporated, which is dependent on the temperature of the *boiling-point,* and remains constant for any constant pressure of the vapor produced without being sensible to the thermometer. This is called the *latent heat of evaporation.* The *total heat of evaporation* is the sum of the *latent heat,* and the heat required to raise the temperature before evaporation from some fixed temperature to that of evaporation. When a vapor is condensed an action reverse to that of evaporation takes place.

Regnault's experiments, the most extensive and accurate known, show that the latent heat of evaporation of pure water at the atmospheric pressure of 14.7 pounds per square inch is 966.1° F. The *boiling-point* is 212° F., and the *total heat* from the temperature of melting ice, 1146.1° F.

Eve-eel. A name for the conger-eel,—from the Danish *hav-aal,* or sea-eel.

Evening Gun. The gun fired at tattoo.

Even Keel. A ship so trimmed as to draw the same water forward as she does aft is on an *even keel.*

Evolution. A manœuvre of a fleet, vessel, or body of men.

Ewage. An old law-term for the toll paid for a water-passage.

Examinations. Boards are ordered for the examination of candidates for appointment or promotion, the latter being duly informed of the time and place of meeting. Before proceeding to the examination of any candidate for appointment, the medical officers furnish to the board a certificate of the physical fitness of the candidate. No person will be passed by the medical board who is not free from physical defects and all obvious tendency to any form of disease which would be likely to interfere with an efficient discharge of duty. In the case of an assistant surgeon, the board scrutinizes his physical qualifications, and makes a separate report in each case direct to the Department. The board to examine professionally, having received the certificate of the physical fitness of the candidate, examines him on all the required qualifications; it grants certificates to those who may be found duly qualified, numbering them in the order of merit; it also reports to the authority convening the board, at the close of a session, the result of all its investigations, and forwards the documentary evidence it may have received in relation to the capacity and fitness of those examined.

Applications for admission into the navy can be made to the Secretary of the Navy at any time by the candidate himself, or by his parent, guardian, or friends. All applications must state age, birthplace, and residence of the candidate, who must also furnish certificates of moral and physical qualifications. No person will be appointed an officer in the navy until he shall have passed a physical and a professional examination.

Any person giving a false certificate of age, character, or time of service, or making a false statement to a board of examination, will be dropped.

A candidate for an appointment to the grade of assistant engineer must be not less than 19 nor more than 26 years of age; [illegible]ave had not less than two years' service in [illegible] and fabricating and management of steam-[illegible]nd by for marine purposes, and must give sa[illegible]en to evidence of his skill in such capacity, or [illegible]hem served not less than that period as an engin[illegible]nd on board of a steamer provided with a conde[illegible]b-sing-engine, and have a certificate from the director or superintending engineer as to [illegible] ability.

He will be examined in accordance with the forms prescribed by the Navy Department.

A candidate for the office of assistant naval constructor must be not less than 24 nor more than 30 years of age; must furnish evidence showing that he is a shipwright by profession, that he has been engaged in that business, and must present the certificate of the person with whom the business was learned, and will be required to pass such examination as the Navy Department may direct.

A candidate for the office of assistant paymaster must be not less than 21 nor more than 26 years of age. His moral and mental qualifications will be subjects of rigid investigation by a board.

A candidate for the office of assistant surgeon must be not less than 21 nor more than 26 years of age. His moral, mental, and professional qualifications will be decided upon by a board.

An applicant for the office of chaplain must be not less than 21 nor more than 30 years of age. He must be a regularly-ordained minister.

A candidate for a boatswain's appointment must be of correct habits, not less than 21 nor more than 35 years of age; he must have been at least seven years at sea, and have served at least one year as a petty officer; he must be a thorough practical seaman, and understand cutting, fitting, and rigging according to regulations, the weighing, catting, fishing, securing, and transportation of anchors and the working of cables, the erection and securing of sheers, the handling of purchases, masting, securing yards, etc., and be able to write sufficiently to keep an account of stores.

A candidate for the appointment of acting gunner must be a seaman of sober and correct habits, not less than 21 nor more than 30 years of age. He must understand the manner of fitting magazines and shell-rooms; the manner of stowing and preserving powder, projectiles, fireworks, and all ordnance-stores afloat and on shore; also the manner of handling and secur-

ing guns. He must be able to put up all kinds of ammunition, to take impressions of vent and bore, to star-gauge guns, to adjust, verify, and use sights, and to fit all gun-gear. He must understand and be able to explain all fuzes in use in the navy, and be conversant with orders and regulations in regard to the care and handling of all ordnance material, afloat or ashore, and with the charges of powder for guns and projectiles of every calibre. He must be able to read and write with facility, understand the first four rules of arithmetic and proportion; be able to keep the gunner's accounts correctly, and he must have made a cruise in a sea-going vessel of war.

A candidate for a carpenter's appointment must be of correct habits; be not less than 21 nor more than 30 years of age; be a good ship-squadr, understand calking, the fishing of masts jesty'yards, and the quality and strength of tim-Es how to unship and hang a rudder, to con-manuct and hang a jury-rudder, and be able to eatrite sufficiently well to keep an account of regores.

A candidate for a sailmaker's appointment must be of correct habits; be not less than 21 nor more than 30 years of age; be a good workman; be capable of draughting, and understand thoroughly the cutting and making of sails, awnings, hammock-cloths, boom-covers, and wind-sails, and be able to write sufficiently well to keep an account of stores.

No acting gunner will receive a warrant as gunner until, after making a cruise of not less than one year as acting gunner in a sea-going vessel, and after a course of laboratory instruction at the Washington Navy-Yard, he has passed a thorough examination before a board of line-officers. He will not be entitled to examination unless he presents commendatory letters from his commanding officers. An acting boatswain, carpenter, or sailmaker is eligible for a warrant bearing the same date as his acting appointment after serving one year at sea: provided the commanding officers under whom he has served have certified favorably as to his merits.

Boards for the examination of candidates for appointment or promotion are composed as follows: for a mate, boatswain, gunner, carpenter, or sailmaker, of three line-officers, one of whom shall be of or above the rank of lieutenant-commander; for engineer officers, of three chief engineers; for passed assistant and assistant paymasters, of three paymasters; for assistant naval constructors, of three naval constructors. See NAVAL ACADEMIES, RECRUITING.

Examination of Officers for Promotion and Retirement in the Navy, Board of. Officers of the medical corps were first subject by statutory law to examination before promotion to a higher grade by a board of surgeons, designated for the purpose by the Secretary of the Navy. The act requiring the examination of this class of officers was approved May 24, 1824.

The subsequent legislation of Congress on this subject, as expressed in the acts approved respectively July 16, 1862, and April 21, 1864, require "all officers below the grade of commodore, and all officers not of the line," and "in time of peace all officers to be promoted from the list of commodores to the grade of rear-admiral," to be examined as to their physical qualifications to perform the duties of a naval officer at sea by a board of medical officers, appointed for the purpose by the Secretary of the Navy. An exception is made in cases of officers whose physical disqualifications were occasioned by wounds received in the line of duty, which do not incapacitate them for other duties in the grade to which they shall be promoted.

In addition to the physical examination herein stated, the officers aforesaid are required to establish their mental, moral, and professional fitness for promotion to the satisfaction of a board of examining officers appointed by the President of the United States. Said board to consist of not less than three officers, senior in rank to the officer to be examined.

The officers thus subject to examination before promotion, to a grade limited in number by law, are not entitled to examination in such a sense as to give increase of pay, until designated by the Secretary of the Navy to fill vacancies in the higher grade.

When such vacancies occur, and the officers are designated to fill the same, the law says that "any such officer whose case is to be acted upon by such examining board shall have the right to be present if he so desires, and to submit a statement of his case on oath."

The peculiar wording of this section of the law has occasioned different opinions as to its meaning. Some officers have questioned the right of such examining board to personally interrogate officers who appear before it as candidates for promotion, and have claimed that the law leaves it optional with the candidates to be present or absent, as they may elect.

Upon full examination of the law, and after mature deliberation as to its interpretation, it has been decided by the revising authority that such right exists, and that the law creating such examining boards, and such candidates for examination, implies without question the right on the part of the former to interrogate, and the duty on the part of the latter to answer.

The right of personal examination is therefore the fundamental principle of these boards, and indispensable primarily to the accomplishment of their objects, and this power may not be restrained or limited except by express affirmative legislation.

In addition to this right of personal examination, the law confers upon these boards all needful and convenient power of further collateral examination, such as to summon, swear, and examine witnesses, and to inspect the files of the Navy Department; and those powers are exercised in such forms of procedure and report as will enable the President of the United States, who is the revising authority, to see and understand fully all the facts necessary or desirable for his consideration.

The boards are organized anew in each case, and sworn in the presence and hearing of the candidate to be examined.

The record of the proceedings in each case is made up with precision and care, and with scrupulous attention to legal requisites, and is signed by every member and the recorder, and shows who of the members concurred in, and who, if any, dissented from the opinion of the board.

The requisite mental, moral, and professional qualifications, to be determined by the examina-

tions, relate to the duties and responsibilities of the grade to which the candidate seeks promotion, and not to those of any other grade.

No officer may be rejected until after such public examination of himself, and the records of the Department in his case, unless he shall fail to appear before the board after having been duly notified.

Whenever any officer of the navy, on being ordered to perform the duties appropriate to his commission, shall report himself unable to comply with such order, or whenever, in the judgment of the President of the United States, an officer of the navy is in any way incapacitated from performing the duties of his office, the President, at his discretion, directs the Secretary of the Navy to refer the case of such officer to a board of not less than five commissioned officers, two-fifths of whom are members of the medical corps of the navy; the members of the board, except those taken from the medical corps, are senior in rank to the officer to be examined.

The board is authorized to inquire into, and determine the facts, touching the nature and occasion of the disability of any such officer; and has such powers of a court-martial and of a court of inquiry as may be necessary.

The members are sworn in each case to discharge their duties honestly and impartially.

When the board finds an officer incapacitated for active service, from wounds, or injury received in the line of duty, from sickness or exposure therein, or from any other incident of the service, and the President approve of such finding, the disabled officer is thereupon placed upon the list of retired officers with pay equal to seventy-five per centum of the sea-pay for the grade or rank he may hold at the date of his retirement.

But if such disability or incompetency proceeded from other causes, and the President concur in opinion with the board, the officer is retired upon furlough-pay, or he is wholly retired from the service with one year's pay, at the discretion of the President; in this last case his name is wholly omitted from the navy register.

No officer of the navy may be retired because of misconduct, but he is subject to court-martial for such misconduct.

The members of the board are sworn in each case to an honest and impartial discharge of their duties; and no officer of the navy may be retired, either partially or wholly from the service, without having had a fair and full hearing before the board, if he shall demand it, except in cases where he may be retired by the President, at his own request, or on account of age, or length of service, or on account of his failure to be recommended by an examining board for promotion.—*James C. Dulin.*

Exchequered (*Eng.*). Seized by government officers as contraband.

Executive-officer. The title of "executive-officer" is of quite recent date, and has been the cause of much discussion, bad temper, and bitter opposition; it has grown from the ashes of the old *first lieutenant*, and finds its parallel in the army adjutant, and in all corporations or factories employing large bodies of men, in the name of superintendent or manager. The executive-officer holds by far the most onerous, most difficult, and most thankless office on board ship, while his authority is limited entirely by the dictum of his commander. His duties consist in stationing the officers and crew for the necessary handling of the sails and spars, in the boats, at the great guns, fire-quarters, small-arms, and in their messes; he must frequently exercise them as prescribed by navy regulations; he is always on duty, and must be ever vigilant and watchful; setting at all times a good example of neatness and prompt respectful obedience, he must exact it from all others. He must keep a conduct-roll of all the crew, setting forth all their individual merits and carefully noting all their faults. He must keep a liberty-book, in which the names of all who obtain leave are entered, the length of time granted, the hour of their return, and their condition. He must keep a punishment-book, in which any and all punishments inflicted, for what cause and by what authority, are recorded. He must listen to all complaints, and, if necessary, present them to his captain. He acts as chief of police, and must be very watchful of his immediate subordinates in that department, to suppress the smuggling of liquor, theft, fighting, and gambling. He must be ready at all times to lead the crew, to head the battalion, or show the way to the weather-earing; ready always with his gold-laced and epauletted coat for fair weather, or his trumpet and oil-skin jacket for the midnight gale. He must be ready to promote and encourage all kinds of healthful and proper amusements among the crew, such as boat-racing, glee clubs, base ball, and particularly swimming; the comfort of the crew should be his constant study. But most difficult task of all, he must, by his influence and dignity, maintain good order, frowning down all license, stopping at once all improper discussion; if he wishes the cruise to be happy, he must first of all be true and loyal to his commanding officer, never permitting officers to criticise him in the presence of the servants, never himself doing so even to the officers. He must be equally careful not needlessly to open the captain's eyes to any of the little faults or minor breaches of discipline on the part of officers or men; he must learn when and what to hear or see, and as his relations with the captain are more or less confidential, he must be exceedingly prudent in his speech. He is held responsible for the cleanliness of the ship, her good order, neat and man-of-war-like appearance, and, above all, he is to do as he is told by his captain, to *promulgate* and *execute* his orders; and, last of all his duties, never to go ashore except on the sheet-anchor.—*W. T. Truxtun, Captain U.S.N.*

Exhaust. A term applied to the mechanism for releasing steam from a cylinder after having performed its work; and, also, to the ejected steam.

EXHAUST-PIPE. A pipe for conducting exhaust steam from a cylinder to a condenser, or to the atmosphere, or to any convenient place remote from the engine. When an exhaust-pipe terminates in a chimney, and has a contracted outlet for increasing the velocity of the escaping steam and inducing a draft, the contracted termination is called a *blast-pipe.*

EXHAUST-PORT. The opening or passage in a steam-cylinder through which the exhaust steam escapes.

Exhaust Steam. The steam that is ejected from a cylinder after having performed its work.

Exhaust-valve. A valve for releasing the exhaust steam from a cylinder, or for discharging any confined fluid from a vessel or chamber.

Exmouth, Viscount (Sir Edward Pellew), a celebrated English admiral, was born at Dover in 1757. He was descended from a Norman family, settled in Cornwall for many centuries. He entered the navy at 13 years of age, and was at once remarked for his daring, activity, and intelligence. Well suited to his profession, he rose to be a typical English sailor.

His first war-service was in our own country, at the battle of Lake Champlain, when he succeeded to the command of the schooner "Carleton," and, for gallant and skillful conduct, was given a lieutenant's commission. In the next year he served in Burgoyne's unfortunate campaign, in command of a detachment of seamen, whose tremendous labor, in the lakes and rivers, was entirely thrown away by Burgoyne's capture.

In 1782 he had command of the "Pelican," and destroyed three French privateers at one time, for which service he was made a captain. At the breaking out of the war with the French, in 1793, he was in command of the "Nymphe," 36, which ship is said to have been manned mostly by landsmen. In her, however, he captured the French frigate "La Cléopatre," a heavier ship. He was knighted for this action.

In 1794 he had command of the "Arethusa" frigate, and captured the French frigate "Pomone" in the course of a general action. In the same year he was given command of the second division of the Western Squadron, where he distinguished himself.

Always noted for deeds of personal daring, one of the most remarkable of these was his boarding the wrecked transport "Sutton," shipwrecked on the coast. The danger was imminent, but he took charge, and by his personal influence and great exertions saved the lives of all on board. He is, perhaps, better known to seafaring people for this action than from his subsequent achievements.

In 1798 he commanded the "Impétueux," in the Channel Fleet, and passed creditably through several actions.

He then entered Parliament, and was known as a strenuous supporter of Pitt.

In 1804 he was made rear-admiral of the blue, and commander-in-chief in India, when, by his rapid and well-considered measures, he succeeded in nearly clearing those seas of the French cruisers which had caused such havoc. He returned to England in 1809, and the next year was appointed commander-in-chief in the North Sea.

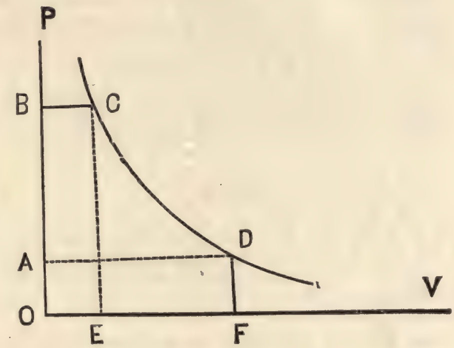
In 1811 he was commander-in-chief in the Mediterranean; and in 1814 was made Baron Exmouth, and K.C.B., and G.C.B. When, in 1816, the Dey of Algiers violated the treaty concerning prisoners, Lord Exmouth was sent out, with a powerful fleet, and made an attack upon that city, so famous in its curious history. The bombardment took place on the 26th of August, with considerable loss on the side of the English and their Dutch allies, and dreadful slaughter occurred among the Algerines. The result was the apology of the dey and the surrender of 1800 slaves. For this victory Lord Exmouth was made a viscount; and, shortly before his death, he became a vice-admiral.—*E. Shippen.*

Exocetus. A fish which comes upon the beach to sleep. A genus of fishes having very long and large pectoral fins, by means of which they are able to fly a considerable distance in the air,—the flying-fish.

Expansion. In naval architecture, the laying off the ship mathematically from a model or drawing to the full or building size. The enlargement of a body, whether solid, liquid, or gaseous, due to the separation of its atoms by heat. See Expansion of Steam, Cut-off.

Expansion of Steam. Accurate investigations of this subject are very intricate, and the formulæ deduced are complicated; but calculations sufficiently correct for many purposes may be made as follows:

Suppose a given weight of steam occupying the space represented by $O\,E = v_1$, at the pressure



$O\,B = p_1$, be admitted into a cylinder and to drive a piston; then to expand, its volume increasing to $O\,F = v_2$, and its pressure falling to $F\,D = p_2$, according to the law represented by the curve C D; and, lastly, to be expelled from the cylinder at the final pressure, then the

Energy transmitted, E =

$$\int_{p_2}^{p_1} v\,dp$$

the value of which, as given by Rankine's formula for a perfect gas, is

$$\int_{p_2}^{p_1} v\,dp = \frac{\gamma}{\gamma-1}.v_1 p_1 \left\{1 - \left(\frac{v_1}{v_2}\right)^{\gamma-1}\right\}. \quad (1)$$

when $\gamma = 1.408$ for air.

If the fluid is discharged from the cylinder at a lower pressure than that at which the expansion terminates, there is to be added to the preceding formula the term

$$v_2\,(p_2 - p_3)$$

making

$$E = \frac{\quad}{\gamma-1} v_1 p_1 \left\{1 - \left(\frac{v_1}{v_2}\right)^{\gamma-1}\right\} + v_2(p_2 - p_3) \quad (2)$$

This formula becomes still more complex for saturated steam.

Adiabatic Curve.—If the steam be allowed to expand without receiving or emitting heat, and the mechanical energy exerted during the expansion be entirely communicated to an exter-

nal body, such as a piston, the pressure p_2 will be less than it would had the temperature been maintained constant, because by expansion, heat is made to disappear. The curve C D governing the pressures of the several volumes is called an *adiabatic curve*, the simplest equation of which is, for a perfect gas,

$$p \propto \frac{1}{v^{\gamma}} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (3)$$

If the steam while expanding be maintained at a constant absolute temperature, the curve C D is called an *isothermal line.*

The line O V may be regarded as a line of absolute cold, and an asymptote to all other isothermal and adiabatic curves.

It is frequently assumed in practice that the temperature remains constant, and that

$$p \propto \frac{1}{v} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (4)$$

in which case the absolute pressure at any point of the curve C D may be represented by $\frac{p}{v}$, and the energy transmitted during an infinitely small expansion by $\frac{p}{v} d\,v$, which being integrated between the limits of $v = v_1$ and $v = v_2$, when v_1 represents the unit of measure of v_2, gives the energy transmitted during the whole expansion,

$$p_1 \int_{v_1}^{v_2} \frac{d\,v}{v} = p_1 \text{ hyp. log. } v_2 \quad . \quad . \quad . \quad (5)$$

and if the work $p_1\,v_1$, done before expansion, be added, the expression for the total energy becomes

$$\mathrm{E} = p_1 \int_{v_1}^{v_2} \frac{d\,v}{v} + p_1\,v_1 = p_1\,(\text{hyp. log. } v_2 + 1) \quad (6)$$

By subtracting the back-pressure $p_3\ v_2$, and denoting the total mean pressure by Pm, the effective energy

$$\mathrm{E}_1 = p_1\,(\text{hyp. log. } v_2 + 1) - p_3 v_2 = Pm.\,v_2 - p_3 v_2 \quad (7)$$

Mean pressure

$$Pm = p_1\,\frac{\text{hyp. log. } v_2 + 1}{v_2} \quad . \quad . \quad . \quad (8)$$

Initial pressure, when the mean pressure is given,

$$p_1 = \frac{Pm\,v_2}{\text{hyp. log. } v_2 + 1} \quad . \quad . \quad . \quad . \quad (9)$$

The relative weight of steam required to maintain a constant mean pressure for various grades of expansion may be represented by the cylinder full of steam at the final pressure, or,

$$p_2 = \frac{p_1}{v_2} = \frac{Pm}{\text{hyp. log. } v_2 + 1} \quad . \quad . \quad (10)$$

Suppose Pm to be unity and constant, then if

	Per Cent. of Gain. Successive.	Total.
$v_2 = v_1,\ p_1 = 1.00;\ p_2 = 1.000$		
$v_2 = 2v,\ p_1 = 1.18;\ p_2 = 0.590$	41	41
$v_2 = 4v,\ p_1 = 1.67;\ p_2 = 0.419$	17.1	58.1
$v_2 = 8v,\ p_1 = 2.65;\ p_2 = 0.325$	9.4	67.5
$v_2 = 16v,\ p_1 = 4.21;\ p_2 = 0.278$	4.7	72.2

This is a maximum result, and not nearly attainable in practice. By applying the exact thermo-dynamic laws of expansion, and deducting the losses by back-pressure, clearance, and friction of larger engine required, which increases with the several values of p_1, the per cent. of gain will be materially reduced.—*Albert Aston, Chief Engineer U.S.N.*

Expansion-gear. In the steam-engine, the mechanism for operating an expansion or cut-off valve.

Expansion-valve. See Cut-off.

Expedition. An undertaking by sea or land, with a peaceful design or with hostile intent. See Exploring Expeditions.

Expend. To use up or consume in service.

Exploit. An achievement; a feat; a successful deed.

Exploring Expeditions. Exploring expeditions, to examine coasts and seas unknown or imperfectly surveyed, have been undertaken from the earliest times. Maritime exploration, however, has never been so fruitful as within the past four hundred years. The earlier expeditions were of a commercial nature, and this was doubtless the motive that induced Jason to undertake the Argonautic expedition, the first in history,—1250–60 B.C. The great Egyptian monarch, Pharaoh Necho, is said to have obtained the circumnavigation of Africa, 630 B.C.,—Phœnicians, under his orders, performing it by landing and sowing grain during the summer, thus occupying three years in the voyage. During the three centuries preceding the birth of Christ, the Carthaginians led the van in maritime discovery. Impelled by a mercantile spirit, they discovered the Scilly Islands, explored the coast of Spain, Africa as far as Cape Nun, which Hanno is said to have reached. Nearchus, the admiral of Alexander's fleet, made many important explorations of the coasts and islands of the Persian Gulf during his five months' voyage. The geographical knowledge disseminated by the writings of Erastosthenes, Strabo, Hipparchus, and Ptolemy prepared the way for the modern science of geography, and led to the development of maritime discovery and exploration after the nations had arisen from the wreck of the barbarian incursions, and when better navigation and sounder ships enabled such voyages to be undertaken. Aside from the general decay of knowledge, the unsettled state of society, and the prevalence of piracy at sea, the dominant nation for centuries—the Romans—were not a maritime people, and sought their triumphs by land. The navigation of those times was confined to coasting from head to headland; the stars and landmarks were the only guides, and daytime and the favorable seasons only were employed in navigation. But about the middle of the 14th century the mariner's compass was introduced; ships able to breast the stronger waves of the Atlantic, and able to sail with a *side wind*, were built; maps and charts of better construction appeared; the astrolabe, the first astronomical instrument of navigation, was invented, and a maritime school was established by Prince Henry of Portugal. The expeditions sent from there greatly encouraged adventurous mariners to penetrate farther into the unknown west, and these voyages soon bore fruit.

The first exploring vessel was sent out in 1410, and reached Cape Nun, and this initiatory voyage was followed by others, sent by Henry

and the kings of Portugal. In 1416 a vessel reached Cape Bojador, and in 1418, Juan Gonçalves Zarco, in a *barcha*, with Tristan Vaz Teixera, sailed on a voyage of discovery, and, being blown off the coast, discovered Porto Santo, one of the Madeiras. In 1420, they again sailed, with three vessels, discovered Madeira (visited before by an Englishman), and burned its woods, planting the vine and sugar-cane. Gil Eanez, in 1420, tried to pass Cape Bojador, but failed, succeeding, however, in a second voyage in 1433. In two succeeding voyages he finally reached Rio do Ouro, or Gold River. In 1432, Cabral was sent out by Prince Henry, and discovered the Azores. Expeditions were undertaken in 1440 (defeated by stress of weather), in 1441, and in 1442, more for plunder than for discovery, but gold was then first found. In 1443, Nuñez Tristan, who had commanded the last two expeditions, again sailed, advancing as far as Alguin Bay, and to the Gambia River in a succeeding voyage. No important discoveries were made in the three succeeding voyages. In 1447, Lançarot, with several caravels, explored as far as the Senegal River. In 1455, Cada Mosto, a Venetian, sailed in a Portuguese caravel, and again in 1456, with two caravels, exploring and describing the coast, then discovered the Cape Verde Islands; and the same year De Cintra and De Costa, with two vessels, went as far as Cape Mesurado. This was the last expedition under Prince Henry, the founder of modern discovery and exploration. In 1471, Santarem and Escobar discovered the Gold Coast and Cape St. Catherine. The trade with Africa was farmed by the Portuguese government, and discovery relaxed somewhat. Under John the Perfect it again revived, and the attention of other nations to the subject was soon manifested by their attempts. In 1484, Diego Cam reached the Congo River, and in 1487, Bartholomew Diaz sailed with 3 caravels, discovered the cape at the southern point of Africa, and named it Cabo Tormentoso. In 1484–86, Martin Beheim is said to have reached Brazil, but accounts of this are vague. These voyages paved the way for the great explorer, Christopher Columbus. Ferdinand of Spain was induced to grant him 3 vessels and 90 men, and he sailed from Palos, Spain, August 3, 1492. He touched at the Canaries, and then boldly struck towards the west. Previous explorers had kept nearer the land, until accidental discoveries of the islands led them there in subsequent voyages; but Columbus, firmly believing in the rotundity of the earth, boldly sought the Indies by sailing around it. His timorous sailors feared the unknown sea, and nearly frustrated his plans; but finally he was rewarded by a sight of the land, and on Friday, October 12, he discovered Guanahani, which he called San Salvador. He discovered Long Island, Exuma Island, and Watling's Island in the course of his explorations this voyage, and Cuba on the 28th October, and St. Domingo on December 6. He lost his flag-ship, but got safely back, touching at the Azores and the mouth of the Tagus, and arriving at Burgos, Spain, March 15, 1493. The news of his discovery of the Indies spread abroad, and soon other explorers were seeking western lands. A papal bull granted these waters to the Spanish, reserving to the Portuguese explorations east of a line at first 100 leagues, afterwards 370 leagues, west of the Azores. Columbus sailed, as viceroy of the new country, with 17 ships and 150 men, to colonize the new lands, September 25, 1493. On the 3d November he discovered Dominica (Sunday) Island, and Marie-Galante, Guadeloupe, Montserrat, Antigua, St. Matthew, St. Bartholomew, Santa Cruz, Porto Rico, and others in succession, arriving at the latter island April 24, 1494. He sailed with 3 vessels April 24, 1494, discovered many islands near Cuba, explored its coasts, discovered Jamaica May 14, and the islands in the Mona passage. He sailed on his third voyage with 6 ships May 19, 1497, and then discovered the coast of Venezuela, Trinidad, and other islands, and, on arriving at Hispaniola, was sent home in chains.

In his fourth voyage, with 2 ships and 170 men, in 1502, he explored the coast of Honduras, and this was his last exploit.

England was the first to profit by the discovery, and John and Sebastian Cabot sailed in June, 1496, with 2 ships and 300 men. They discovered the island of Newfoundland, and explored the continent as far as Chesapeake Bay. Sebastian Cabot afterwards sailed on other expeditions,—the first in the Spanish service, to South America, and subsequent ones in search of northwest and northeast passages. These latter voyages belong to Polar exploration.

The Portuguese king sent out in 1496 Vasco da Gama with 4 ships and 120 men. He sailed July 9, 1496, explored the coast of Africa, passed the Stormy Cape, now Good Hope, discovered Mozambique, and first found the passage to India, laying the track for future voyages. Jealous of the Spanish discoveries in the west, Ojeda and Vespucci were sent in 1499, by the Portuguese king, with 4 ships. They discovered the continent of South America, about the Orinoco, and in a second voyage discovered Brazil. Amerigo Vespucci, the pilot of these expeditions, sailed again in 1501 with 3 ships, explored the Brazilian coast, and crossed to Africa. In 1503, with 6 ships, he discovered St. Matthew Island and Bahia, and first published accounts of the new world, which became known as *America*.

With the new century the spirit of discovery and exploration started afresh. The Portuguese, first to open the way, led the van in the 16th century also. Pedro Alvarez Cabral sailed in 1500 with 12 ships and 1500 men, partly to colonize the new Indian possessions. He sailed March 8, explored the coast of Brazil, crossed to Africa, doubled the Cape of Good Hope, and touched at Sofala, exploring much of the coast. At the same time Gaspar de Cortereal sailed with 2 vessels to the westward, explored Newfoundland, discovered the St. Lawrence and Labrador, and named them. Returning on a second voyage, in 1502, he was lost. From 1500 to 1510 many expeditions were sent from Portugal to India, but they were for colonization and trade, although in many of them important discoveries were made. Albuquerque discovered Zanzibar in 1503. Juan de Nova Castella first saw St. Helena in 1502. Tristan d'Acunha discovered the island called after him in 1506, and Madagascar in 1507. Diego Lopez de Sequerem explored the coasts of Malacca and Sumatra, and many other discoveries were made by traders and India fleets. Spain was not idle. In 1508, Vincente Jañez Purzon and Juan de Solis sailed along

the coast of South America from the equator to 40° S. In 1512, De Solis explored the whole coast of Brazil, and discovered the La Plata and the Parana, and colonies were soon planted there. The same year Juan Ponce de Leon sailed from the Spanish colonies and discovered Florida. In 1517, Cordova explored the coast of Campeachy, in 1518, Juan de Grijalva the coast of Honduras, and the same year Francis de Garay sailed down the coast of Florida. The following year saw the advent of Fernando Cortez and the establishment of a Spanish kingdom on the continent, and many voyages of discovery ensued thereafter.

But the greatest maritime event that had happened since the voyage of Da Gama was that of Magalhaens. He sailed from Seville in 1519, on the 20th of September. After exploring the coast of Brazil, and wintering in Patagonia, he sailed through the straits that bear his name. Of his 5 ships, one was here lost and one returned to Spain, but he pushed into the hitherto unexplored South Sea, discovered the Ladrones, Philippines, Jardines, and other islands in that sea, and was killed at Zebu. One vessel reached San Lucar, Sept. 6, 1522, with 18 men, and thus the first circumnavigation of the globe was accomplished in 1154 days. Cortez and subsequent viceroys of New Spain sent out many expeditions of discovery and exploration from 1520 to 1524. In 1525, Francis Pizarro and Diego de Almagro sailed south and discovered Peru, afterwards conquering it and establishing an empire there. A fleet of 7 vessels sailed from Corunna in the same year, one of them sailing around the continent of South America, the others going to the Moluccas.

Francis I. sent John Verrazzani, 1523, to explore the new continent, and again in 1524. He is said to have discovered Florida, before seen by Ponce de Leon.

Sebastian Cabot sailed again for the king of Spain in 1526, explored the La Plata, ascended north 120 miles in his ships, and 480 miles farther in boats; also exploring the Parana and Paraguay Rivers. Cortez sent Alvarda de Saavedra, in 1527, into the South Seas, and New Guinea was then first seen, and many smaller islands. Francis I. sent Jacques Cartier from St. Malo with 2 ships of 60 tons in 1534. He explored Labrador, discovered the Magdalen Islands, Chaleur and Gaspé Bays, and took possession of the new country in the name of the king of France. In a second voyage, in 1535, he sailed through Belleisle Straits, and explored the St. Lawrence and Saguenay, wintering there. In a third voyage, in 1541, he made other explorations of Canada under the command of Roberval. In 1536, Cortez sent Juan de Grijalva to explore the west coast of America, and the same year himself sailed, discovering the Gulf and peninsula of California. The same year Grijalva sailed into the South Seas, and discovered many islands about the Moluccas, Spice, and Philippine groups. In 1539, Francis de Ulloa explored both shores of the Gulf of California, and the west coast of the peninsula as far as 32° north latitude. In 1540, Orellana explored the Amazon, and in 1541 Don Stephen de Gama explored the Red Sea, Abyssinian coast, and Arabian shores. In 1542, another Spanish fleet, exploring the west coast of America, sailed north to 40°, and saw the Sierra Nevadas. The same year a fleet of 6 vessels sailed into the South Sea, and discovered the Pelew and other islands. The next year De la Torre explored the Philippines. The Spaniards, anxious to reach their new possessions, sent expeditions to find the northwest passage, and, in 1542, Cabrillo explored the coast of California as far as 44° north, naming Cape Mendocino. The voyages of Frobisher, Smith, and Davis belong to Polar exploration. In 1553, Sir Hugh Willoughby and Richard Chancellor passed Norway, and sailed into the White Sea. In 1562, Jean de Ribaut sailed with 2 vessels from France, and explored the coast of Florida and South Carolina. The voyage of Drake in 1577, important from discoveries made, was a predatory incursion against Spanish commerce. In 1582, Gualle, under Spanish colors, first explored the seas north of Japan, discovered New Georgia and many other points on the northwest coast of America. Cavendish sailed July 2, 1586, with 3 vessels on a voyage of discovery. He explored the coast of California, traversed the South Seas, and sailed around the globe, discovering many islands in his voyages. He essayed a second voyage, but died at its commencement, and nothing was accomplished. Hawkins discovered the Falkland Islands in 1586, and the Dutch sent several expeditions in search of the northwest passage. But the wars between Spain and England paralyzed discovery during the latter part of the century. Much remained yet to be explored.

The next century opened with brighter promise to the explorer. The invention of the telescope (1609), of the octant in 1732, of chronometers in 1736, and the improvement in maps and charts by Mercator (1550) and Wright (1559), the progress in astronomy by the studies of Galileo, Copernicus, and Tycho Brahe, habitude in making longer voyages at sea, and better ships, gave the mariner better instruments and more exact means of making these voyages successful.

The first to open the way of discovery was Hendrik Hudson. His first voyage, in 1607, was in search of the northwest passage, and he explored Greenland. His second voyage was to the northeastward, but the ice stopped him. It is his third voyage that concerns us, when he discovered the river that bears his name, sailing up it to the head of navigation. His fourth voyage belongs to Polar exploration. In a voyage of a warlike nature in 1606–7, Van Voort discovered New Holland. In 1607, Quiros sailed to the South Sea in search of a continent, and discovered Otaheite. Le Maire and Schouten sailed from Holland in 1675 with 2 ships in search of the same continent and a passage to India. They discovered Le Maire Straits and Staten Land, first doubled and named Cape Horn, and discovered many islands in the Pacific, and also New Zealand and New Guinea. Baffin's voyage in 1619 was Arctic, and exploration flagged for a while.

In 1642, Abel Jansen Tasman sailed with 3 ships from Batavia. He discovered Tasmania on the 24th of November, 1642, naming it Van Diemen's Land. Van Vlaming explored carefully the coast of New Holland towards the close of the century. An expedition under De Vries explored the waters north of Japan. Dampier's voyages, adding much to our knowledge of the East Indies, at the close of this and the

beginning of the next century, were buccaneering expeditions, and many discoveries were made during the privateering voyages of Capt. Woods Rogers in 1708–11.

But the first exploring voyage of the 18th century was that of Vitus Behring, a Russian, in Arctic regions. He first ascertained Kamskatka to be a peninsula. A Russian trading company made many discoveries in their mercantile voyages. Capt. John Clipperton explored the coast of China in 1719, and Capt. Shelvocke explored farther the northwest coast of America, and sailed round the world.

The Dutch East India Company sent an expedition of 3 ships under Commodore Roggewein in 1721, to explore the southern continent. Visiting Brazil, they rounded Cape Horn, discovered Easter Island, Aurora Island, Roggewein and other islands, coasted New Guinea and the Moluccas. His ships were seized at Batavia, and he went home in the company's ships, sailing around the world.

The voyage of Lord Anson, 1740–43, was against Spanish commerce, although many discoveries were made. Admiral Byron sailed on a voyage of discovery from England in 1764, explored the Straits of Magellan, discovered Disappointment, Danger, and many other islands in the South Sea, explored the Solomon and Ladrone Islands, and sailed around the world. Capt. Wallis, in his voyages, 1766–68, sailed around the world, discovered Whitsun Island, Queen Charlotte Island, Egmont Island, Wallis Island, and others, giving their positions carefully. Capt. Philip Carteret, sailing with him from England, parted company at the Straits of Magellan, sailing to the southward, and discovered Osnaburgh, Keppel, Volcano, Duke of Gloucester, and other islands, explored New Britain, New Ireland, Philippine, Celebes, and other groups, and sailed around the world. But the most famed navigator of the century was Capt. James Cook. He first sailed in 1768, with astronomers, to observe the transit of Venus. Patagonia, Tierra del Fuego, Le Maire Straits, and other localities were more carefully explored and described, and Cook sailed to the southward as far as 60°, then sailed north, discovered many islands in the Society group, and landed at Otaheite. That and the neighboring islands were thoroughly and carefully explored. He then coasted along the islands of New Zealand and New Guinea, and the continent of Australia. He then returned by way of Batavia and Cape of Good Hope. The same year that Cook sailed, Louis de Bougainville was sent out from France. After surrendering the Falkland Islands to England, he sailed with 2 vessels into the South Sea, discovered Dangerous Archipelago, visited Tahiti, named Pentecost Island, and, touching at Batavia, completed the circuit of the globe. Cook's second voyage, in the "Resolution" and "Adventure," began July 13, 1772. He went to the southward of America, the first to penetrate into the icy sea, advancing as far as lat. 71°. He believed that he had disproved the existence of a continent there. He then explored New Hebrides and New Caledonia, Society and Friendly Islands, and discovered the Sandwich Islands. His third voyage was undertaken in 1778, when he explored the Sandwich Islands and the northwest coast of America, advancing as far as lat. 70° 40′ north. He was killed February 14, 1779, at the Sandwich Islands, and little was accomplished during the rest of the voyage. The voyage of Capt. Phipps, in 1773, in which Nelson was engaged, belongs to Arctic exploration. The Spaniards explored the west coast of North America, advancing in 1775 as far as 58° north. The unfortunate La Perouse sailed with 2 vessels from Brest, August 1, 1785, on a voyage of discovery. Carefully exploring and mapping the west coast of North America, from lat. 60° to Monterey, he sailed south, and after many discoveries in the South Seas, his vessels were lost. An expedition sent in search of them, under D'Entrecasteaux, explored Van Diemen's Land, New Caledonia, New Hebrides, New Zealand, and other islands, in 1791. In 1791, George Vancouver sailed with 2 ships from England. He surveyed the Sandwich Islands and the coast of Northwest America, naming the island that still is called after him. The French sent Kerguelen to find the southern continent, which he imagined he had done on his first voyage, but a second proved it to be a barren island, now called by his name.

The present century has been fruitful in exploration, but by far the greater part of this has been directed to the Arctic regions, and will not detain us. Many important expeditions of general discovery and exploration have nevertheless been undertaken. England was the first to inaugurate the century, and Capt. Flinders, in July, 1801, sailed to explore Australia. He made careful surveys of much of the Australian coast, of Northumberland and Cumberland Islands, and added greatly to the knowledge of these distant lands. He was detained by the French government, and did not reach England until 1810. The expedition of Krusenstern, in 1803–6, was intended to establish relations with Japan; and although this object failed, he surveyed much of the coasts of North America and Asia.

In 1815 the Russians followed this up by sending Kotzebue on an exploring tour. He spent three years exploring the north coast of America and Asia, and made many discoveries in the South Sea, in this and another voyage in 1823. In 1817, De Freycinet, a French navigator, explored the South Seas, adding much to our knowledge of them. In 1819, Capt. Bellingham, a Russian, went as far south as 70° latitude; and in 1821 he discovered Alexis and Peter's Island, near the Antarctic continent. Capt. Weddel, in sealing voyages, went as far as 74° south in 1823, and made discoveries in Antarctic regions. Capt. Biscoe, in 1832, in sealing voyages, discovered Graham Land, a part of the southern continent. In 1836, Sir Edward Belcher sailed on a voyage around the world in the "Sulphur," and made valuable explorations of the islands and countries in the South Sea, adding greatly to the hydrographic knowledge of those localities. In 1838, the first American exploring expedition of magnitude sailed. Lieut. Charles Wilkes, in command of 5 vessels, left Norfolk, August 18, 1838, and spent four years in an exploration of the globe. After touching at Madeira, Cape Verde, and Rio, the fleet separated, reuniting after an exploration of the waters about Cape Horn. The

Paumotoo, Tahiti, and Samoan Islands were then explored, many new islands being discovered, and Wallis and Sydney visited. Capt. Wilkes then sailed southward, and three of his vessels found the Antarctic continent, Wilkes following north up to 70° longitude. The existence of a continent, disbelieved by Cook, was thus proven. Wilkes then visited New Zealand, Feejee Islands, Sandwich Islands, and explored the Columbia and Sacramento Rivers. He sailed from America again, November 1, 1841, visited Manilla, Sooloo Archipelago, Borneo, and Singapore, and arrived at New York, June 10, 1842, having lost 2 of his vessels. Wilkes sailed along 3000 miles of the Antarctic continent; and the same year (1840) D'Urville, sent out by the French government, sailing from Hobart Town, discovered the same land, coasting from 136° to 142° east longitude. D'Urville made many other explorations in the South Seas during his two years' voyage. Sir James Ross sailed from England in 1839 with 2 vessels, and discovered the same continent in 1841, naming two mountains that he saw "Erebus" and "Terror," and ascended to 78° 10′ north, the farthest that has yet been attained in those regions. He afterwards, in 1842, visited Graham Land and Shetland, reaching 72° latitude on that side of the pole.

In 1852, Commander Lynch explored the coast of Africa, ascending many of the rivers, from the Gambia to Liberia. The same year, a second exploring expedition of 5 vessels sailed from the United States, commanded by Capt. Ringgold. After reaching Cape of Good Hope, the squadron divided into two, and explored Van Diemen's Land, Caroline Islands, Ladrone Islands, and Bonin Islands, the Sunda Straits, Sooloo Sea, and the fleet assembled at Hong-Kong. There Lieut. John Rodgers succeeded to the command, and explored and surveyed the Bonin, Ladrone, and Loochoo Islands. One vessel was lost, but surveys were subsequently prosecuted among the islands to the south of Japan, in the Kurile, among the Aleutian Islands, and in Behring's Straits. Lieut. Rodgers advanced as far as 72° north in the Arctic regions, and the expedition returned in 1855. In 1856, Commander Page surveyed the La Plata and Parana Rivers in a steam-vessel, the "Water-Witch," until a rupture with the Paraguayan authorities compelled him to quit. Besides these, other expeditions of a local nature have taken place to survey the Isthmus of Panama, the Amazon River, or for the exploration of the continents of Australia and Africa, but these properly belong to inland travels.—*F. S. Bassett*, *Lieutenant U.S.N.* See Polar Exploration.

Explosion. See Explosives.

Explosives. *Explosion.* The sudden and violent expansion of a body by its component parts acquiring a great increase of bulk.—*Encyc.*

A bursting with noise; a bursting with a sudden expansion of any elastic fluid with force and a loud report.—*Dict.*

These definitions include many actions of a physical character, such as the bursting of steam-boilers, and the term is also applied to the sound, to the effect, etc. More strictly, explosion means the result of chemical action occurring in certain substances called explosive agents or explosives. In this sense the word is synonymous with explosive reaction, and may be defined as a chemical action which causes the sudden, or extremely rapid, formation of a very great volume of highly expanded gas. An explosive reaction does not differ in kind from other chemical reactions, but only in degree. The explosive character of a reaction depends upon its possessing the two essential features, great change of state, and quickness of action. The volume of the gas produced is very much greater than that of the substance from which it is derived, and it is still more expanded by the heat evolved during the action. The greater the volume of the expanded gas the more powerful the explosion, and *vice versa.* The time required for the occurrence of the change must be very short, and the shorter it is, the more highly explosive the reaction becomes.

Conditions of Explosion.—The amount and kinds of gas given off in an explosive reaction, depend upon the chemical composition of the explosive substance and the character of the change it undergoes. The conditions or circumstances of explosion may affect these results considerably. Thus, gunpowder fired in a mortar gives different products than when fired unconfined, and nitro-glycerine exploded under certain circumstances gives noxious gases which are not found under other conditions. Practically, however, the effect of condition on the character of the change is mostly seen in the comparative rapidity of the action.

The physical or mechanical condition of the explosive substance is of much importance. Thus, dynamite avoids the inconveniences of the liquid form of nitro-glycerine, while it preserves unimpaired the readiness of explosion by the appropriate means. Gunpowder, in large grains and highly compressed, burns more slowly than if in small grains, or of low density. Gun-cotton in its various mechanical states passes through all gradations from rapid burning to sudden and violent explosion.

Confinement is the principal external condition affecting an explosion. Confinement is necessary to obtain the full effect of an explosive, but the more rapid the action the less the confinement needed. Yet even the quickest of explosives, like a fulminate or chloride of nitrogen, requires a certain confinement to develop its power. With the rapidly acting agents, however, the amount of confinement required is small, and is usually obtained necessarily in use. The slower substances, like gunpowder, require strong confinement, in order to allow time for the spread of the action through the mass of the charge. Or, means may be taken to quicken their action, as by special modes of firing, and so the confinement needed diminished.

The explosive reaction is very much influenced by the manner of bringing it about. The effect obtained when a substance is exploded by a sharp shock or blow, derived from the explosion of a fulminate, is very different from that produced when firing is caused by a flame. This difference is due to the greater rapidity of transmission of the exploding impulse through the mass of the material acted on. The transmission of the ignition by flame proceeds more slowly from particle to particle. Consequently, when a fulminate is the exploding agent, the time of action is shortened, so that the explosion becomes

sharper and more violent. The term *detonation* is applied to the sudden and violent explosion produced in this way. The action of the detonator may be well compared to a sudden application of a powerful mechanical force, like a blow from a heavy hammer. The particles of gas from the initial explosion strike percussively upon the particles of the mass to be fired, and meeting with resistance, their energy is converted into heat. But the effectiveness of this action will evidently very largely depend upon the suddenness of the percussive blow. In general, then, it may be said that the readiness with which the explosion of one body will produce that of another will be governed by the amount of force it gives *in the shortest time.*

While this is true in the main, it does not account for certain peculiarities attending explosions. An explosive body is one which is readily affected by disturbing actions. Its parts are held together in a nicely balanced equilibrium, which is easily overbalanced, and the destruction of the system results. The extremely sudden application of great mechanical force tends directly to the disorganization of the body. But there are certain forms of force, or modes of applying force, to which the substance is more sensitive than it is to others. It is found that fulminating mercury is much more effective and ready in producing the explosion of other bodies than many agents which are more powerful or even more sudden. This is as if the shock or blow of the fulminate had some peculiar quality to which other substances were sensitive. The fulminate gives an impulse or vibration to which the others respond, and which, therefore, exerts a greater disturbing action upon them than is caused by a mechanical excitement which does not possess this special vibration. This theory, which is due to Abel, has been strongly supported by his experiments, and by those of Champion and Pellet. The latter have shown that the vibrations produced by different explosions are unlike, and that certain vibratory motions produced explosion more readily than others.

The distinction between detonation and simple explosion is one of degree, and not of kind. The essential peculiarity of the detonation is found in the shortness of the time required for it. Perfect detonation, then, is the instantaneous explosion of the whole mass of a body. There is a great difference in explosive substances in regard to their susceptibility to detonation. Some, like nitro-glycerine, gun-cotton, and the fulminates, are readily detonated, and are known as the detonating explosives. Probably all explosives can be detonated, if the proper method is taken. Evidently, however, detonation will be much less readily brought about with a mechanical mixture like gunpowder than with a definite compound like nitro-glycerine. Still, as has been shown by Abel and by Roux and Sarrau, gunpowder can be exploded with much more violence when the mode of firing is an initial explosion of fulminate (Abel) or of nitro-glycerine (Roux and Sarrau) than when it is a simple inflammation.

Relative Force of Explosive Agents.—Knowing the composition of the explosive, the resultants of the reaction and the heat evolved can be determined, and from these data a comparison of force may be drawn. Berthelot calculates the quantity of heat generated and the volume of gas formed. The product of these numbers gives him a "term of comparison between the pressures," which, though not an exact measure of the true pressure, is obtained from two characteristic and experimental elements.

The following table shows some of his results:

Explosive Substance.	Quantity of Heat evolved per kilo.	Volume of Gas formed.	Product of two preceding Numbers.	Ratio.
	cal.	*m. c.*		
Sporting-powder	641,000	0.216	139,000	1.01
War-powder	608,000	0.225	137,000	1
Blasting-powder	510,000	0.173	88,000	0.64
Nitrate of soda powder	764,000	0.248	190,000	1.38
Chloride of nitrogen	316,000	0.370	117,000	0.85
Nitro-glycerine	1,320,000	0.710	939,000	6.85
Gun-cotton	590,000	0.801	472,000	3.44
Nitrated gun-cotton	989,000	0.484	480,000	3.5
Chlorated gun-cotton	1,420,000	0.484	680,000	4.96

This comparison, he claims, "accords in general with experience."

Sarrau considers that the force of an explosive substance is nearly proportional to the product of its heat of combustion by the weight of the permanent gas produced by the combustion. From experimental determinations of the weights of permanent gas given off on explosion, he calculates the force of some explosive substances, and thence derives the following table, showing the relative force they exert. In this table the force exhibited by powder is taken as unity, and is the mean of determinations made with five varieties.

Name of Substance.	Relative Force.
Saltpetre powder	1
Chloride of nitrogen	1.08
Nitro-glycerine	4.55
Gun-cotton	3.06
Picrate of potash	1.98
Mixture of 55 pts. picrate of potash and 45 pts. saltpetre	1.49
Mixture of equal weights of picrate and chlorate of potash	1.82

If the character of the chemical change occurring in an explosion were perfectly known the total force exerted might be calculated, but a comparison based upon such calculations would not certainly give the relative useful effect. For the circumstances of use seriously affect the relative *practical* value. Under certain conditions, the detonating explosives are much more effective than the slower ones, while in other cases the reverse may be true. Therefore, whatever may be the relative force *possessed* by the different explosive substances, their *comparative value* must be obtained from the results of practice, and then it will be found that the comparison will vary with the conditions of use.

Roux and Sarrau give a comparison of relative force derived from direct experiment. The relative effects were approximately measured by determining the quantity of each substance required to rupture cast-iron shells of nearly equal strength. They also used two modes of firing, so that they had explosions of the first order, or detonations produced by fulminate (except with gunpowder when nitro-glycerine was taken), and explosions of the second order, or simple explosions, produced by the application of flame.

Some of their results are given in the table below:

Name of Substance.	Explosive Force. 1st order.	2d order.
Mercury fulminate	928	.....
Gunpowder	434	100
Nitro-glycerine	1013	480
Gun-cotton	646	300
Potassium picrate	531	182

Considering the ordinary circumstances of practice, the following comparison may be said to indicate about the average relative force of the usual explosive agents:

Name of Substance.	Relative Force.
Gunpowder	1
Nitro-glycerine	8 to 10
Dynamite, 75% nitro-glycerine	6
Gun-cotton	4 to 6
Picric powder, from ammonium picrate	2 to 2.5

General Composition of Explosives.—Many substances are known possessing explosive properties to a greater or less extent, but of these few are of practical value as explosive agents. It is convenient to divide explosives into explosive compounds and explosive mixtures. In a compound, the elements composing it are in chemical combination, while a mixture is prepared by mixing mechanically the ingredients which make it up.

Explosive compounds, with some unimportant exceptions, are essentially composed of carbon, hydrogen, oxygen, and nitrogen. On explosion, the carbon and hydrogen unite with the oxygen to form carbonic acid gas and water (gaseous at the temperature of the reaction), and the nitrogen is set free. The action, then, is like an ordinary combustion, except that it is extremely intense and rapid from the previous intimate association and intermixture of the combustible with the oxygen. The nitrogen plays a very important part in such a compound. It brings into the body a large proportion of oxygen, which it readily yields to the carbon when decomposition occurs. As its attractive power for other elements is feeble, its presence in the compound confers the ready decomposibility necessary to an explosion.

Explosive mixtures, properly so called, are those in which the explosive property is dependent upon the fact of mixture,—that is, the ingredients of the mixture do not have explosive properties separately from it. Gunpowder is such an explosive mixture, as sulphur, charcoal, and saltpetre are not explosive substances, but the explosive property is attained when mixing has been accomplished. In principle, explosive mixtures of this sort are very simple in composition and all essentially alike. In general, two kinds of ingredients go to make such an explosive agent, one being combustible and the other capable of furnishing oxygen. The principal combustible body is almost invariably carbon or some carbonaceous substance which also contains hydrogen. Sometimes sulphur, or other oxidizable material, may be a constituent. The body supplying the oxygen is, in nearly all cases, a nitrate or a chlorate, either of which is a powerful oxidizing agent. In a nitrate, the oxygen is retained with considerable force, so that a strong external influence is required to separate it. In general then, the mixtures made from the nitrates are not very easily exploded, and their action is comparatively moderate. They are not sensitive to mechanical actions like friction or percussion. The chlorates yield their oxygen much more readily, and mixtures containing them are very sensitive to friction and percussion and explode with great sharpness. Of the nitrates, the potassium and sodium salts are the only ones used to any extent in practice. They enter into the numerous compositions included under gunpowder. Of the chlorates, the potassium salt is the only one used in the preparation of explosive mixtures.

Evidently, the number of possible explosive mixtures is great, since there are many substances of a combustible nature. The action taking place on explosion is the same in all. The carbon is oxidized to carbonic acid gas and the hydrogen to water (steam) with the evolution of great heat and, if a nitrate is present, its nitrogen is set free. Other substances remain behind in the solid residue, or also enter into the formation of gas. This action is very similar to that of an ordinary combustion of carbonaceous fuel, intensified and hastened by the previous mixture of the materials.

There is another and numerous class of mixtures having explosive properties which contain explosive compounds. The object of the mechanical mixing performed in preparing these agents is not to gain thereby the explosive property, but to obtain some advantage in use or handling. Thus, nitro-glycerine is found in a great number of mechanical mixtures, but in them all it is still the same body, and it is the explosive power of the nitro-glycerine which gives value to the mixture. It is therefore better, as well as more convenient, to treat such mixtures in connection with the explosive compounds to which they belong.

The principal explosive compounds which demand particular consideration are Nitro-glycerine, Gun-cotton, the Fulminates, and the Picrates.

Of the explosive mixtures, gunpowder in its somewhat varied forms is the most important. But as gunpowder is the subject of a separate article (q. v.) it will not be specially treated in this one. It will only be necessary to briefly allude to some others of the mixtures.

NITRO-GLYCERINE.—*Syn.* Nitrin; Glyceryl Nitrate; Glonoin, or Blasting Oil.

History and Modes of Manufacture.—Discovered by Sobrero in Pelouze's laboratory, in Paris, in 1847; first applied as an explosive agent by Alfred Nobel, in 1863. When first brought into use numerous severe accidents created a strong prejudice against nitro-glycerine, which has been gradually removed as its properties and mode of preparation have become better understood. Its practicable use as a blasting agent was brought about by Nobel's discovery that fulminating mercury exploded it perfectly. In 1866 dynamite was brought out, by which the power of nitro-glycerine is retained in a more convenient form, while its dangers are largely avoided. So that now, nitro-glycerine and its preparations are very extensively used all over the world.

Nitro-glycerine is formed by the action of concentrated nitric acid upon glycerine at a low temperature. The method of making it consists, essentially, of the careful mixing of the glycerine with the acid, the separation of the nitro-gly-

cerine, and its thorough washing. The strongest nitric acid attainable must be used (sp. gr. 1.5, not less than 1.45). The glycerine must be pure and nearly anhydrous. In order to take up the water, which is a by-product of the reaction, the nitric acid is mixed with twice its weight of sulphuric acid (oil of vitriol). The sulphuric acid takes no direct part in the formation of the nitro-glycerine, but serves to prevent the dilution of the nitric acid.

Nobel's Method.—In a leaden tank is placed a large quantity of the mixed acid. This tank stands in a wooden outer tub, with space between for the circulation of cold water. In the tank revolves a shaft carrying paddles, and also a cylinder on hollow bearings, so that a current of cold water can be sent through. This cylinder and paddles serve to agitate the liquid, insuring the rapid mixture of the glycerine with the acid, and aid in cooling. The glycerine runs in a fine stream from a vessel above, upon the upper surface of the cylinder. Sometimes, instead of the revolving cylinder, a coil of pipe for the transmission of cold water is placed in the tank and a vertical agitator in the centre. At some factories the tank is of iron, and has a coil of iron pipe. Over the top of the apparatus should be placed a hood or draft arrangement for carrying off fumes. After the mixing of the glycerine with the acid has been accomplished, the liquid is run off into a large volume of water, which dilutes the sulphuric acid, while the nitro-glycerine separates and falls to the bottom of the tub, as it is a heavy liquid, not miscible with water. It is then drawn off for washing by repeated agitations with water and alkaline solution.

Mowbray's Method.—The mixed acid is placed in earthenware pitchers, which stand in troughs surrounded by ice and water. Behind the troughs passes a pipe, bringing compressed and cooled air, which is forced down into the acid mixture through glass tubes, connected by rubber tubing, to jets on the air main. On a shelf over the troughs stand bottles, each containing the amount of glycerine required for the acid in one pitcher, and each having a rubber siphon-tube with a glass tip, through which the glycerine is drawn over, dropping into the pitcher below. The filled pitchers stand in ice-water for some hours before the operation begins, and while it is going on, the current of compressed air forced into the acid liquid keeps it in constant agitation. After the glycerine has run over, the pitchers are emptied into a large volume of water for the precipitation of the nitro-glycerine, which is then washed by agitation with water (and alkaline solution) and a stream of compressed air.

Boutmy and Faucher's Method.—The glycerine is mixed with sulphuric acid (forming glycero-sulphuric or sulpho-glyceric acid), and this mixture is added to the mixed acid, the whole being allowed to stand 24 hours. The quantities used are mixed together at once, and time is allowed for the completion of the action.

Kurtz's Method.—The acid is contained in a narrow vertical cylinder of lead or iron with conical bottom. Two pipes reach to the bottom of the cylinder, one bringing glycerine and the other compressed air. These pipes have small orifices, and are so placed that the stream of air strikes the glycerine and mixes it rapidly with the acid. The nitro-glycerine formed rises to the surface of the acid, either running off steadily, or drawn off at intervals, through a pipe to the washers. These are placed one above another, so that the nitro-glycerine coming in at the top of one runs out at its bottom to the one below, and so on, a stream of compressed air agitating the water in each. The converting vessel and the various washers can be separated by heavy walls. In the latest form of Kurtz's apparatus, the glycerine is converted into a sort of emulsion by forcing air into it, and this emulsion is blown through a pipe leading to the bottom of the converting vessel by a stream of compressed air. Thus a more rapid and perfect mixture of the glycerine and acid is obtained.

The methods above mentioned are the most important and characteristic ones. Nobel's is the one most used. The apparatus is simple and effective for work on a large scale, and the conversion can be rapidly performed. As in all processes, care must be taken to avoid rise of temperature, but trouble on this score is less liable to occur when operating with large quantities. Mowbray's method involves the use of many vessels, and much handling of small quantities of material, and therefore requires more labor and time, but, with proper care and attention, it is a good working method. Boutmy and Faucher's process, it is claimed, is more free from danger, and gives a larger yield than others, but these claims do not seem to be borne out in practice. The mere process of conversion is practically free from danger, accidents at this stage being extremely rare by any method. A yield of 1.8 parts of nitro-glycerine to 1 of glycerine is claimed for this mode of operating, but this is no better, if as good, as is regularly obtained at the present time by the other plans, and Kurtz asserts that 2.2 to 1 is attainable by his. The peculiarity of this process lies in the previous union of the glycerine with sulphuric acid, so that the heat given off during conversion is less, and the reacting masses can be mixed together at once and not slowly. However, the heat evolved during conversion by the other ways is perfectly controllable without loss of time, while for this process a period of 24 hours is allowed for action, a serious delay and objectionable as leaving the nitro-glycerine, as it is formed, exposed to the action of strong acid for a long time. Kurtz's method is the newest one, and seems to possess some advantages. The action goes on rapidly, and the nitro-glycerine, as fast as it is produced, is removed, and not allowed to collect in the converter or at any time during the operation, thus lessening the chances of extensive explosion, and the nitro-glycerine is not exposed to further action. The difficulty with it in its present shape seems to be that the acid will soon become weakened, when the operation must be stopped to supply fresh acid, or the product will be inferior. But the weakened acid drawn off can be worked up again, and not thrown away, as in other methods,—a considerable economy. The converting vessel must be high enough to insure sufficient exposure of the glycerine to the action of the acid. When this has been attained, it is desirable to remove the nitro-glycerine at once, and this Kurtz's plan permits. It is interesting as the first, though imperfect, attempt at a continuous process, and it promises

to be much used. However, the time is probably not far distant when a really continuous method will be practiced.

Composition and Properties.—There are three possible nitrins or nitro-glycerines, mononitrin, $C_3H_7(NO_2)O_3$, dinitrin, $C_3H_6(NO_2)_2O_3$, and trinitrin, $C_3H_5(NO_2)_3O_3$. The characteristics and conditions of formation of these compounds have not been fully worked out. Probably, as in analogous cases, the two lower ones (mono- and di-) are formed to a greater or less extent when weak acid is used, or the temperature of the reaction is too high, and that trinitrin is the only or principal one formed when proper care is taken. It is usual, therefore, to consider nitro-glycerine as trinitrin, and to give its empirical formula as $C_3H_5N_3O_9$. The equation illustrating its formation will then be—

$$\underset{\text{Glycerine.}}{C_3H_8O_3} + \underset{\text{Nitric acid.}}{3HNO_3} = \underset{\text{Nitro-glycerine.}}{C_3H_5N_3O_9} + \underset{\text{Water.}}{3H_2O}.$$

Nitro-glycerine is a colorless, oily liquid at ordinary temperatures, sp. gr. 1.6, insoluble in water, and having a pungent, aromatic taste. At 40° F., it freezes to a white, crystalline mass. It produces a violent temporary headache if taken into the system, either by placing a drop upon the tongue or on the skin. Persons handling it constantly quickly lose their susceptibility to this action. Pure, well-made nitro-glycerine is stable (does not spontaneously decompose) under ordinary circumstances; if it contains free acid, decomposition is apt to occur which may result in explosion or in the attainment of a state of extreme sensitiveness, so that accidental explosion may be easily caused. Pure nitro-glycerine is not sensitive to friction or moderate percussion, when freely exposed. Placed on an anvil and struck with a hammer, only the particle receiving the blow goes off, scattering the remainder. Completely confined, it may be readily exploded by a blow. Nitro-glycerine may be inflamed and burns slowly. Its firing-point is about 180° C. (356° F.).

Use and Mode of Firing.—Nitro-glycerine is the most powerful explosive agent in use. In its liquid form it is inconvenient and dangerous to handle or transport, so it is not usually employed in that state. It is liable to loss or scattering through leakage of the vessels containing it, which may later give rise to accidents. It may be frozen, and as long as it remains frozen, its transportation is easy and safe, but it must be thawed before using. Thawing is performed by placing the cans containing the explosive in water, at not over 100° F.

The mode of firing is a fuze charged with fulminating mercury, which with certainty accomplishes the detonation of nitro-glycerine. With a gunpowder fuze it is fired with difficulty, and only imperfectly. Frozen nitro-glycerine is less readily and certainly fired than the liquid, even by a fulminate fuze. Since nitro-glycerine is readily detonated, strong confinement is not needed for it.

Products of Decomposition. — On explosion, nitro-glycerine is resolved into gases,—carbonic acid gas, water (steam), nitrogen, and a small proportion of oxygen (Nobel). If the explosion is imperfect, oxides of nitrogen and other bodies are formed.

Nitro-glycerine Preparations. — In order to avoid the disadvantages of the liquid condition, nitro-glycerine may be mixed with various substances (absorbents) to form solid or semi-solid preparations. For most purposes, also, the great intensity of the pure nitro-glycerine explosion is not demanded, while yet a violent explosive is wanted. Therefore preparations containing various proportions of nitro-glycerine find very extensive application as blasting agents, as their cost is moderate, and they are very effective.

Some writers divide the nitro-glycerine preparations into those with an active base and those with an inactive base. Preparations with an active base are those in which the absorbent substance or substances are explosive, so that they take part in the explosion, adding to the force exerted. Nitro-glycerine mixed with gunpowder would give a preparation which would be said to have an active base. Preparations with inactive base are those in which the absorbent is an inert substance, like the earth from which dynamite is made. This classification is unsatisfactory, for, though there are preparations in which the other substances do act with the nitro-glycerine, others are included with them in which such joint action does not occur. It must be remembered, however, that the intermixture of different substances with nitro-glycerine will doubtless affect its explosion, though they do not take part in it.

Dynamite. — The word dynamite is used, to some extent, as a generic term, and it is then made to include all of the mixtures of nitro-glycerine with solid substances. Originally, it applied to one particular preparation, and it is still most used in this sense. This preparation is largely employed for military purposes under the name of dynamite, and in this article it will be the one referred to when that name is used. Dynamite is prepared by mixing nitro-glycerine with a natural silicious earth (kieselguhr), which abounds in many localities. This earth is an extremely fine powder, composed of the skeletons of infusoria. It has high absorptive power, being capable of taking up from 3 to 4 times its weight of nitro-glycerine without becoming pasty. The usual proportions are 1 part of earth to 3 of nitro-glycerine. This gives a soft material, resembling in consistency slightly moist pale brown sugar. Shaken down in a cartridge or case, it has about .9 sp. gr., but may be packed or driven to a sp. gr. of 1.25. From its nearly solid, soft and pulverulent condition, it is much easier and safer to handle than liquid nitro-glycerine, and, at the same time, it contains so large a proportion of that agent that it is a very powerful explosive. It is fired, like nitro-glycerine, by a detonating fuze containing fulminating mercury. Dynamite freezes at the same temperature as its nitro-glycerine, to a more or less compact mass, and when frozen its explosion is accomplished with difficulty, and not with certainty, by a fulminate fuze.

The absorbent capacity of the earth must not be exceeded in preparing the dynamite, in order that exudation may not afterward occur. If flame is applied to dynamite, it takes fire and burns with a strong flame, leaving as residue the silicious earth. If dynamite in large quantity is set on fire, explosion may occur after a part has burned away, but in moderate quantity and not closely confined, inflammation only takes

place. Dynamite is little liable to explosion from sparks, in which respect it is much safer than ordinary gunpowder. Although wetting does not prevent the explosion of dynamite, yet if it is exposed to the prolonged action of water in quantity, the nitro-glycerine will be washed off the particles of silica more or less completely.

Dynamite is sold in the United States under the name of Giant Powder No. 1.

Cellulose Dynamite.—Proposed by Trauzl, an Austrian engineer officer. The absorbent is purified wood-pulp which will take up 3 times its weight of nitro-glycerine. This preparation is said to be capable of resisting the action of water, and that if 20 per cent. of water be added to it, it is still perfectly explosive by a fulminate fuze, although it cannot be inflamed.

Gun-cotton Dynamite.—Glyoxiline.—The first-named is a preparation also brought forward by Trauzl, and is a mixture of damp gun-cotton with nitro-glycerine. Glyoxiline has been made by Abel by allowing the porous masses of compressed gun-cotton to absorb nitro-glycerine.

Explosive Gelatine, or *Gelatine Dynamite.*—This new and very interesting preparation was discovered by Nobel. He found that nitro-glycerine would dissolve the nitro-cellulose known as photographic gun-cotton or collodion cotton, with the production of a gummy or gelatinous substance, in which the nitro-glycerine is very strongly held, and which has very great explosive power. Explosive gelatine may be prepared in two ways: 1. By using a solvent for the nitro-cellulose and mixing the solution with nitro-glycerine. For this purpose methyl alcohol, or the usual mixture of ether and alcohol, may be used. Afterwards the solvent must be removed by evaporation. This operation may be conducted in the cold, but practically it is less serviceable than—2. By dissolving the nitro-cellulose directly in the nitro-glycerine at a moderate heat. A convenient mode of working is to heat the nitro-glycerine in porcelain or enameled vessels of convenient size, standing in a water-bath to about 170° F., adding the required quantity of soluble gun-cotton to the liquid as soon as it has become hot. The mixture should be frequently stirred. Gelatinization takes place quickly, and as soon as it is complete the vessels should be removed from the bath. On cooling, there is obtained a firm jelly free from greasiness. The proportion of soluble gun-cotton used varies from 6 to 10 per cent. of the finished material, depending somewhat upon its solubility. The gelatine has a pale-yellow or yellowish-brown color, is elastic, and can easily be cut or rolled into convenient shapes. It is quite insensitive to blows or friction, and does not give up its nitro-glycerine under action of pressure or of water. An especially powerful fuze is required to explode it when unconfined.

Other preparations may be made by mixing various substances with this gelatine. Of these, camphorated gelatine is the most important. It differs from the simple gelatine in that it contains a small percentage of camphor. This may be conveniently added when the gelatine is made, as camphor is very easily soluble in nitro-glycerine. This camphorated gelatine is extremely insensitive to blows. The impact of a rifle-bullet fired from a distance of 80 feet fails to fire it. It is not affected by water or any temperature attained in practice. Its explosion requires a peculiarly strong fuze, unless it is very strongly confined. Hess states that the Austrian camphorated gelatine (4 per cent. of camphor) is for equal weights 25 per cent. stronger than dynamite or compressed wet gun-cotton, and for equal bulks has 40 per cent. advantage in strength over the dynamite and 75 per cent. over gun-cotton. In many respects, therefore, explosive gelatine seems to be peculiarly suitable for military purposes.

Other Preparations.—Many other nitro-glycerine mixtures are made for use in blasting, which are not very suitable for military service, and need not be discussed here. They contain usually from 20 to 50 per cent. of nitro-glycerine, mixed with various absorbents, ordinarily the ingredients of gunpowder or similar substances. Of these may be mentioned, as used in the United States, Dualin, Giant Powder No. 2, Hercules Powder (contains magnesium carbonate), Rendrock, Vulcan Powder, etc.; in Europe, Dynamite No. 2, Lithofracteur, Lignose, Colonia Powder, Brains Powder (contains a chlorate), etc.

GUN-COTTON.—*Syn.* Nitro-cellulose; Pyroxylin.

Schönbein, in 1845, stated that he had prepared an explosive substance from cotton. He kept his process secret until it had been discovered also by Böttger, Otto, Knopp, and Taylor. In France, England, Germany, and Russia, attempts were made to manufacture and use the new agent, but not with satisfactory results. By the method of manufacture employed, the liability to spontaneous decomposition was not removed, and consequently many accidents were experienced with it. In Austria, the use of gun-cotton was kept up for a number of years after it had been given up by other governments. This was due to the improvements in the methods of making, which were devised by Von Lenk, an Austrian officer. It was employed in shells and in field-guns. While it was found to be a very serviceable agent, yet its dangerous instability still gave trouble, and after a severe accident in 1862, its manufacture was largely given up, its use being limited to certain engineering purposes, and in 1865 its making was stopped altogether in Austria. In 1865, Abel introduced his process by which the quality of the gun-cotton was so much improved that the previous obstacles to its extensive use seemed to have been altogether removed. It therefore grew in favor, until the severe accident at Stowmarket, England, in August, 1871. Investigation into the causes of the accident showed that the explosion was not due to any defect in the method of preparation of the gun-cotton, or to its instability, so that confidence was again felt in it. Afterward, it was discovered that Abel's compressed gun-cotton could be violently exploded when wetted, or even saturated, with water. In this way was obtained an explosive agent of great power, as well as one having a high degree of safety. In consequence, compressed gun-cotton has been largely adopted by European governments as a military explosive, particularly for torpedo purposes. It possesses many advantages for such employment, but for blasting the nitro-glycerine

preparations are preferred, as more convenient to use and more easily exploded.

Formation and Mode of Manufacture.—Gun-cotton is formed by the action of concentrated nitric acid on cotton or cellulose. Cotton being nearly pure cellulose is the best material for this purpose. The method of making consists essentially in exposing the cotton for a sufficiently long time to the action of a mixture of strong nitric and sulphuric acids, and in thoroughly washing the product. As in the nitro-glycerine reaction, the sulphuric acid does not take any direct part in the formation of the gun-cotton, but takes up the water, which is a by-product.

Abel's Process.—Cotton-waste is the form of cotton used. It is picked, cleaned, and dried. The acids are the strongest nitric and sulphuric acids, mixed in the proportion of one part of the former to three of the latter. Cotton in one-pound charges is immersed in the acid mixture, which is contained in a trough surrounded with cold water. After a short exposure to the action of the acid, the cotton is taken up, placed upon a perforated shelf, and as much as possible of the acid squeezed out from it. It is then put into jars, covered with fresh acid, and the jars placed in cold water, where they remain for 24 hours. The gun-cotton from the jars is thrown into a centrifugal strainer, which expels from it nearly all of the acid. It is then diffused quickly in small quantities through a large volume of water, and again passed through a centrifugal machine. Thorough washing is necessary to remove the traces of acid still adhering to the gun-cotton. The washing is expedited and rendered complete by the operation of pulping. The pulping is performed in pulping-engines, or beaters. A beater is an oblong tub, in which is placed a revolving wheel carrying strips of steel on its circumference. From the bottom, under the wheel, project similar steel strips. By the rotation of the wheel, the gun-cotton suspended in water circulates around the tub, and is drawn between the two sets of steel projections, which reduce it to a pulp. The bottom is movable, so that the space through which the gun-cotton must pass may be contracted as the operation goes on. When the pulping is complete, the contents are run into the poachers for the final washing. A poacher is a large, oblong wooden tub. At the middle of one side is placed a wooden paddle-wheel, which extends half-way across the tub. In the poacher, the pulp is stirred for a long time with a large quantity of water. The revolution of the wheel keeps up a constant circulation, and care is taken that no deposit occurs in any part of the tub.

The pulp is next to be separated from the large volume of water in which it is suspended, and compressed into cakes or disks. This is accomplished in two presses. The first press has thirty-six hollow cylinders, in which perforated plungers work upwards. The plungers having been drawn down, the cylinders are filled with the mixture of pulp and water, and their tops covered with a weight. The plungers are then forced up by hydraulic power. The pulp is compressed, the water escaping through the perforations in the plungers.

In the second press, the cylindrical masses of gun-cotton from the first press are more highly compressed, a pressure of six tons to the inch being applied.

About 6 per cent. of water remains in the cakes, which is usually increased to 20 or 25 per cent. before storing the material. A variety called granulated gun-cotton is prepared without pressing, by making the pulp into small grains or balls.

In this process, while care is taken to insure complete conversion, still the essential feature is the thorough washing accomplished. This is rendered possible by the pulping operation by which the fibres are torn into shreds, thus facilitating their rapid, as well as thorough, purification.

Composition and Properties.—There are a number of varieties of nitro-cellulose. Of these only one is used as an explosive agent. It is derived from the fullest action of the nitric acid upon the cellulose. The others are less explosive, although very inflammable. Some of the less nitrated products are largely used for making collodion for photographic and medical purposes, for celluloid, etc. The composition of the explosive gun-cotton, or tri-nitro-cellulose, may be expressed by the formula $C_6H_7N_3O_{11}$, and the equation illustrating its formation will be—

$$\underset{\text{Cellulose.}}{C_6H_{10}O_5} + \underset{\text{Nitric acid.}}{3HNO_3} = \underset{\text{Tri-nitro-cellulose, or Gun-cotton.}}{C_6H_7(NO_2)_3O_5} + \underset{\text{Water.}}{3H_2O}.$$

The appearance of the cotton is very little changed, by the operation of conversion. Gun-cotton is insoluble in and unaffected by water. If flame is applied to dry, loose gun-cotton, it flashes off; dry compressed gun-cotton burns rapidly but quietly if unconfined, and moist compressed gun-cotton slowly, under the same circumstances. If a large quantity of compressed gun-cotton is inflamed, the explosion of a part may be produced after the remainder has burned away. The outer portion confines the inner, and it becomes heated to the point of explosion. Dry, loose gun-cotton is not detonated by fulminating mercury, but if packed in small compass, and especially if highly compressed, the violent explosion is readily produced. Fulminate will not explode wet, compressed gun-cotton. To accomplish this there is required the detonation of a small quantity of dry, compressed gun-cotton, itself detonated by a fulminate. Gun-cotton is not sensitive to friction or percussion. Well-made and thoroughly washed gun-cotton is stable, but if free acid has been allowed to remain in it, or if it is contaminated by the lower products, spontaneous decomposition may result. The firing-point of gun-cotton is about 360° F.

Use and Mode of Firing.—Gun-cotton was formerly used for artillery by spinning and weaving the fibre into ropes or webs, from which cartridges were made. At the present time the compressed is the only kind made, and this is, of course, not suited for artillery. Compressed gun-cotton is usually made in disks from 1 to 6 inches diameter, but any other shape can be as easily made. For torpedo purposes, it is pressed into forms which will fit the cases to contain it.

Compressed gun-cotton is always stored and used wet. It is then the safest explosive agent known. In order to explode it when in this

condition, a special "primer" is necessary, which is composed of dry compressed gun-cotton with a fuze charged with 25 grains of fulminating mercury firmly attached to it. This primer must be water-proof, although the main charge may be freely exposed to water.

Gun-cotton, either as pulp or compressed, is well fitted for bursting charges for shells.

Products of Decomposition.—On explosion, gun-cotton is almost entirely converted into gases, only a trifling residue being left. The gases formed are carbonic acid, carbonic oxide, water (converted into steam by the heat of the reaction), nitrogen, and a small amount of marsh gas (Karolyi).

The combustion is not so complete as when nitro-glycerine is fired. The latter contains more than oxygen enough to oxidize all its carbon and hydrogen to carbonic acid and water, while the quantity in gun-cotton is insufficient to do this, and a considerable proportion of carbonic oxide is formed. This does not much affect the volume of gas formed, but the heat evolved is considerably less than if the oxidation of the carbon was more complete.

Gun-cotton Preparations.—Nitrated Gun-cotton.—This is made by soaking the dry compressed gun-cotton in a saturated solution of saltpetre (potassium nitrate), and drying.

Chlorated Gun-cotton.—This is similarly made, using potassium chlorate instead of nitrate.

Tonite, or *Cotton Powder.*—This is a mixture of finely divided gun-cotton with barium nitrate.

THE FULMINATES.—The fulminates are salts of fulminic acid ($C_2H_2N_2O_2$). The mercury salt is the only one of practical value. All of them are easily exploded, and some are excessively sensitive.

Fulminating Mercury.—Fulminating mercury has the composition indicated by the formula $C_2HgN_2O_2$. It is formed by the action of mercuric nitrate and nitric acid upon alcohol. The best mode of preparing it is as follows:

Dissolve 1 part of mercury in 12 parts of nitric acid, sp. gr. 1.3, and pour this solution into 11 parts of alcohol, 85 per cent. Place the vessel containing the mixture in hot water until it darkens and becomes turbid, and begins to evolve dense white fumes. It is then removed from the water. The reaction goes on, with strong effervescence and copious evolution of dense, white, ethereal vapors. If red fumes appear, cold alcohol should be added to check the violence of the action. The operation should be performed at a distance from a fire or flame, and in a strong draft, so that the vapors will be carried away. When the liquid clears and the dense white fumes are no longer given off, further action is stopped by filling up with cold water.

The fulminate settles to the bottom of the vessel as a gray, crystalline precipitate. The supernatant liquid is then poured off, and the fulminate washed several times by decantation or upon a filter.

Properties and Uses.—Dry fulminating mercury explodes violently when forcibly struck, when heated to 186° C. (367° F.), when touched with strong sulphuric acid or nitric acid, by sparks from flint and steel or the electric spark.

When wet it is inexplosive. It is therefore always kept wet, and dried in small amounts when wanted for use.

Its explosive force is not much greater than that of gunpowder, but it is much more sudden in its action, so that it produces violent local effects.

The readiness with which it may be fired makes it an excellent means of causing the explosion of other substances, and it is for this purpose only that it is used. It finds many applications,—either pure or mixed with other bodies,—in percussion-powder, percussion-caps, primers, fuzes, detonators, etc. It presents many advantages for this use. It is of special importance for the peculiar power it possesses of causing the violent explosions called detonations. It is, therefore, a requisite for exploding nitro-glycerine, gun-cotton, and their preparations.

Detonators or detonating fuzes are charged with pure fulminating mercury,—15 to 25 grains in each. Fifteen grains is a sufficient charge for nitro-glycerine or its preparations; one of 25 grains is used with compressed gun-cotton.

Fulminating Silver.—This salt has a similar composition to, and is prepared like, fulminating mercury, using silver nitrate instead of mercuric nitrate. It must be handled with the greatest caution, as it is extremely sensitive, exploding when dry on slight provocation and even when wet, although then requiring a harder blow than if dry.

THE PICRATES.—The picrates are salts of picric acid. Picric or trinitrophenic acid is formed by the action of nitric acid on carbolic acid (phenol, C_6H_6O). Three products may be derived from this action, but only one, picric acid, possesses any marked explosive properties.

Picric acid has the composition indicated by its formula,—$C_6H_3(NO_2)_3O$, or $C_6H_3N_3O_7$. Picric acid is found in commerce, being used to dye silk and wool yellow. If the acid is heated, it takes fire and burns sharply and rapidly, without explosion. The picrates are all exploded with more or less violence by heat or blows. When used as explosive agents, they are mixed with potassium nitrate (saltpetre) or potassium chlorate.

A large number of picrates are known, but the potassium and ammonium salts are the only ones that have been much used in explosive preparations.

Potassium Picrate. $C_6H_2KN_3O_7$.—Most violently explosive of the picrates. Potassium picrate and potassium chlorate form a mixture nearly as powerful as nitro-glycerine, but it is so sensitive to friction or percussion as to render it practically useless. With potassium nitrate instead of chlorate, a less violent mixture is obtained, but one still too liable to accidental explosion.

Ammonium Picrate. $C_6H_2(NH_4)N_3O_7$.—This salt has been employed by Brugére and by Abel with saltpetre in the preparation of certain explosive mixtures. Brugére claims for such a powder, that it is less hygroscopic than gunpowder, and that it is more powerful and more uniform in its effects.

Abel's Picric Powder has been used in England for bursting charges for shells. It is prepared by the usual gunpowder processes, and has the same form as that agent. It is not affected by blows or friction, and is as safe and perma-

nent as gunpowder, and is fired in the same way.

A good powder may be made from ammonium picrate, saltpetre, and a small proportion of charcoal. The charcoal serves to bind together the other ingredients, and there is obtained a mixture which can be easily incorporated, pressed, and granulated. Experiment with this powder has shown that it may be serviceable as a substitute for gunpowder, when greater violence is wanted, and neither gun-cotton nor nitro-glycerine is available or suitable. It is handled and fired like ordinary gunpowder, and does not absorb moisture more readily.

EXPLOSIVE MIXTURES.—The general composition of these explosive agents has been already considered. Many of them contain a nitrate or nitrates, in most cases potassium or sodium nitrate or both. These salts are mixed with combustible substances in varying proportions, according to the use for which the explosives are wanted. From charcoal, sulphur, and potassium (or sodium) nitrate are prepared the numerous varieties of war, sporting, and blasting powders. They are essentially alike in their mode of action, and may all be included under the general title of gunpowder. The explosive mixtures which are not classed under gunpowder are of but comparatively little importance and require but brief mention.

Schultze's Powder is made by converting purified woody fibre (sawdust) into nitro-cellulose, by treatment with nitric and sulphuric acids, washing, drying, and mixing with saltpetre by soaking the grains in a saturated solution of the salt, and again drying. It is intended for use in small-arms. A similar powder is made in the United States by Dittmar, for sporting purposes.

Barium nitrate has been occasionally used to replace saltpetre, as in the preparations called Saxifragin and Wynant's Powder, but with no especial success.

Mixtures containing potassium chlorate form a separate class. They are characterized by great readiness and sharpness of explosion. They are sensitive to blows or friction, so much so that they are of but little value as explosive agents. The principal preparations of this kind are—

German, or *White Gunpowder*, *Reveley's Powder*.—Potassium chlorate with potassium ferrocyanide (yellow prussiate of potash), or with sugar as a third ingredient.

Horsley's Powder.—Potassium chlorate and powdered nut-galls. When this powder is used as an absorbent for nitro-glycerine, the mixture resulting is called Horsley's Powder No. 2.

Erhardt's Powder.—Potassium chlorate and tannin with powdered coal, sometimes used as a diluent.

Powder used in "chemical fuzes."—Potassium chlorate and sugar, or sugar and nut-galls.

Oriental Powder.—Potassium chlorate and powdered gambier.

Pertuiset Powder.—Potassium chlorate and sulphur. Used in explosive bullets.

Sprengel's Nitric Acid and *Potassium Chlorate Mixtures*.—Sprengel has found that there are many organic substances which dissolve in concentrated nitric acid, forming explosive mixtures. Nitro-benzole, or picric acid, will give a liquid which can be violently exploded. These solutions contain strong nitric acid, so that they are inconvenient to handle or use.

He also proposes a kind of chlorate mixture which avoids the usual dangers of such preparations. The mixing of potassium chlorate with solid combustible substances (the usual method) is a dangerous operation, and the mixture is very sensitive. Sprengel allows cakes or lumps of the chlorate to absorb combustible liquids, which is readily done without danger. If the liquid taken up contains a nitro-compound, or one containing sulphur, the mixture can be exploded by a fulminate; but if not, then the detonator must be surrounded by an envelope of gun-cotton. Carbon disulphide, nitro-benzole, benzine, petroleum, are examples of combustible liquids which may be used in this way. Sprengel claims for these mixtures cheapness, power, and safety.—*Walter N. Hill.* See GUNPOWDER.

Export. To send goods out of a country.

EXPORTS. Goods sent out of a country. See BALANCE OF TRADE, COMMERCE, CUSTOMS.

Extreme Breadth. The widest part of the ship, including the thickness of the planking.

Eye. A loop or ring. The *eye* of a shroud is that part that goes over the mast-head. The *eye* of an anchor is the hole in which the ring is inserted. *Eyes of a ship*, or the *eyes of her*, the hawse-holes; they were formerly frequently painted to represent eyes; the Chinese always paint an eye on each bow of their craft. The term is also applied to those parts of a ship which lie near the hawse-hole, particularly in the lower apartments within the vessel.

EYE, ARTIFICIAL, or SPINDLE. A neat eye for the end of a stay, and sometimes used for the lower end of man-ropes.

EYE-BOLT. A bolt with an opening in the head to which a tackle may be hooked.

EYE, FLEMISH. An eye used for the collar of a stay. It is not strong, soon rots, and is seldom used where strength is more important than neatness. The name is sometimes applied to the artificial eye.

EYELET-HOLES. Small circular holes in a sail through which are thrust the reef-points, robands, etc.

EYE, ROPE-MAKER'S. An eye formed in the end of a cable in laying it up. Two of the strands are two legs of a rope, and when laid up they form an eye; the third strand is then also formed into an eye.

EYES, LASHING. Eyes formed in two parts of a strap of a block, or in end of a stay, which are connected by a lashing.

EYE-SORE. Any disagreeable object.

EYE-SPLICE. A kind of splice made by turning the end of a rope back and passing the ends of the strand through the standing part. The *eye of a splice*, the strand raised up by the marlinspike to receive the opposite strand.

Eyght. An alluvian river-island; called also *ait*, *ayt*, *ey*, *eyet*, or *eyot*.

F.

F. Of the letters used in the log-book to indicate the state of the weather, *f* denotes *fog*.

Face. A flat surface; as, the face of the muzzle, face of a valve, etc. To trim the cuffs, collar, etc., of a garment with a protective or ornamental covering.

Face-piece. The letting of one piece, which is thinner, into another in order to strengthen it.

Formerly, it was a term used in making the knee which formed the cut-water of the ship, and was defined as a piece of oak generally tabled into the forepart of the knee of the head, to assist in the conversion of the main piece, and likewise to shorten the upper bolts, and prevent the cables from rubbing against them as the knee gets worn.

Facing. A piece of cloth sewed on a garment as a protection or ornament.

Factor. An agent, transacting business for others, and empowered to buy and sell at his own discretion.

Factorage. The allowance, percentage, or commission paid to a factor.

Factory. A house or quarter where factors reside. The body of factors in a country. A manufactory, mill, or workshop.

Faculæ. The bright streaks on the sun's disk, in which appear the *maculæ* or dark spots.

Fadome. Old form of *fathom*.

Faff. To blow in puffs.

Fag. To beat. *To fag out*, to untwist or become frayed; as, the end of a rope, or the edge of canvas.

Fag-end. The frayed end of a rope. The small remaining part of anything.

Faggot. A man hired to answer to names in a false muster.

Fagot. A billet of wood used in stowing cargo.

Fahrenheit, Gabriel Daniel. The inventor of the mercurial thermometer. He was born in Dantzic in 1686. In 1714 he conceived the idea of substituting mercury for spirits of wine in the construction of thermometers. He took as the zero of his thermometric scale the lowest temperature observed by him at Dantzic, in the year 1709, which he found was that produced by mixing equal quantities of snow and sal-ammoniac, and which he probably supposed was the absolute zero of temperature. The space between this point and that to which the mercury rose at the temperature of pure boiling water he divided into 212 parts or degrees. This scale, though now in common use, will eventually be superseded by the centigrade scale of Celsius. It is denoted by the abbreviation "F." or "Fahr."

Faik, or Falk. A name for the razor-bill (*Alca torda*).

Fair. Plain; favorable; unobstructed. Applied to the weather, clear or cloudless; to the wind, favorable or propitious; to timbers, when they are trimmed to fit exactly.

Fair Curve. In delineating ships is a perfectly fair line applied to any portion of the ship's surface.

Fairing. In ship-building is making a curved surface on any part of a ship perfectly true, or parts of perfect arcs.

Fair Lead. A rope has a fair lead when it does not suffer chafe from obstruction.

Fair-leader. A block or thimble of wood or metal, placed to give a rope a fair lead, or to change its direction slightly. Fair-leaders are generally made of hard wood, as lignum-vitæ, and have one, two, or three holes in them, according to the number of ropes to lead through them. One or two scores are cut in one side for the shroud or stay which they are to embrace, and two smaller scores at right angles to these for the seizings to hold them in place. Also, a board or rail with holes through which ropes lead.

Fair Plate. Has reference to the plating of iron ships, and is a term used when the plate has been finished in perfectly fair or evenly true lines.

Fair-way. The middle of the navigable channel of a river, strait, or harbor, etc. The proper course through a channel.

Fair Weather. Weather in which the light sails may be carried.

Fair-weather Friend. A friend when fortune smiles, but who deserts you in the days of adversity.

Fair-weather Sailor. The nautical equivalent of *carpet-knight*.

Fairfax, D. M., Rear-Admiral U.S.N. Born in Virginia. Appointed midshipman from North Carolina, August 12, 1837; sloop "John Adams," East Indies, 1837–40; at the destroying of towns on the west coast of Sumatra, in 1839; ten months in sloop "Fairfield" and frigate "Brandywine," Mediterranean, in 1841–42; Naval School at Philadelphia, 1842–43.

Promoted to passed midshipman, June 29, 1843; attached to steam-frigate "Missouri" until she was destroyed by fire at Gibraltar, in 1843; coast survey, in 1844; brig "Porpoise," 1845; transferred, after four months, to frigate "Columbus," East India and Pacific Squadron, 1845–47; in store-ship "Erie," Pacific Squadron, for four months, and transferred to sloop "Cyane," 1847–49; at the attack and capture of several towns on the west coast of Mexico, under Commander Dupont; frigate "Congress," Brazil Squadron, 1850–53.

Commissioned as lieutenant, February 26, 1851; frigate "Potomac," Home Squadron, 1855–56; transferred to frigate "Wabash," and continued in her during 1856–58; at capture of Walker's expedition, at San Juan, Nicaragua; steamer "Mystic," in 1859; "Constellation,"

1859–60; "San Jacinto," 1860–61, coast of Africa; while in the last named, directed in person the taking from the "Trent" of Messrs. Mason and Slidell; commanding steamer "Cayuga," Mississippi Squadron, in 1862, under Admiral Farragut; skirmishing along its banks and keeping river open as far as Red River.

Commissioned as commander, July 16, 1862; commanding monitor "Nantucket," South Atlantic Blockading Squadron; attack on Charleston forts, April 7, 1863; commanding "Montauk," in night and day work at Charleston, until August 25, 1863; commandant of midshipmen, at the Naval Academy, 1863–65; commanding Practice Squadron, two seasons.

Commissioned as captain, July 26, 1866; commanding steamer "Rhode Island," flag-ship North Atlantic Squadron, 1866; commanding flag-ship "Susquehanna," same squadron, 1867–68; on ordnance duty at different periods, at Philadelphia, New York, and Boston; executive-officer of navy-yard, Portsmouth, N. H., 1870–72.

Commissioned as commodore, August 24, 1873; commanding Naval Station, New London, Conn., 1873–76; special duty, 1876–77; commandant Naval Station, New London, 1877–78. Total sea-service 22 years and 4 months; shore duty, 15 years. Special duty Washington, D. C., 1879. Governor Naval Asylum, Philadelphia, 1880. Commissioned as rear-admiral, July 11, 1880.

Fajardo. On the east coast of the island of Porto Rico, 5 miles S. of the N.E. angle of that island; has a fine harbor, telegraph-lines to other West Indian ports and the United States. Pop. 3500.

Fake. One complete circle of a rope in a coil. A number of such turns make a *tier* or *sheave*, and several tiers superimposed, a *coil*. *To fake* a rope is to coil it down carefully, in opposition to *coil*, to perform the work loosely or hastily. See FLEMISH, FRENCH-FAKE.

Falcon. An ancient and mediæval gun. There were various sizes, throwing balls of from 1 to 6 pounds. They were about 25 or 30 times their calibre in length (7 to 8 feet).

FALCONET. A mediæval piece of ordnance having a ball of ½ to 3½ pounds smaller in calibre than a falcon.

Falconer, William, was born in Edinburgh about 1730. He went early to sea, and before he was 18 years of age was second mate of a vessel in the Levant trade, which was wrecked off Cape Colonna, himself and two others being the only portion of the crew saved. He published "The Shipwreck" in 1762, and during the next year he entered the navy as midshipman in the "Royal George." When peace came he resided in London, where he wrote a satire on Wilkes, and compiled a "Nautical Dictionary." He was again at sea in September, 1769, as purser in the "Aurora" frigate, and perished with his companions when the vessel sank in the Mozambique Channel.

Fall. To descend by the force of gravity. To lessen; to diminish. To happen; to come to pass. A precipitous descent of water. A break in a deck. The rope of a tackle or purchase. The ebb of the tide. *To fall aboard of*, to come into collision with another vessel, either by design or by the mismanagement of the vessel. *To fall astern*, to drop behind. *To fall back*, to give way; to recede. *To fall calm*, to become calm. *To fall down*, to sail or drift down to another position. *To fall foul of*, the same as *to fall aboard of*. *To fall in with*, to meet a vessel; to make the land. *To fall home*, to project within the perpendicular, said of the top-sides,—the same as *to tumble home*. *To fall off*, to pay off to leeward. *Fall not off!* Keep the ship up to her course! *To fall out*, the opposite of *to fall home* (which see).

FALLEN STAR. A name for the jelly-fish (*Medusa*), thrown up on a beach.

FALLING GLASS. The descending of the mercury in the barometer.

FALLING STAR. A shooting-star. See AEROLITES.

FALLING TIDE. The ebb-tide. See TIDE.

FALLS. The descent of a deck from a fair curve, lengthwise, to give height to a cabin, as in yachts, small sloops, and schooners.

FALL WIND. A sudden gust.

Fall! A Fall! A cry to signify that the harpoon has been firmly imbedded in the whale.

Fall Cloud. See CLOUD.

Fall River. A large manufacturing city and port of entry of Bristol Co., Mass., on the east bank of the Taunton River at its mouth, and on Mount Hope Bay, which is the northeastern arm of Narragansett Bay, 49 miles south of Boston, 19 miles N.N.E. of Newport, R. I. Large steam-packets ply daily between Fall River and New York. It is specially noted for its manufactures of cotton, for which there are 40 mills. The harbor is safe, capacious, and deep enough to admit vessels of the largest class. Pop. 44,500.

Falmouth. A seaport town on a branch of the estuary of the Fal, in Cornwall Co., England. Lat. 50° 8′ 8″ N.; lon. 5° 2′ 7″ W. The harbor is formed by the estuary of the Fal, and is about 5 miles long by 1 mile broad. The entrance is defended by Pendennis and St. Mawe's Castles, both built in the reign of Henry VIII., and the former contains large barracks, magazines, etc. Its position at the mouth of the English Channel rendered Falmouth for many years a principal station for the foreign mail service, and it is still a great resort for shipping. Pop. 5500.

False. Not genuine; feigned.

FALSE ALARM. See ALARM.

FALSE ATTACK. A feigned attack, to draw away the attention of the enemy.

FALSE COLORS. An ensign or colors other than that the vessel is entitled to carry. As a stratagem, the carrying of false colors is allowed; but no gun should be fired until the proper ensign is substituted.

FALSE FIRE. A composition in a wooden tube, which burned with a light blue flame from a half to several minutes. It was principally used as a night-signal, but often to deceive an enemy.

FALSE KEEL. A plank from 4 to 6 inches in thickness, which is put on and bolted to the main keel with short bolts, so that, in the event of the ship striking bottom, the false keel may be wrenched off without disturbing the main keel; it also enables the sailing ship to hold a better wind.

FALSE MUSTER. An incorrect statement of the number of people borne on the ship's books. A quaker or wooden gun.

False Papers. Documents carried by a ship declaring her to be what she is not, representing her cargo, destination, nation, etc., falsely, for the purpose of deceiving a searching-party. A vessel with false papers is a lawful prize.

False Post. A piece of timber tabled and secured to the after-side of the main post, to make good a deficiency in size.

False Rail. A rail fayed down upon the upper side of the main or upper rail of the head; it is to strengthen the head-rail.

False Stem. The same as the term fore-foot, the forward lower piece of the stem, and secured to the stem in a manner similar to the method of securing the false keel with short bolts.

False Stern. A stern built on the original ship or yacht, thereby altering its shape, without destroying the original vessel.

False Tabling. A tabling, or piece of canvas, sewed on the sides of a cut in an awning or screen.

False Point. A port of India, on the Bay of Bengal, Cuttack District. Lat. 20° 20′ N.; lon. 86° 47′ E. It has the best harbor between Calcutta and Bombay, safe, roomy, and accessible to all ships. It communicates by canals with the interior of Orissa.

Family-head. A figure-head composed of several full-length figures.

Fan. To widen.

Fanal (*Fr.*). A light-house.

Fancy-line. A line leading through a thimble in the mizzen rigging or top, and having another thimble near the end, through which the hauling part of the main brace leads, the end beyond being secured to the standing part of the brace. A line rove through a block at the jaws of a gaff, used to haul it down. A line used to overhaul a lee topping lift.

Fane. An old term for weather-cock. See Vane.

Fang. To prime a pump. The valve of a pump. The bend of a rope.

Fanion. A small flag used to mark the stations in surveying.

Fanning Along. Moving along very slowly with the sails alternately swelling and collapsing.

Fanning-breeze. A very light breeze, just sufficient to give a ship steerage-way.

Fan-tod. A name given to a nervous, fidgety officer.

Far-cost. A Scotch coasting-vessel.

Fardage. Dunnage, when laden in bulk.

Fare. Sum paid for conveyance by water. A fishing-seine for cod. A cargo of cod.

Faro. A seaport of Portugal, in Algarve, on the Valfermosa, near the south coast, 20 miles southwest of Tavira. Among the principal buildings are the military hospital, arsenal, and custom-house. Pop. 8210.

Farragut, David Glasgow, Admiral U.S.N., was born at Campbell's Station, near Knoxville, Tenn., July 5, 1801.

His father, who was descended from a distinguished family of the island of Minorca, emigrated to America, and entered the colonial army. He married in North Carolina and settled in Tennessee, but subsequently drifted to Louisiana, and entered the naval service as a sailing-master. Here an acquaintance arose between him and the celebrated Commodore David Porter, in whom young Farragut found a valuable friend.

He was appointed midshipman, December 17, 1810, served in the frigate "Essex" in her eventful cruise in the Pacific, and at the age of 13 was placed in command of one of her numerous prizes. In the battle between the "Essex" and the British ships "Phœbe" and "Cherub" (March 28, 1814), which resulted in the capture of the former, Farragut was slightly wounded, and received the commendation of his commander, who regretted that he was "too young for promotion." The story of the pig, which he tells in his journal, is not merely amusing, but suggests that some characteristics of the future commander were already pretty well developed in the boy. After the battle, a young reefer of the "Phœbe" was carrying off a pet pig, when Farragut claimed it as private property, and determined not to let it go. The oldsters cheered his pluck, made a ring, and declared that the winner of a fair fight should have the pig. This was quickly decided in favor of the young American, whose physical education had been exceptionally good. "So," says Farragut, "I took Master Murphy under my arm, feeling that I had in some degree wiped out the disgrace of our defeat."

With the remainder of the crew of the "Essex," he returned to the United States in the "Essex, Jr." (a captured whaler).

After peace was declared he received orders to the "Independence," 74, bearing the broad-pennant of Commodore Bainbridge, and intended to take part in the Algerine war; but Decatur succeeded in forcing the bey to terms before the ship's arrival in the Mediterranean.

Farragut made a second cruise to the Mediterranean in the "Washington," under Commodore Chauncey, and his journal of observations at this period of his career is extremely interesting. Through the interposition of the chaplain of his ship, Mr. Charles Folsom, who had been temporarily appointed consul at Tunis, Farragut had an opportunity to study and travel in the interior.

In 1823–24 he served under his old commander, Porter, in the Mosquito Fleet, fitted out for the suppression of piracy in the West Indies, took part in a small affair against the pirates at Cape Cruz, and had some romantic and ludicrous adventures in chasing them to their haunts on shore. He considered his experience in the Gulf as of great service to him professionally, and looked with pride upon the fact of his getting command of the schooner "Ferret" at the age of 22.

In January, 1825, he was attached to the "Brandywine," the vessel to which was assigned the duty of conveying Lafayette home to France after his visit and tour in the United States.

He served on the Brazilian station up to the close of 1837 as executive-officer of the "Delaware," and in command of the "Boxer" and "Decatur."

While in command of the sloop "Erie" at Vera Cruz he witnessed the bombardment of the castle of San Juan de Ulloa by the French naval forces (1838), and being always an enthusiastic observer of matters relating to his profession, he took notes of the action. At the breaking out of the war with Mexico (1846) he was

anxious to turn this experience to good advantage, remarking that in making his notes he had not looked forward to a war with Mexico, but had made it a rule of his life to note such things with a view to possible use in the future. After urgent solicitation he obtained command of the "Saratoga" (March, 1847), but too late to do more than to see some hard service on the blockade of Tuxpan.

After his return home (February, 1848) he was variously employed on ordnance, court-martial, and navy-yard duties.

In 1854 he was sent to the Pacific coast to establish the navy-yard at Mare Island, Cal. The four years passed here were uneventful, with the exception of the organization of the "Vigilance Committee" of 1856. Farragut's coolness and judgment in dealing with a delicate question of Federal and State jurisdiction not only saved the government from being drawn into a local quarrel, but prevented bloodshed.

In 1859–60 Farragut commanded the "Brooklyn" in the Gulf of Mexico, part of the time on special service with the American minister, Hon. Robert McLane.

At the breaking out of the civil war he was residing at Norfolk, Va., his adopted home. Being a man of broad national views, he promptly announced his allegiance to the Union, moved to the North, and after some delay was assigned to the command of the Western Gulf Squadron, January, 1862.

His passage of Forts Jackson and St. Philip, the defenses of New Orleans (April 23–24, 1862), in his fleet of wooden ships, was a grand achievement in naval warfare, at a time when the theory of the superiority of forts over ships was everywhere asserted. He seemed confident of success from the first. "As to being prepared for defeat," he wrote, "I certainly am not. Any man who is prepared for defeat would be half defeated before he commenced. I hope for success, shall do all in my power to secure it, and trust to God for the rest." And with his gallant officers and men he succeeded in passing the barrier of hulks, logs, and chains, and forts, destroyed the enemy's flotilla, and placed New Orleans under his guns.

As soon as possible he pushed on up the river to carry out his orders to open the Mississippi, and successfully passed the batteries of Vicksburg (June 28, 1862); but the great elevation of the batteries, and the absence of a co-operating land force of sufficient strength, rendered this movement of little real importance. His vessels on the coast of Texas, however, succeeded in capturing Galveston and Sabine City.

On March 14, 1863, in attempting a bold dash past the batteries of Port Hudson, a portion of his fleet was compelled to retire, and one of his ships —the "Mississippi"—was destroyed. But with his flag-ship and one small gunboat he continued on up the river, penetrating as far as Vicksburg, and finally established a blockade between Red River and Port Hudson. On the arrival of Porter from above, he returned to New Orleans by the Atchafalaya, and conducted the naval operations of the siege of Port Hudson until its surrender, July 8, 1863.

His most brilliant achievement was in passing Forts Morgan and Gaines, at the entrance to Mobile Bay, August 5, 1864. In this encounter he captured the ram "Tennessee" and gunboat "Selma." The forts subsequently surrendered to the combined naval and military forces. In this engagement he showed his decision of character in taking the lead in his flag-ship at a moment when disaster seemed certain. The dramatic incident of his viewing the conflict from a lofty position in the rigging, where he had allowed himself to be secured by a lashing of rope, has been authenticated by an autograph letter of Farragut's (September 25, 1864), in which he says, "I told you that Watson brought me the rope to tie myself in the rigging. So he did; but Drayton sent one up by the quartermaster when I was up in the *main* rigging. I was so much interested in what was going on around me that I hardly noticed it, but took it mechanically, and fastened it to the shrouds and around myself."

He received the thanks of Congress, and was commissioned rear-admiral July 16, 1862, and vice-admiral Dec. 21, 1864, and was finally promoted to the rank of admiral, July 25, 1866.

In 1867, in command of the European Squadron, he made an extended cruise in the "Franklin," and was received with marked attention at the European capitals.

Farragut had a high reputation in the service for industry, character, and efficiency. He was physically and morally brave and essentially modest, though with a pleasant appreciation of his attainments. His education in some respects was remarkable. He was an indefatigable reader, and spoke several languages. Among intimates his humor was proverbial. The purity of his domestic life was as unsullied as his professional career; there was nothing in either that required explanation or apology. His plans of battle appeared simple enough, but showed a thorough, minute, and painstaking preparation. His quickness of perception and resolution in the midst of conflict were his strongest points.

He died at Portsmouth, N. H., August 14, 1870. His remains were subsequently borne to Woodlawn Cemetery, Westchester Co., N. Y. (September 30), with great ceremony, where they now rest under a monument erected by his widow and son.—*Loyall Farragut.*

Farthel. An obsolete word for *furl.*

Fash. An irregular seam. A mold-mark on projectiles.

Fashion-piece. In wood construction, it is the aftermost frame timber, and is secured to the ends of the transoms.

Faskidar. The Arctic gull (*Cataractes parasiticus*).

Fast. A rope or chain confining the ship to a wharf. It is called according to its position a *bow-fast*, *head-fast*, *breast-fast*, *quarter-fast*, or *stern-fast.*

Fast Aground. So completely aground as to be immovable.

Fast-stayer. A ship which goes about or tacks quickly.

Father (*Eng.*). Dock-yard name for the builder of a naval vessel.

Father-lasher. A certain salt-water fish (*Cottus bubalis*), allied to the river bull-head. Its head is large, and its spines formidable. It is found on the coasts of Britain, Newfoundland, and Greenland. In the latter country it is extensively used for food.

Fathom. A measure of 6 feet, roughly made by extending both arms; used in measuring cordage, depths, etc. *To fathom*, to find the depth by sounding; to comprehend. The table shows the fathom of different countries:

Country.	Name.	Fathoms.	Feet.	Inches.	Metres.
England and America.	Fathom.	1	6	72	1.829
Russia. France. Holland.	Shashainh. Grande Brasse. Groote Vadem.	1	6	72	1.829
France. Holland.	Moyenne Brasse. Koopvaarders Vadem	.916	5.5	66	1.676
France. Holland.	Petit Brasse. Bussmans Vadem.	.833	5	60	1.523
Denmark & Norway.	Favn.	1.029	6 175	74	1.834
Portugal.	Braça.	1	6.004	72	1.829
France.	Brasse.	.925	5.541	66.6	1.086
Prussia.	Fadem.	.984	5.906	71	1.826
Spain.	Braza.	.916	5.492	66	1.786
Sweden.	Famn.	.974	5.843	70	1.824
India.	Bam.	1	6	72	1.829

FATHOM-WOOD. Refuse wood from ship-building,—sold by the fathom.

Fat-quarter. A broad and full quarter.

Faucon and **Fauconnet.** Old form for falcon and falconet.

Favor. To spare, or to be careful of. The spars are favored by being relieved of undue strain. A ship is favored when she is eased or allowed to go off during squalls.

Fay-fena. A Japanese galley of 30 oars.

Feam. A small lighter's windlass.

Fearnaught or **Dreadnaught.** Woolen cloth of great thickness.

Feather. In mechanism, a prism or bar of metal, usually steel, one side of which is firmly embedded lengthwise in the surface of a shaft, either in a cylindrical or conical portion thereof, the projecting portion being fitted to a slot in the hub of a wheel, pulley, coupling, etc., for the purpose of constraining such hub to the rotary motion of the shaft, and at the same time permit it to slide or be easily removed in direction of its axis. A feather is sometimes embedded in the surface of the bore of a hub and fitted to a slot in the shaft. It differs from a key in the fact that it is immovable. *To cut a feather*. See CUT.

Feather an Oar. To bring the blades in a horizontal position so as to cut the wind as soon as they are out of the water. It is done by dropping the wrist at the proper time.

Feathering Float. A paddle or float of a paddle-wheel, so arranged as to turn on an axis and present its broadside to the water at its lowest submersion, and to turn its edge to the water in entering and emerging.

Feathering Paddle-wheel. A wheel whose floats have a motion on an axis, so as to descend nearly vertically to the surface of the water, and ascend nearly the same way, avoiding beating the water in the descent, and lifting it in the ascent. The loss of power from these causes is due only to the quantity of water thrown off as spray, or carried around the wheel; and, so far as this action is concerned, a feathering-wheel is equivalent to a radial-wheel having twice its diameter. No economy is accomplished by avoiding "oblique action" in solid water. There are numerous devices for feathering-wheels. See PADDLE-WHEEL.

Feathering Propeller. A term applied to any propelling apparatus in which the blades or floats turn upon an axis so as to present their edges to the water in dipping or entering, leaving or returning, and their broadsides when the propelling force is most effective. The term is suggested by the action of the feathers of the wings of a bird, and is applicable to oars, paddle-wheels, or submerged wheels.

Feathering Screw. A screw-propeller in which the blades can be set in a fore-and-aft direction, so as to present a minimum resistance to a vessel's headway when under sail alone. The term also applies to screws in which the blades can be turned and reversed on their axes by the steering apparatus, thereby dispensing with a rudder.

Feaze. To untwist a rope's end; to pull it to pieces.

FEAZINGS. The unlaid or ragged end of a rope.

Febiger, John C., Commodore U.S.N. Born in Pennsylvania. Appointed from Ohio, September 14, 1838; attached to frigate "Macedonian," West India Squadron, 1838–40; sloop "Concord," Brazil Squadron, 1841–43; wrecked in "Concord" on east coast of Africa, 1843; attached to brig "Chippola," purchased by government at Rio de Janeiro, and used to recover and dispose of equipment of "Concord," 1843–44.

Promoted to passed midshipman, May 20, 1844; frigate "Potomac," Home Squadron, 1844–45; sloop "Dale," Pacific Squadron, 1846–47; frigate "Columbus," Pacific Squadron, 1848; sloop "Dale," African Squadron, 1850; coast survey, 1852–57.

Commissioned as lieutenant, April 30, 1853; sloop "Germantown," East India Squadron, 1858–60; sloop "Savannah," 1861.

Commissioned as commander, August 11, 1862; commanding the steamer "Kanawha," West Gulf Blockading Squadron, 1862–63 engagement off Mobile Bay, April 3, 1862; commanding steamers "Osage," "Neosho," and "Lafayette," Mississippi Squadron, 1863; commanding steamer "Mattabeset," North Atlantic Blockading Squadron, 1864–65; engagement with rebel ram "Albemarle," in Albemarle Sound, May, 1864; commanding steamer "Ashuelot," Asiatic Squadron, 1866–68.

Commissioned as captain, May 6, 1868; commanding steam-sloop "Shenandoah," Asiatic Squadron, 1868–69. While commanding the "Shenandoah," entered and surveyed Ping-Yang Inlet, west coast of Corea. Inspector of Naval Reserved Lands, from 1869–72. Commanding U. S. steamer "Omaha," South Pacific Squadron, 1872–74. Member Board of Examiners, 1874–76. Commandant navy-yard, Washington, D. C., 1876 to August, 1880.

Feckless. Weak and silly.

Feed. Material for replacing that consumed, wasted, or transformed, in animal or mechanical economy, as the feed-water of a steam-boiler which replaces the water evaporated, or food for animals. *To feed*, to supply a steam-boiler with water, or a furnace with fuel, etc.

FEEDER. A stream that supplies a body of running water. A passing cloud bringing more wind in a gale.

FEEDER FORCE-PUMP. See FEED-PUMP.

FEEDING-GALE. A constantly increasing gale, worse after every squall.

FEEDING PART OF A TACKLE. The running part.

FEED OF GRASS. A supply of vegetables.

FEED-PIPE. A pipe, connected with a feed-pump or other apparatus, through which water is supplied to a steam-boiler.

FEED-PUMP. A force-pump for supplying steam-boilers with water to replace that which is evaporated, blown off, or lost by leakage. It is generally worked by some moving part of the main engine. It consists essentially of a cylinder in which a piston or a plunger is fitted, and may be made either single- or double-acting; receiving- and discharge-valves, which in large pumps are usually made of india-rubber; valve-chests or chambers; an air-vessel or chamber; and a "feed safety-valve," which permits the water to escape to the hot-well or reservoir, when communication with the boiler is checked. When a feed-pump is driven by a small special steam-cylinder, and independent of the main engine, it is called an "auxiliary," or "donkey"-pump.

FEED-WATER. The water reserved from the condenser of a steam-engine for the purpose of supplying the boiler. The term is generally applied to water passing into a boiler from whatever source.

FEED-WATER PUMP. A pump for supplying feed-water to a reservoir, whence it can be readily drawn by a feed-pump or injector.

Feel the Helm. A ship *feels her helm* when she obeys it.

Feint. A pretended attack.

Fell-head. The top of a mountain not ending in a peak.

Felt. Fabric made of wool, or wool and fur, or hair, compacted by rolling and pressure, with glue and size. It is used as a non-conductor on steam-pipes, boilers, cylinders, etc.

Patent felt, mixed with tar, was formerly put between the sheathing and the ship's bottom.

Felucca. A small vessel of Arabic origin, with lateen-sails; the helm may be used at either end.

Female-hemp. See FIMBLE-HEMP.

Female-screw. A cylinder with a spiral inside, into which a screw works.

Fencing. The art of using a foil, or sword, in simulated or actual attack and defense. The changes which modern science has brought about in the mode of conducting combats both on sea and land have very much lessened the chance of personal encounters between combatants, and have, as a consequence, relegated the art of fencing to a far lower degree of prominence than it formerly had. The officer, however, still wears a sword, and occasions demanding a right knowledge of its use as a weapon of offense and defense, though not of frequent occurrence, are yet among the chances of active service; the art of fencing, therefore, should still be cultivated, both as a factor in an officer's efficiency, and as a useful and graceful accomplishment.

Fend. To keep off. *To fend off*, to shove off, to keep from contact. *Fend the boat*, to keep it from touching the ship or wharf.

FENDER. Wood, rope, or other material used to prevent chafe. *Mat-fenders* are made of rope mats. *Grommet-fenders* are rope-grommets grafted or covered over with rope yarns. *Canvas-fenders* are bags of canvas stuffed with oakum or hair. *Cork-fenders* are nets of small rope filled with cork-shavings. *Rope-fenders* are made of short pieces of rope, plaited together. A *pile-fender* is a loose pile, planted in front of a wharf, to absorb the shock of a boat.

FENDER-BAR. A bar passing along the ship's side, to absorb the chafe, just above the water-line.

FENDER-BOLT. An eye-bolt, through which the fender-bar passes.

FENDER-PILE. One of any number of large piles, the upper part of which projects a suitable distance above the surface of the water, driven at the corners and ends of wharves, piers, or ferry-slips, which, by their resilience, prevent destructive shocks to vessels coming alongside in a strong current, wind, or tide-way.

Fernan-bag. A small ditty-bag to hold tobacco. A monkey's cheek-pouches.

Fernandina. A port of entry and capital of Nassau Co., Fla., on Amelia Island, 28 miles N.N.E. of Jacksonville. It has a good harbor, and is the N.E. terminus of the Atlantic, Gulf and West India Transit Railroad. Steamboats run three times a week from here to Charleston and Savannah. Pop. 3150.

Ferrara. An old broadsword named after Andrea Ferrara, the famous Spanish sword-maker.

Ferrol. A seaport town and one of the principal naval arsenals of Spain, in the province of, and 12 miles N.E. of Corunna, on the north arm of the Bay of Betanzos. Lat. 43° 29′ 30″ N.; lon. 8° 13′ W. Its harbor, one of the best in Europe, is entered by a narrow strait, and is defended by the castles of San Felipe and Palma. The town on its north shore is strongly fortified on the land side. Its vast arsenal and dock-yard covers nearly 24 acres, and comprises many magnificent docks and store-houses. It has a general and military hospital, naval barracks, and schools of navigation and mathematics. Pop. 21,500.

Ferrule. An iron band on the mizzen topsail-yard. A bushing to expand boiler-tubes.

Ferry. A place where goods or passengers are conveyed over narrow waters. The boat used in conveying goods or passengers over a stream; it may be propelled by hand, or by horse- or steam-power.

FERRY-BOAT. A boat for transporting goods or passengers over narrow waters. See FERRY.

Fetch. To reach; to arrive at; as, to fetch to windward of a point. *To fetch away*, to break loose. *To fetch headway*, to gather headway. *To fetch the pumps*, to cause the pumps to draw by pouring in water from the top to expel the air. *Fetch* is also the extent of a bay or gulf from point to point.

Fettle. To put in order; to repair. *In fine fettle*, in good trim; in high spirits.

Feu de Joie (*Fr.*). A salute of musketry by files.

Fez. A red cloth skull-cap worn by Mohammedans, and frequently by sailors in the Mediterranean.

Fid. A square, wedge-shaped bar of wood or

iron, placed in a mortise in the heel of a topmast or topgallant-mast. The ends, resting on the trestle-trees, take the weight of the mast and sustain it in place. Iron fids are generally used, with a laniard attached to prevent them from falling from aloft. Screw fids have also been designed, so as to be taken out without lifting the mast. A conical pointed piece of lignum-vitæ, or other hard wood, used to open the strands of a rope in splicing or working it. An iron fid is properly a *marlin-spike*. These fids are called *hand-fids*, and are from 14 to 20 inches long. Larger conical pieces of wood, of various sizes from 30 to 40 inches long, used to open the eyes of rigging, are called *setting-fids* and *standing-fids*. A vent-plug of oakum. A quid of tobacco. *To fid* a mast is to sway it up to its place and insert the fid.

FID-HAMMER. A hammer having one end of the head pointed, so as to serve as a fid.

FID-HOLE. The mortise in the heel of a mast, into which a fid is inserted; they are in length half the diameter of the mast, and their width is two-thirds of their length.

Fiddle. A rack, used on a table, to keep the crockery on, formed of frames connected by tape or cord.

Fiddle-block. A block having two sheaves lying in the same plane, one above the other. They are used for burtons, yard-tackles, etc.; called also *long-tackle-block*.

Fiddle-fish. The king-crab (*Limulus polyphemus*).

Fiddle-head. The scroll on a ship's bow, that turns inwards, like the head of a fiddle.

Fiddler. A small crab with one claw longer than the other.

Fiddler's Green. A sailor's paradise, where dance-houses and kindred amusements abound.

Field-artillery. Light artillery for use on shore, in distinction from boat-artillery. See HOWITZER.

Field-carriage. The carriage for a light piece of ordnance, by which it is transported when on shore. See HOWITZER.

Field-day. A day of drills or exercises. A day for general cleaning or overhauling.

Field-gun. See FIELD-PIECE.

Field-howitzer. A howitzer mounted on a field-carriage for use ashore.

Field-ice. A large extent of floating ice, adrift or stationary. Detached pieces are *floes*, and when they suddenly reunite, cause *nips*.

Field of View. The circular space visible through a telescope.

Field-piece. A piece of ordnance for use on land, so mounted as to be capable of transportation.

Fiery-flaw. See FIRE-FLAIRE.

Fifer. The marine who plays the fife.

Fife-rail. A rail about the mast, supplied with pins to belay ropes to, and with blocks to lead them through.

Fig. In *full fig*, in full dress.

Figala. An East Indian vessel with one mast, and propelled by paddles.

Figger. A Smyrna trading-vessel.

Figgie-dowdie. Plum-duff.

Fight. An engagement or battle.

FIGHTING-LANTERN (*Eng.*). See BATTLE-LANTERN.

FIGHTING-CANVAS, or FIGHTING-SAILS. Sails used in action. Formerly, topsails and courses. In future, sails will be furled.

FIGHTING-STOPPER. An arrangement of two dead-eyes, connected by rope laniards, and furnished each with a tail of rope. When a shroud is parted in action, the tails embrace the severed parts, and then they are hauled together by the laniard. See STOPPER.

FIGHTING-TRIM. In proper trim to commence an action.

FIGHTING-WATER. Casks or tubs of water placed about the deck for use during action, or in cans in the magazine. Vinegar is added to it in some services.

FIGHTS. An old word for screens to conceal the men from the enemy. See CLOSE-FIGHTS.

Figure. The ornament at a ship's prow, whether a *scroll*, *fiddle-head*, *billet*, or *figure-head*.

FIGURE-HEAD. An image or carved figure formerly carried at the prow. The Phœnicians carried the figures of the marine-protecting deities, adopted from them by the Greeks under the name of Dioscuri, or Castor and Pollux. Ancient Egyptian ships carried a ram's head or a carved lotus. Roman ships carried the head of a lion, ram, dragon, etc. Early Norman ships commonly carried a dragon's head or serpent's head, and sometimes an archer. Full-length figures of Neptune, of Mercury, and other Greek gods were common in 1600–1700, and the statues in carved wood of great men, of allegorical subjects, as Hope, etc., were then used. Busts or half-length statues were more common. Many of these carvings were works of art. The adoption of ramming, and first the straight, then the ram-bow, caused them to fall into disuse, and they are seldom seen on iron or armored vessels.

Figure-of-eight. A knot made in the shape of the figure 8.

Fike. See FYKE.

Filadière. A small flat-bottomed boat of the Garonne.

File. In mechanical art, an implement of hardened steel, having its surface cut into sharp furrows or teeth, used principally for shaping or smoothing metals, but frequently used on other substances. There is a great variety of shapes, sizes, and degree of fineness of teeth or cut. The cross-section may be rectangular, square, round, half-round, triangular, or wedge-shaped (knife-edged); the longitudinal section usually tapers or curves from the "shank end," which receives the handle, to the point. The sizes of files are denoted by their length in inches, and the principal degrees of fineness by the terms "bastard," "second cut," "smooth," and "dead smooth." Small round files are called "rat-tail" files; files having parallel teeth cut in one direction only, that is, not crossed at a right angle by other teeth or furrows, are called "float-cut" files; and flat files having one or both their edges left blank, or without teeth, are called "safe-edge" files. *An old file*, a nickname for a cunning, humorous character.

FILE-FISH. One of a class of fishes having their skin granulated like a file. They are intermediate between the bony and cartilaginous fishes, and constitute the genus *Balistes*.

Filibuster. A freebooter. A name first applied to the adventurer Lopez in 1849.

Fill. *To fill the sails*, to trim the yards so that the wind shall blow on the after-part of the

sails. *To fill a yard*, to fill its sail. *To fill away*, to fill a sail or sails that have been aback. *To fill a ship's bottom*, to cover her bottom with broad-headed nails so as to give her a sheathing of iron. Copper sheathing is now preferred. *To fill in*, to put in timbers wherever solidity is required; as, between the frames in a ship.

FILL AND STAND ON. To fill the sails and resume the course after heaving to.

FILLER. A strip of wood inserted in a made mast to fill up a deficiency.

FILLING-ROOM. A small room formerly partitioned off from the magazine for a filling-place for shell, etc.

Fillet. The ornamental rings formerly cast about the muzzle or cascabel of a gun. The rounded surface joining the plane surfaces of a gun.

Filter. An apparatus for purifying water. Sailors call a stone filter a *drip-stone.*

Fimble Hemp, or Female Hemp. The hemp which produces no seed, and is chiefly used for domestic purposes. *Carl*, or *male* hemp is used for cordage.

Fin. An organ of a fish, consisting of a membrane supported by rays, or little bony or cartilaginous ossicles, and serving to balance and propel it in the water. Fishes move through the water chiefly by means of the tail, the principal office of the fins being to balance or direct the body, though they are also, to a certain extent, employed in producing motion. Jocular for *hand; tip us your fin*, shake hands.

FIN-BACK. A whale of the genus *Balænoptera*, having a tough fin on its back. Some are 80 to 90 feet long. It has little oil, no whalebone, and is hard to catch. Also called *finner* and *finwhale.*

Find. To provide; to furnish.

Finding. The verdict of a court-martial.

Findon Haddock. A kind of Scotch haddock.

Fine. *To fine* the under-water body is to prolong and sharpen the ends. A *fine* entrance is a sharp under-water part of the fore-body of the ship.

Finger-shell. A marine shell resembling a finger.

Finner. See FIN-BACK.

Finnie. Scotch salmon less than a year old.

Finnock. A kind of Scotch salmon.

Fintrum Speldin. Small dried haddock.

Fiord. A deep narrow inlet of the sea on the Norwegian coast.

Fir. Fir is the wood of a tree of the genus *Abies.* The Scotch fir is a pine. For the frames of men-of-war its use has been rare, but 17 English men-of-war were built of it from 1750 to 1806 Their average life was 9 years. Fir is used for ship's spars, and for plank of the bottom. The best fir comes from Riga and Dantzic. The early frigates of our navy were made of fir, and lasted fairly well.

Firbome. An old term for a beacon.

Fire. The effect of combustion; a conflagration. To kindle; to set on fire. To discharge a fire-arm; the discharge of fire-arms.

A raking fire is delivered from ahead or astern of a vessel, the projectiles passing through in the direction of her length. In early days one of the great points in a sea-fight was to rake the opposing ship without being raked by her. Since the introduction of ironclads it is not a matter of so much importance.

To fire at will is to fire the guns independently of each other, each gun-captain seizing the most favorable opportunity; this firing is used in action when the object is visible.

To fire in succession is to fire one gun after another in regular order, beginning with the forward gun if the wind be aft, or with the after gun if the wind be from forward; this firing may be used at the beginning of an action, or when a steady continuous fire is desired.

Quick firing is rapid firing at will, the tangent sight not being raised; this firing is used when close alongside an enemy, when but little pointing is required.

When a gun is so laid that the projectile strikes the object without grazing between the gun and object, the fire is *direct;* this firing is used at short range or at great ranges, when great penetration is desired, or when the surface between the gun and the object is so rough that the force and direction of the projectile would be injuriously affected. When the gun is so laid that the projectile makes one or more grazes before reaching the object, the firing is denominated *ricochet;* that properly so called is performed with the gun laid level, or at most at 3° elevation; though shot will often ricochet at greater angles of elevation.

Practically, ricochet fire is of no value from rifled guns firing elongated projectiles. In experimental practice over perfectly smooth water, it will often be observed that successive projectiles of high velocity and rapid spin maintain a certain uniformity of flight on the first one or two bounds; but the *slightest* irregularity of the reflecting surface causes them to lose all certainty of direction. The flatness of the trajectory of the rifle, by greatly increasing the dangerous space, has correspondingly decreased the importance of ricochet fire. For smoothbores, however, ricochet firing upon a smooth surface, within certain distances, has some important advantages over direct firing. When the guns have very little or no elevation, and are near the water, as they are in a ship's battery, the projectile strikes the water at a very small angle; its flight is not greatly retarded by the graze, and it rises but little above the surface in its course. The distant charge should always be used, but the penetration is not to be depended on beyond 1500 yards against unarmored ships of war. At low elevations it requires only correct lateral direction, since the projectile would rarely pass over and would probably strike a vessel if within its effective range, whether the actual distance had been correctly ascertained or not. The deviation of the projectile is, however, generally increased by ricochet and in proportion to the roughness of the surface of the water. Even a slight ripple will make a perceptible difference not only in direction, but in range, penetration, and the height to which the projectile will rise in its bounds.

Although these facts demand attention, yet when the estimated distance does not require an elevation of more than 3°, projectiles from guns pointed rather too low for direct firing will probably ricochet and strike the object with effect, even when the water is considerably rough. This may be called *accidental ricochet.* When

the water is not smooth, the most favorable circumstances for such firing are when the flight of the shot is with the roll of the sea and that roll is long and regular. Ricochet will be effective against small objects up to 2000 yards, but should not commence at less than 600 yards. Shot rarely ricochet at all with elevations above 5°, and the bounds are always higher, with equal charges from the same gun, as the elevation of the gun is increased.

A fire is said to be *curved* when the projectile clears an intervening object and descends upon the target. A fire is said to be *plunging* when the target is below the level of the gun: it is particularly effective against vessels.

Horizontal fire includes all kinds where the velocity of the projectile is due to the charge. *Vertical* fire includes all kinds where the velocity of the projectile on impact is mainly due to the attraction of gravity. See MORTAR.

Concentration of fire may be desirable under certain circumstances; and arrangements have been sometimes made to secure it by the simultaneous discharge of a number of guns upon some part of an object whose distance is known. The advantages of these arrangements are not very obvious, excepting in cases where the position of the enemy may be visible from one part of a ship and not from all the guns in the battery. The object sought to be obtained is therefore to aim from inboard at an invisible target, the distance and direction of which are indicated by the commanding officer. It is consequently necessary that he shall be so placed as to obtain a distinct view of the enemy, or have suitable observers to inform him of his exact position.

FIRE-ALARM. A signal to denote that a fire has broken out, and to summon the officers and men to their stations for suppressing it. See FIRE-BILL.

FIRE-AND-LIGHTS. A nickname for the master-at-arms.

FIRE-ARM. A weapon acting by the force of gunpowder, discharging a ball. The Chinese claim to have used fire-arms in 304 B.C. A stone-thrower was used in China in 757 A.D. In 1200 the Mongols used fire-arms, and in 1258 Genghis Khan used them. They became of universal use during the 14th century. One of the first instances of their use afloat was by the Venetians against the Genoese, in 1377. Other explosive materials have been tried in them with but little success.

FIRE-ARROWS. Arrows wrapped with tow soaked in turpentine, used frequently in the naval actions of the 17th century. The last instance of their use afloat in a large action was that of the French in the East Indies in 1758.

FIRE AWAY! Go on with your remarks.

FIRE-BALLS. Balls made of tow and tallow, mixed with sulphur and pitch.

FIRE-BARRELS. Small stout barrels filled with inflammable composition, used in fire-ships, to increase the combustion.

FIRE-BAVINS. Short bundles of brush-wood dipped in inflammable composition, and fastened about parts of a fire-ship to spread the flame.

FIRE-BELL. The quick ringing of the ship's bell, the signal for a fire.

FIRE-BILL. The bill giving the stations of the crew on an alarm of fire. They are distributed in proper places to work the pumps, lead out hose, act as axmen, or smotherers, assist in hauling up sails, in hoisting provisions, in getting out the boats, drawing the charges of the guns, etc. See EMERGENCIES AT SEA.

FIRE-BOOM. A boom swung out from the ship's side to keep off fire-ships. See FIRE-SHIPS AND RAFTS.

FIRE-BRICK. An infusible kind of brick used for lining the inside of furnaces or flues not exposed to water, when necessary to protect them from intense heat.

FIRE-BRIDGE, or BRIDGE-WALL. A wall which forms the back end of a furnace, and over which the heated gaseous products of combustion pass. It may be built of fire-bricks, or it may be an iron shell filled with water and forming part of the boiler. Fire-bridges are also built at intervals in the large masonry flue under long cylindrical boilers, for the purpose of mixing the gases and bringing them in close contact with the surface of the boiler.

FIRE-BUCKET. A bucket of canvas, leather, rubber, wood, or metal, used in case of fire. Those used in the navy are made of light tanned sole-leather, and a laniard, several fathoms long, is attached to each, to be used in drawing water from aloft.

FIRE-CLAY. Clay (a silicate of alumina) from which fire-bricks are made and in which they are laid or cemented.

FIRE-CREW. The crew of a fire-ship that conduct her into action, and after inflaming her leave her to her fate.

FIRE-CURTAINS. Curtains of canvas dipped in inflammable mixtures, and suspended from the beams of a fire-ship, to increase the combustion.

FIRE-DRAKE. A meteor. The *corpo santo* of old navigators.

FIRE-EATER. A hotspur. A man fond of fights and fighting.

FIRE-EXTINGUISHER. A small portable apparatus for extinguishing an accidental fire in its incipiency. Its action is to throw upon a fire a small stream of water surcharged with carbonic gas. It consists essentially of a very strong metallic case or vessel, which is filled with water, together with a suitable quantity of carbonate of soda or lime, and which contains a small receptacle, made of lead, glass, or other suitable material, for holding a quantity of sulphuric acid sufficient to combine with the carbonates and form sulphates, while releasing carbonic acid gas, which the water holds in suspension, and which, by its pressure, gives force to the stream. The acid and carbonates are securely isolated from each other until the apparatus is required for use. There are many devices for effecting the combination or mixture, one being designed as early as 1816. The fire-extinguishers furnished the navy are now of the Babcock pattern, in which carbonic acid is generated, and cast on the fire.

FIRE-FLAIRE. The sting-ray (*Raia pastinaca*).

FIRE-FLAUGHTS. The northern lights.

FIRE-HEARTH. The hearth about the galley.

FIRE-HOOPS. Hoops wrapped in tow and soaked in inflammables. Used by the Knights of Malta in the middle ages.

FIRE-LOCK. A gun-lock inflaming the powder by striking a flint. A gun having a flint-lock.

FIREMAN, or STOKER. A man who manages fires. On board vessels of war firemen are di-

vided into two classes, viz., first- and second-class firemen. A first-class fireman is required to be thoroughly skilled in making, maintaining, and cleaning fires with all the varieties of coal in general use, and in all the preparations for starting fires and raising steam in boilers. He must be acquainted with the methods of keeping the water in boilers at the proper height and density; be familiar with the various cocks and valves in common use in marine machinery; capable of packing stuffing-boxes, making steam-joints, "laying up" and preparing packing, cleaning bright-work, and starting or stopping and lubricating either the main or auxiliary engines or pumps. Skill in the use of mechanics' tools adds to his efficiency.

A second-class fireman must be skilled in the management of fires, boilers, and pumps, and have a good general knowledge of the duties of a first-class fireman.

A fireman is, also, one whose duty it is to extinguish fire.

Fire-quarters. The assembly of the crew on an alarm of fire. The fire-bill gives each his station, and this is to be taken instantly on an alarm. Pumps are rigged and manned, ports closed, charges drawn from the guns, hatches covered, sails trimmed, and preparations made for getting out the boats, if at sea, or they are lowered in port. Friday is the day usually set apart for the purpose of drilling in this.

Fire-raft. A raft of floating timber, arranged with combustibles, and set afloat against an enemy's fleet. See Fire-ships and Rafts.

Fire-room, or Stoke-hole. A room or space at the fronts of steam-boilers devoted to the management of the fires, and, generally, to all operations connected with the management of boilers under steam, such as feeding, observing pressures and temperatures, height of water in boilers, degree of saturation of water in boiler, blowing, etc. When the fronts of boilers face amidships, it is a fore-and-aft fire-room, and when they face forward or aft, it is called an athwart-ship fire-room.

Fire-ships and Rafts, Explosion-vessels and Booms. Fire-ships are vessels loaded with combustibles, set on fire, and drifted or propelled against fleets, forts, or obstructions. Such inventions have been used for centuries, and have played an important part in many contests. The first account of the use of fire-ships is at the siege of Tyre, 333 B.C. The Tyrians here sent a galley, loaded with stones and prepared with sulphur, etc., against the mole built by Alexander, partially destroying it. Six other instances of the use of fire-ships before the Christian era are recorded. Fire-ships were used by the Rhodians in a contest with the Syrians, 191 B.C., and Livy alludes to their use by that maritime nation in 190. The Carthaginians, in 149 B.C., sent boats filled with combustibles against the Roman fleet under Manlius, attacked and partially destroyed it. In 38 B.C., two of the fleets of Augustus were destroyed by Cassius; the first, under Pomponius, by several ships filled with pitch, hemp, etc.; the second, under Sulpicius, by forty fire-ships, in the harbor of Vibo.

Two more instances of their use are given before the introduction of Greek fire. In 439 Genseric towed a number of fire-ships out of Carthage harbor against a Roman fleet under Basilicus, and destroyed most of it. Belisarius, in 545, destroyed a bridge thrown across the Tiber near Rome by Totila, by a fire-boat, carried in a tower erected on two galleys, by means of which the boat was dropped on the bridge.

In 673, an Egyptian, Callinicus, in the Greek service, invented Greek fire, and the use of this combustible liquid seems to have given a new impulse to the employment of fire-ships. This liquid, long known under its various names of "Ignis Græcus," "Greek fire," "Wild fire," and "Maritime fire," was the forerunner of powder, consuming all within its reach, and only being quenched by sand, vinegar, and acids. It was poured from sides of ships, from battlements and turrets, shot in balls and arrows, and ejected from horrid-mouthed brazen tubes. The Greeks long preserved the secret, but the Saracens finally obtained it, and its disuse only came with the advent of powder. Sometimes, as at Constantinople in 717, old vessels were impregnated with this liquid, and thus made more formidable, set adrift against the enemy. There, also, in 951, 953, the Russian fleets felt their force, two being nearly destroyed by the fire-galleys sent against them.

During the Crusades we meet with Greek fire continually, and also with fire-ships. Notable are those used at Zara in 1171 against the Venetians, two unsuccessful attacks, one with 17 fire-ships, by the besieged Greeks against the Venetians at Constantinople in 1204, and the fire-ships used by the Pisans at Geneva in 1218. The fire-ships used at Reggio by the Saracens are called "Jeremitas" by old chroniclers.

In 1370, the English first used them at Zuruckzee, and they were visited by them at Rochelle in 1372.

They were first used in a sea-engagement by the Spaniards against the English in 1406. The Venetians at Syracuse in 1433, and the Knights at Rhodes in 1440, used these weapons.

The more important use of fire-ships, the inauguration of explosion-vessels, and the use of an elaborate boom for defense, occurred at the siege of Antwerp in 1585. Thirteen fire-ships were used, and set afloat against the boom with the explosion-vessels, but the latter only caused disaster The Great Armada was first disorganized and thrown into confusion by eight fire-ships sent against it by Lord Howard at Calais, July 27, 1588. Fear of these led the Spaniards to run out, and they were met and defeated on Goodwin Sands soon after.

During the 17th and 18th centuries the use of fire-ships became almost universal. Nearly every fleet had them, from one to twenty in number, and in the long and bloody wars between the English and the Dutch they were often used with disastrous results, the large fleets of cumbersome ships being particularly vulnerable to their attacks. They were then used in sea-actions. Three ships were destroyed by one in 1653, and four Dutch ships in 1665 by one, the loss of life being heavy. One hundred and ninety Dutch vessels were destroyed by fire-ships at Vreeling. Fire-ships were used in connection with explosion-vessels in the English attacks on St. Malo, Dieppe, and Dunkirk in 1693–94, and at Dunkirk a peculiar "smoke-ship" was used to disconcert the aim of the gunners, but it failed.

They were used on this continent at Quebec in 1759, and at Philadelphia in 1777. They were last used in sea-actions by Matthews in 1746, and by Boscawen in 1759. From this time they diminished in numbers, and we only hear of them as occasionally employed during the present century. Fire-ships were used at Basque Roads in 1809, again with explosion-vessels, but effected nothing. At Washington in 1814, Commodore Rodgers used them without effect, and the Turks had five in their fleet at the battle of Navarino. In 1822, the Greeks at Scio revenged themselves on the Turks by sending against their victorious fleet two fire-ships and several launches, June 7. Two ships were destroyed, and more than two thousand men killed.

In 1840–41, the Chinese sent fire-rafts and junks against the English on five occasions, but effected nothing. Fire-rafts were sent down the Mississippi, first in October, 1861, throwing the ships into confusion, again from April 16 to April 21, against Farragut's fleet, adding to the terrors of the night-assault of Forts Jackson and St. Philip, but effected little, and were easily avoided. One, however, was pushed by a ram, and set the "Hartford" on fire, but the flames were extinguished. The steamer "Abtao" was fitted as a fire-ship in 1879 by the Chilians, but was not used.

Fire-ships were generally old vessels of 50 to 150 tons. In a central compartment fire-barrels were placed, filled with powder, pitch, and tallow. Troughs led along the decks, in which reeds, dipped in rosin, pitch, tallow, and powder, were placed, bundles of brush aiding them, and fuzes led through scuttles to the barrels below, and to sally-ports. Small iron pieces blew the ports open, and barrels of composition on deck, boxes in tops, channels, from bowsprit, davits, etc., and fire-curtains from the beams, aided the conflagration. Fire-ships sailed to windward, fought to leeward, prepared for battle, and went into action, on signal. The duty was hazardous, and little quarter was given to captured crews. Steam-vessels will be more formidable as fire-ships, and may yet be used in defending harbors, but fire is not so terrible to iron-cased ships, with wire rigging.

Explosion-vessels have been used less often than fire-ships. The first was at Antwerp. They were invented by Giambelli, an Italian. Four were used, but one broke the boom and killed 800 people, blowing up six ships, and flooding the shores. They were strong flat boats, containing 7000 pounds of powder, in a brick well, roofed with heavy stones, and charged with missiles of all kinds. The French prepared a vessel in 1688, to use at Algiers, but did not use it. Explosion-vessels were sent against the ports of St. Malo, Dieppe, and Dunkirk on four occasions, in 1693–94, but all failed to damage the towns. The next use of explosion-ships was that of our forces at Tripoli, the ill-fated "Intrepid," in which all those engaged were killed. This was during the night of September 4, 1804. The ketch was sailed in, and parted company with her convoy of 3 vessels at the entrance of the harbor, and was last seen from them sailing in towards the mole. Suddenly she blew up, either having been fired by her crew or exploded by a shot from the forts.

During the same year a floating-mine was sent against Fort Rouge, at Calais, but effected no damage.

In 1809 several attempts were made against Rochefort with floating-mines, some of which were ships of large dimensions. The explosions shook the earth for miles around, but nothing was gained by them.

Finally, more formidable attempts were made against the French fleet at Basque Roads. Three explosion-vessels and 9 fire-ships were sent against the fleet and boom. The explosion-vessels were made by placing firmly-wedged logs in the hold, piling spirit-casks, containing 1500 barrels of powder, and bound round with hempen cables. Several hundred shells were placed on top, and some 3000 hand-grenades wedged with sand. These were sent under sail, and one was swept away by a fire-ship, but one exploded near the boom, breaking it by the force of the wave.

At Wagram, on the Danube, boats filled with 5 barrels of powder, arranged to be fired by the carrying away of the mast on collision with the bridge, were sent down the river, but effected nothing.

Lord Exmouth took an explosion-vessel to Algiers in 1816, but did not use it.

The last occasion on which an explosion-vessel was used was at Fort Fisher, December 24, 1864. An old steam-vessel was here used, and the powder was stowed rather loosely in bags about the lower decks, while fuzes, clock-work, and a fire were depended on to ignite the formidable charge. Towed in and anchored within 300 yards of the fort, the charge was fired in time, causing a severe shock, but no damage to the fort.

Booms are naturally connected with this subject, having been used principally to keep fire-ships out of harbors. We find records of such defenses as early as the siege of Syracuse, 413 B.C. Chains were used in the harbor of Constantinople as early as 700 B.C. In the middle ages such defenses became more common, and the further defense of sunken ships was inaugurated by the Rochellais in 1371. The first formidable defense was used at Bonifacio, in Corsica, in 1420, where a bridge of great plank was defended by 5 ships ranged in a line. This was surpassed by the great Antwerp structure, built by the Duke of Parma in 1585, a structure made partly of piles and partly of a floating-bridge of vessels, moored head and stern, and defended by anchored floating-batteries. As we have seen, this was broken by Giambelli's explosion-vessel, but it was repaired the same night, and served its purpose.

During the 17th and 18th centuries these defenses were much used, sometimes chains only being thrown across the harbor, at others ships were sunk, hulks with heavy batteries anchored near, etc.

The earliest formidable attempt to use a boom was at Basque Roads, in 1809. Heavy cables were here fastened to logs and anchored across the channel, while line-of-battle ships at either end defended the structure. This boom was broken by Cochrane's explosion-ships.

During the civil war in this country torpedoes planted in the stream added their force to the defense of a boom, and elaborate systems of booms were made. At Charleston extensive series of such were found. When Farragut's fleet at-

tacked New Orleans formidable chains stretched across the river, and buoyed up by hulks, were first encountered, and destroyed by slipping.

Sunken vessels were frequently employed, notably at Charleston, effectually closing the channels.

The latest use of booms was by the Paraguayans, in their war of 1864–68 with Brazil.

Booms will not answer alone to obstruct a harbor, but combined with torpedoes, batteries, and sunken obstructions, they will always be found useful for the purpose.—*F. S. Bassett, Lieutenant U.S.N.*

Fire-surface. The surface of a steam-boiler which is exposed to the fire or furnace heat.

Fire-tub. A tub, provided with a wire grating, placed at the foot of a canvas shute, by which empty powder-boxes are returned from the deck above.

Fire-works. The rockets, blue-lights, false fires, and chemical signals used on board ships. They are packed in light boxes, and placed under the eye of a sentry, away from the magazine.

Firing-key. That key of an electric machine or battery which, upon being pressed, closes the circuit, and fires the gun or torpedo connected with it.

Firing-lever, Firing-pin, Firing-bolt. The assemblage of levers, etc., by which the charge of a towing torpedo is fired.

Fires. In mechanics, the masses or beds of burning fuel in furnaces.

Fires, Bank. To collect fires into small heaps or "banks," covering them heavily with fresh coal, and leaving a large portion of the grates bare, so that the draft may not pass through the incandescent fuel; the object being to suppress combustion, and the consequent formation of steam when no longer required for immediate use, and, at the same time, to preserve a desired pressure and temperature of steam, and retain sufficient fire to readily ignite the fuel required for a full or "spread" fire. The best place to form a bank is near the mouth of the furnace, and a few inches clear of the dead-plate, and it should be as compact as possible.

Fires, Haul. To entirely withdraw the fires from the furnaces, either while they are burning briskly or nearly extinguished. This operation is performed whenever a boiler becomes useless or dangerous from excessive leakage or from overheating caused by scant water-supply, or when it is known that steam will not be required for a definite period of time, and it is desirable that the boiler be cooled, cleaned, or repaired expeditiously.

Fires, Spread. To open or spread banked fires over the whole surface of the grates, and, at the same time, to supply them with the requisite quantity of fuel for forming steam.

Fires, Start. In steam-enginery, to kindle new fires in the furnaces of a steam-boiler for the purpose of raising steam when the machinery has not been in use for a period of time. The principal preparations required are, that the man-hole, hand-hole, and other "joints" are properly made; that the boiler is filled with water to the proper level; that the mouth or front of the furnace is supplied with kindling-wood and other inflammable material; and that the grates, on parts not occupied by kindling-stuff, be thinly covered with coal so as to check the draft through them at the back ends of the furnaces and direct it upon the fire in front. In vessels of war these preparations are usually completed before the order to start fires is given.

Firing. The act of kindling or maintaining fires.

Firing Tools. Tools or implements for managing fires. They consist of large steel "scoop-shovels" for handling coal and ashes; "slice-bars," which are stout bars of round iron flattened and pointed at one end and formed into an eye-handle at the other, and having sufficient length to reach the back end of a furnace, leaving two or three feet to project outside,—used to pass under the fires close to the grates for the purpose of detaching clinkers or breaking up caking coal; "pickers," which are bars or rods having the same length as slice-bars, though of lighter material, and having the fire end bent at right angles and flattened so as to pass between the grate bars from underneath,—used for removing ashes and stirring fires without opening furnace doors; "devil-claws," bars or rods having three bent prongs at their ends,—used for withdrawing clinkers from a fire; and "hoes," the fire ends of which are provided with flat "blades" or plates of iron fixed at right angles to the bar,—used in banking or hauling fires. The above-mentioned tools, except shovels, are sometimes called "fire-irons," and, like the slice-bar, are provided with handles, and have sufficient length to reach the back of a furnace and project a proper distance outside, so that the fireman may not be compelled to approach the fires too closely.

First Lieutenant. The executive-officer (which see). An officer of marines ranking with a master in the navy.

First Mate, or First Officer. The officer of a merchant ship next in rank to the master.

First, or Prime Meridian. See Meridian.

First Point of Aries. The vernal equinoctial point. See Aries.

First Point of Cancer. The summer solstitial point. See Cancer.

First Point of Capricorn. The winter solstitial point. See Capricorn.

First Point of Libra. The autumnal equinoctial point. See Libra.

First-rate. A ship of the first-rate is one of the highest grade. In our navy it comprises all steamers of 4000 tons or more, and ironclad steamers of 3000 tons or more.

First Watch. The watch, or period of time from 8 to 12 P.M. The portion of the crew on duty at that time.

Firth. See Frith.

Fish. To angle for fish; hence, to take anything out of the water. To hoist the fluke of the anchor up to the bill-board. To secure a spar with a fish. To search for a star. A vertebrate animal breathing through gills and living in the water; the name is also applied to mammals, as whales, etc. Fish are divided by naturalists into six families, most of which are marine. A purchase used to raise the fluke of the anchor up to the bill-board. A piece of wood or iron used to strengthen a damaged spar. Fish is used as an epithet; as, *queer fish*, *odd fish*, etc. *Fresh fish*, greenhorns. *As mute as a fish*, *as dry as a fish*, expressions used to denote perfect silence, extreme thirst. *Fish! Fish!* The cry of a whaler when a whale is sighted.

FISH-BACK. A line from the back of the fish-hook, to assist in hooking it to the arm of the anchor.

FISH-BOOM. A boom or spar by the aid of which the anchor is fished. It usually has one end connected to an eye on the foremast by a goose-neck, and the tackle connected to the other end, a double block hooking to it, and the fall leading up through a sheave in the boom, a block on the foremast, and then on deck. Sometimes a pennant is used, leading through the sheave on the boom. A topping-lift elevates the boom, and it is moved by small guys on either side. When not in use the boom is lowered into an iron crutch on the forecastle.

FISH-DAVIT. See DAVITS.

FISHER-FISH. A species of *Remora*, said to be trained by the Chinese to catch turtle. When a turtle is perceived basking on the surface of the sea, the men, avoiding all noise, slip one of their remoras overboard, tied to a long and fine cord. As soon as the fish perceives the floating reptile he swims towards it, and fixes himself on it so firmly that the fishermen easily pull in both together.

FISHERMAN'S BEND. A knot, for simplicity called the king of all knots. Its main use is for bending studding-halliards to the yard, by taking two turns round the yard, passing the end between them and the yard, and half hitching it round the standing part.

FISHERMAN'S WALK. The short walk afforded by the deck of a fishing-boat, "three steps and overboard."

FISH-FAG. A fish-woman. A female fish-porter.

FISH-FALL. The rope forming the purchase known as the fish.

FISH-FLAKE. A stage on which fish are dried.

FISH-FRONT. A strengthening slab on the front of a made mast.

FISH-GARTH. A fish-weir on a river-bank.

FISH-GIG. A spear with several barbed prongs for spearing fish.

FISH-HACK. The fish *Gobius niger*.

FISH-HOOK. A hook used in angling. A large iron hook attached to the fish-pendant, or to the lower block of the fish-purchase, used to hook the arm of the anchor so as to fish it.

FISHING-BOAT. A small boat used for fishing.

FISHING-FROG. The devil-fish or angler (*Lophius piscatorius*).

FISHING-GROUND. A bank or shore frequented by fishermen.

FISHING-SMACK. A fishing-vessel having a well in the hold to preserve fish alive.

FISHING-TACKLE. Lines, hooks, rods, nets, etc., for catching fish.

FISHING-VESSELS. All vessels employed in fishing.

FISH-PENDANT. A large rope attached to the lower block of the fish-purchase and leading through a sheave in the fish-boom, having the fish-hook at its lower end.

FISH-PURCHASE. See FISH-TACKLE.

FISH-ROOM. A room in old men-of-war, between the after hold and the spirit-room, where fish, and sometimes spirits, were kept.

FISH-SPEAR. A short spear used in fishing.

FISH-TACKLE. The assemblage of rope, blocks, and hook by which the anchor is fished.

FISH-TAIL PROPELLER. A propeller consisting of a blade hung on pivots, the axes of which are not coincident with the centre of pressure of the blade, attached to the end of a lever oscillating in a plane parallel to the direction of the vessel. The automatic oscillatory motion of the blade itself is constrained to a desired angle by stops, and it is so arranged that its action can be reversed. The device has never met with practical success.

FISH-TORPEDO. A self-impelling torpedo. See TORPEDOES.

FISH-WIFE, or FISH-WOMAN. A woman who deals in fish. A female fish-seller.

Fist. To lay hold of; to seize. *Hand over fist*, rapidly.

Fistularia. A genus of acanthopterygious fishes characterized by having the head prolonged into a slender tube, with the mouth at the extremity,—named by Linnæus.

Fit. To adapt to any purpose. *To fit the rigging*, to worm, parcel, and serve it, turn in dead-eyes,—in short, to prepare it for use at sea. *To fit out*, to supply with necessaries.

FIT-ROD. A small iron rod with a hook at one end, used to sound the holes for bolts in a ship's side.

FITTED FURNITURE. Spare articles, such as bucklers, chocks, port-lids, etc., furnished to a ship.

Fiume. A seaport town of Austro-Hungary, and the only important seaport for the outlet of the produce of Hungary, situated on the small river Fiumara, where it falls into the Gulf of Quarnero, at the N.E. extremity of the Adriatic. Lat. 45° 19′ 36″ N.; lon. 14° 26′ 45″ E. The harbor is indifferent, and admits only small vessels, but the roadstead has depth of water for vessels of any size and is well sheltered. Pop. 13,500.

Five-fingers. A name of the star-fish (*Asterias*).

Five-share-men. Men who enlist on shares of one-fifth in whalers.

Fixed-ammunition. See AMMUNITION.

Fixed-blocks. An old name for the chess-trees.

Fixed Stars. See STARS.

Flabbergast. To astonish by extraordinary statements.

Flag. The national colors or standard. Anciently a standard consisted of an object fixed to the end of a pole and borne like the modern flag, but, unlike it, not intended to wave or flutter with the wind. The Egyptians used an animal, the earlier Greeks a piece of armor, Romulus a bundle of hay, his descendants a hand, and the later Romans the eagle. The Crusades made the cross a favorite standard with the nations of Europe. Napoleon adopted the eagle of the Romans, and Austria and Russia the double-headed eagle, which had originated with the emperors of the East to symbolize their claim to rule both the eastern and western empires.

The national flag of the United States assumed the form which it now has after many experiments and as the result of much thought and discussion. The flags used by the colonies before their separation from the mother-country would naturally be those of England. This, however, does not appear to have been strictly the case,—several flags, differing more or less from those of that kingdom, having been adopted at different times previous to the Revolution.

The ancient national flag of England was the banner of St. George (a white field with a red cross).

The cross of St. George, as early as the 14th century, had been a badge almost universally worn by the English soldiery. It was worn over the armor, and was afterwards adopted as the national standard. This formed the national colors of England till 1606, when, by royal proclamation, the cross of St. Andrew (a white cross on a blue field), which had been the badge of the Scots as early as the Crusades, was united with it. This standard was called the "King's Colors," and was required to be displayed from the maintop of British vessels; those from South Britain to carry the St. George's cross, and those from North Britain the St. Andrew's cross, from the foretop. As the "King's Colors" were prescribed authoritatively for "subjects traveling by sea" only, it is probable that the St. George's cross-flag continued to be used quite generally by the *English* subjects of Great Britain.

It appears to have been in use in Massachusetts, from the following curious circumstance: It seems from the early records that, in 1635, complaint was entered "that the ensign at Salem was defaced; viz., one part of the red cross was taken out." On an examination of the case before the General Court, it was shown that the mutilation was done, not from disloyalty to the flag, but "upon this opinion: That the red cross was given to the King of England by the Pope, as an ensign of victory, and so a superstitious thing, and a relic of Antichrist." The account continues: "Because the Court could not agree about the thing, whether the ensigns should be laid by in regard that many refused to follow them, the whole case was referred to the next General Court; and the commissioners for military affairs gave orders, in the mean time, that all ensigns should be laid aside."

During the interim, a new flag, having for an emblem the red and white roses in place of the cross, was proposed; and letters in relation to the matter were written to England for the purpose of obtaining "the judgment of the most wise and godly there."

This project seems to have been relinquished; for in December, 1635, the military commissioners "appointed colors for every company, leaving out the cross in all of them, and appointing the King's Arms to be put into that of Castle Island (Boston.)"

The next year, however, a difficulty arose between the authorities and the masters of some English ships, in consequence of the "King's Colors" not being displayed from the fort on Castle Island; and "the Governor, with the consent of Mr. Dudley, gave warrant to Lieut. Morris to spread the King's Colors at Castle Island when the ships passed by, yet with this protestation: That we hold the cross in the ensign idolatrous; but, this being the King's fort, the Governor and some others were of opinion that his own colors might be spread upon it." There being no "King's Colors" to be found to display at the fort, they were presented by Capt. Palmer, of one of the ships, "and the Governor in requital sent him three beaver-skins."

This flag was used only at the castle, being excluded by religious opinion from general use. The one containing the king's arms continued to be used till after the establishment of the republic in England. The Parliament had adopted, as the colors of England, the old standard of the cross of St. George; and in 1651, the General Court of Massachusetts ordered that, "as the Court conceives the old English colors now used by the Parliament of England to be a necessary badge of distinction betwixt the English and other nations in all places of the world till the State of England shall alter the same, which we must desire, we, being of the same nation, have therefore ordered that the captain of the Castle shall presently advance the aforesaid colors of England upon the Castle upon all necessary occasions."

The St. George's cross-flag appears to have been used in the colonies, but frequently with some variations, during the next half-century, or until the "Union Flag" was prescribed by Parliament, in 1707. A crimson flag, of which the Union was a St. George's cross on a white field, was one most frequently used. Sometimes a pine-tree was represented in one of the squares formed by the cross. Another flag, represented in a work of the time and called "the flag of the New England Colonies," had a dark-blue field with the cross on a white field in the corner; while, in place of the pine-tree, a half-globe was represented.

These various departures from the English flag, assuming standards of their own, indicate a growing feeling of independence among the colonies; while the absence of a desire for a separation from the mother-country is evident in the acknowledgment of allegiance implied by representing on them the colors of England; or, when from tenderness of conscience these were left out, the arms of the king. By act of Parliament, January 16, 1707, ratifying the treaty of the union of the two kingdoms of England and Scotland, it was ordained "that the ensign armorial of our Kingdom of Great Britain" should be "the crosses of St. George and St. Andrew conjoined" (the same as heretofore described as the "King's Colors"); to be "used in all flags, banners, standards, and ensigns, both at sea and land," and "the ensign described on the margent hereof (the crosses conjoined in the corner of a crimson banner) to be worn on board of all ships or vessels belonging to any of our subjects whatsoever." These flags were known familiarly as "Union Flags," typifying the union of England and Scotland, and were generally used by the colonies till their rupture with the mother-country.

The necessity for union which then existed among the different colonies led to the adoption of badges and flags; and we find this sentiment plainly represented in many of them.

A committee of conference, consisting of Dr. Franklin, Mr. Lynch, and Mr. Harrison, was appointed by the Continental Congress to consider the subject of a proper flag. It assembled at the American camp at Cambridge, and on the first day of January, 1776, in honor of the organization of the new army, was first displayed the flag of the United Colonies. It was composed of seven red and six white stripes, with the red and white crosses of St. George and St. Andrew conjoined, on a blue field in the corner, denoting the union of the colonies, while acknowledging their continued allegiance to Great

Britain, and was named "The Great Union Flag."

This was the basis of our present national colors.

In the mean time, various flags had been adopted by different colonies or bodies of troops assembled to resist the aggressions of the mother-country. For the Connecticut troops in 1775, was prescribed "one standard for each regiment, to be distinguished by their color; for the seventh, blue; for the eighth, orange, etc." Upon these standards were represented the colony arms, with the motto, "Qui transtulit sustinet" ("He who transplanted us will sustain us"), round it in letters of gold. The flag displayed by Gen. Putnam on Prospect Hill, July 18, 1775, is described as a red flag bearing the motto of Connecticut, "Qui transtulit sustinet," on one side, and on the other "An appeal to Heaven." The flag of the floating-batteries had "a white ground, a tree in the middle, and the motto, 'Appeal to Heaven.'" Trumbull, in his celebrated picture of the battle of Bunker's Hill, has represented our troops as displaying a flag combining the two last mentioned,—a red flag with the pine-tree on a white field in the corner,—and such a flag was probably used in that battle.

The first American flag displayed in South Carolina was at the taking of Fort Johnson by Col. Moultrie, September 13, 1775, described as a large blue flag with a crescent in one corner.

In many of the camps red flags were used.

But these various banners were all supplanted by the "Great Union Flag."

For use in their infant navy, other flags were also appointed. On February 9, 1776, Col. Gadsden presented to Congress a standard to be used by the American navy, representing, in a yellow field, a rattlesnake of thirteen rattles, coiled to strike, and the motto, "Don't tread on me."

The device of a rattlesnake was a favorite one with the colonists at this period, and was frequently adopted as a heading by many of the newspapers of the day; being represented divided into thirteen parts, with the initial of one of the colonies in each part, and accompanied by the motto, "Join or die."

The Massachusetts Provincial Congress adopted a flag to be used by the cruisers of the colony of Massachusetts,—a white flag with a green pine-tree, and the inscription, "Appeal to Heaven"; being the same flag as that used on the floating-batteries and before described. The "Great Union Flag," without the crosses, and sometimes with a representation of a rattlesnake, and the motto "Don't tread on me," was also used as a naval flag, and denominated "the Continental Flag."

During the war of the Revolution, flags with significant and appropriate devices were occasionally adopted and borne by some of the corps; many of which, by the valor of the corps to which they belonged, have become historic. Such was the flag of the "Culpepper Minute-Men," who assembled in obedience to the call of Patrick Henry, upon which was represented a rattlesnake and the mottoes "Don't tread on me," "Liberty or Death," and the name of the corps, "Culpepper Minute-Men." Such, also, was the flag of the "Morgan Rifles," which bore upon its field the date "1776," surrounded by a wreath of laurel, the inscription "XI. Virginia Regiment," and the words "Morgan Rifle Corps." And the Pulaski banner, prepared by the nuns of Bethlehem, and sent to Count Pulaski "with their blessing," while he was organizing a corps of cavalry in Baltimore; this was of crimson silk, emblazoned with emblems wrought with the needle by their own hands. The Life-Guard of Washington bore a banner of white silk, with devices, and the motto of the corps, "Conquer or die," painted upon the field.

The "Great Union Flag," however, which was first unfurled on the 1st of January, 1776, over the new Continental army at Cambridge, consisting of but 9659 men, was used as the banner *par excellence* of the United Colonies.

A standard for the United States was not adopted till some months after the Declaration of Independence. Congress, on the 14th of June, 1777, passed the following resolution, which, however, was not made public till September 3 of the same year: "Resolved, that the flag of the thirteen United States be thirteen stripes, alternate red and white, that the union be thirteen stars, white in a blue field, representing a new constellation."

The new constellation which it was intended should be represented is supposed to be Lyra, which in ancient times was the symbol of harmony and unity among men. The difficulty of representing a constellation on a standard probably led to a modification of the plan, and a *circle* of thirteen stars was chosen, signifying union and eternal endurance. Red is an emblem of courage and fortitude; white, purity; and blue, constancy, love, and faith.

This flag was used at the surrender of Burgoyne, October 17, 1777.

The first change in this flag was in 1794, when it was enacted by Congress in the following resolution: "That from and after the first day of May, Anno Domini one thousand seven hundred and ninety-five, the flag of the United States be fifteen stripes, alternate red and white. That the union be fifteen stars, white in a blue field." Approved January 13, 1794.

The next change was in 1818, the resolution of Congress being as follows: "That, from and after the fourth day of July next, the flag of the United States be thirteen horizontal stripes, alternate red and white; that the union be twenty stars, white on a blue field; and that, on the admission of a new State into the union, one star be added to the union of the flag; and that such addition shall take effect on the fourth day of July next succeeding such admission." Approved April 4, 1818.

Flags are also used as distinguishing marks of the flag-ships of admirals, vice- and rear-admirals; they are of blue bunting, are worn at the main, fore, or mizzen, and contain four, three, or two stars, according to the grade of the officer. When two or more flag-officers of the same grade are in company, the senior flies the blue, the next in rank the red, and the others the white flag. The distinctive flag of the Secretary of the Navy is worn at the main of the vessel in which he is embarked. When the President is on board a man-of-war, the fact is denoted by the hoisting of the national colors at the main.

Flags are also used for signaling. (See SIGNALS.) Those which are hoisted at the yard-arms or mast-heads are made of some light rough

material, as bunting, that a very light breeze may cause them to blow out; those which are made use of in signaling by hand are made of some light smooth material, which offers little resistance to the passage of the flag through the air. A black flag is usually adopted by pirates; a white flag is shown as a token of surrender or as a flag of truce (which see); a red flag is hoisted when powder is being received or discharged, and it is also shown as a defiance; a yellow flag is hoisted at the fore when there is any infectious disease on board, being used by all civilized nations as a quarantine flag. *To hang out the white flag*, to call for quarter, or to indicate friendly intentions. *To hang out a red flag*, to give a signal of defiance. *To lower* or *strike the flag*, to haul it down as a token of submission. *To flag*, to send a signal-message by means of a hand-flag.

FLAG-CAPTAIN. The commanding officer of a flag-ship.

FLAG-LIEUTENANT. A term for an aid to the commander-in-chief.

FLAGMAN. A man who handles a hand-flag in signaling.

FLAG-OFFICER. An admiral, vice-admiral, rear-admiral, or commodore.

FLAG OF TRUCE. A white flag which is shown to denote a desire to communicate with the enemy. A flag of truce is, in its nature, of a sacred character; and the use of it to obtain knowledge or information surreptitiously against the interests or wishes of an enemy is to abuse it, and will subject the bearer to punishment as a spy. The senior officer present is alone authorized to dispatch or to admit communication by a flag of truce. Flags of truce should never be permitted to approach sufficiently near to acquire useful information. The firing of a gun is generally understood as a warning not to approach nearer. On the water, a flag of truce should be met at a suitable distance by a boat from the senior officer's vessel, in charge of a commissioned officer, having a white flag plainly displayed from the time of leaving until her return. In dispatching a flag of truce the same precautions are to be observed. When a flag of truce is admitted, the ensign is always to be hoisted and a white flag at the fore on board the vessel of the senior officer present when no engagement is in progress, and kept flying until the flag of truce from the enemy has returned within his lines. A flag of truce cannot insist on being admitted, and should rarely be used during an engagement; if then admitted, there is no breach of faith in retaining it. Firing is not necessarily to cease on the appearance of a flag of truce during an engagement, and should any person connected with it be killed, no complaint can be made. If, however, the white flag should be exhibited as a token of submission, firing is to cease. See TRUCE.

FLAG-SHARE. The commander-in-chief's share of the prize-money awarded to all vessels making captures within the limits of his command.

FLAG-SHIP. A vessel flying the distinctive flag of an admiral or the broad-pennant of a commodore.

Flake. A swinging stage hung over the stern.

Flam. A puff of wind. A shallow spot.

Flam-few. The glimmer of the moon on the water.

Flan. A sudden flaw of wind from the land.

Flanche. To belly out; to flare.

Flange. In mechanism, projecting parts by which one portion of a machine or structure is bolted or riveted to another; as, flanges of pipes, columns, cylinder-heads, boiler-plates, etc. Flanges may project either externally or internally.

A projecting rim of a wheel, as applied to railway locomotive or car-wheels to constrain them to the track.

Flap. The cover of a cartridge-box. The violent motion of a sail, caused by the wind or the rolling of the vessel.

Flare. The skate, *Raia batis.* To project beyond the perpendicular; opposed to *tumble home.*

Flash. In timber, the marks of the grain. A river opening into a bay, separated from the sea by a reef of rock. A canal at the side of a river, arranged so as to pour its waters into it, and thus shoot boats over falls. To burn loose powder, producing flame but no noise. *Flash in the pan*, to miss fire; to fail; an unsuccessful attempt. *To make a flash*, to shoot a boat over rapids by a flash.

FLASHING LIGHT. See LIGHTS.

FLASHING SIGNALS. See SIGNALS.

FLASH-RIM. A cup-shaped enlargement of the bore of carronades, facilitating loading, and preserving the rigging from flame.

FLASH SHIP. A ship all paint outside and disorder within; a showy but not efficient vessel.

Flask. A horn, leather, or metal implement, for holding powder. Priming-flasks are supplied to prime guns for salutes in the navy. A box to contain a mold for castings.

Flat. Horizontal; level. A straight part in a curve. A bank over which the tide flows; if of less than 3 fathoms it is called a shoal, shallow, or bar. A flat-bottomed lighter. The position of a sail when the yard is sharp up, the sheets close home, and the halliards taut up, or, in other words, when it lies as nearly as possible in the direction of the keel. A sheet is *flat aft* when it is hauled as much as possible in the direction of the keel,—applied to fore-and-aft sails. *Flat aback*, see ABACK.

FLAT-BOTTOMED. Having little rise in floor timbers; flat-floored.

FLAT-CALM. See DEAD-CALM.

FLAT-FISH. Sole, turbot, etc., which swim on one side, and have the eye in the upper side.

FLAT-FLOORED. Having the bottom timbers lying nearly in a plane perpendicular to the plane of the keel.

FLAT NAILS. Sharp flat-headed nails used in the mold-loft.

FLAT-SEAM. When two edges of canvas are overlapped, and thus sewed together, it is called a *flat-seam.*

FLAT SEIZING. A seizing with no riding turns.

FLAT SENNIT. See SENNIT.

FLATTEN-IN. To haul the sail as nearly fore and aft as may be to produce only its lateral effect. Head-sails are flattened-in to pay the ship's bow off, or turn it from the wind.

Flaut. See FLUTE.

Flaw. A defect in wood, metal, etc. A puff of wind.

Fleak. See DUTCH PLAICE.

Fleate. To skim fresh water off the sea near the mouths of rivers.

Flechera. A fast dispatch-boat used in South American waters.

Fleech. A slab-cut of timber.

Fleet. To pass over quickly; to skim over the water. To shift from one place to another. To pull the blocks of a tackle farther apart. "*Fleet ho!*" "Let go and shift!" said when the blocks come together, rendering it necessary to pull them apart. To shift the turns of a rope farther down on the capstan. *Fleet the messenger*, to shift the eyes past the capstan. An arm of the sea where the tide flows. A bay where vessels can anchor. A shallow tidal creek. The whole naval force of a country. A collection of ships, either war or merchant. A fleet is divided into divisions and squadrons, the centre being under the commander-in-chief, and the van and rear under subordinates. The admiral, vice- and rear-admiral occupy these posts when at sea. A small fleet is called a flotilla, and the same name designates a large fleet of small vessels or boats. Fleets of great size were early used. The Persians first assembled great numbers of ships, and the Carthaginians and Romans counted them by hundreds. The Danes and Normans, in their early incursions, had from 200 to 600 vessels, and William the Conqueror came to England with 1000 vessels. In the early naval history of England from 200 to 500 ships sailed together, and they collected more than 1000 vessels during the early wars with France; on several occasions Louis IX. of France had 1700 vessels,—on his expedition to the Holy Land. The Great Armada consisted of only 150 vessels, varying from 300 to 1200 tons. During the Dutch and English naval wars, and the French and English wars, fleets of nearly a hundred ships of the line, and sometimes more, were common. With a great increase in the size and cost of ships, and greater individual power of each, large fleets will be the exception in the future. A designation of the divisions of the cruising navy of the United States, as the European Fleet, the North Atlantic Fleet, the Pacific Fleet, and the Asiatic Fleet. *Squadron* is also here employed.

FLEET-CAPTAIN. The senior aid of the admiral of a fleet, when a captain. See CHIEF-OF-STAFF.

FLEET-GIG. The gig of the fleet-captain.

FLEET-PAYMASTER, -SURGEON, -ENGINEER, and MARINE OFFICER. The ranking officers of those corps attached to the staff.

FLEET-TACTICS. See NAVAL TACTICS.

FLEET-WATER (*Eng.*). Water that overflows the land.

Flemish. To coil down a rope in concentric coils, closely pressed together. See FAKE.

Flemish Accounts. Short or deficient accounts.

Flemish Eye. See EYE, FLEMISH.

Flemish Fake. A fake or coil of rope in which the separate turns are concentric, and lie flat on the deck, without riding over each other.

Flemish Horse. The outer or short foot-rope of a yard. It is spliced around a thimble at the yard-arm, and has the other end seized to the yard some distance inside.

Flench-gut. Long slices of whale's blubber.

Flense. To strip off the blubber of a whale.

Flesh. *To flesh a sword*, to use it in action the first time.

Flesh-traffic. The slave-trade.

Flibot. See FLY-BOAT.

Flibustier (*Fr.*). See FILIBUSTER.

Flicker. To veer about; as the wind.

Flidder. The limpet (*Ancylus*).

Flighers. An old law-term for masts.

Flight. A Dutch canal-boat for passengers. A sudden rise in the lines of a ship. The passage of a projectile through the air.

Flinch. See FLENSE.

FLINCH-GUT. See FLENCH-GUT.

Flinders. Splinters of wood.

Flint. Stone to strike fire with,—provided to boats and for the galley. Matches are forbidden on board ship.

Flip. A drink composed of beer, spirits, and sugar.

Flipper. A fin; the hand.

Flitch. The outside cut of a tree or log.

Flittering. Old English for floating.

Flizzing. Flight of a splinter through the air,—from the Dutch *flissen*, to fly.

Float. A place or basin where vessels float. Inner part of a ship-channel. In wet-docks, the basin where the water is maintained at one level by locks. A raft of timber, boxes, or barrels. A camel or floating-stage. The paddle of a paddle-wheel. Any buoyant body used to constrain another body in a constant relative position to the surface of a liquid. To swim on the surface of the water.

FLOATAGE. Same as flotsam (which see).

FLOAT-BOARDS. The boards fastened radially on the rim of a paddle-wheel.

FLOATING ANCHOR. A sea-anchor.

FLOATING BATTERY. A vessel constructed to float in smooth water, carrying a heavy battery, and strongly protected by plating. A vessel used as a battery to support the landing of troops. The first use of a floating battery is traced far back into antiquity, when two or more galleys were united, with catapults, battering-rams, etc., on their decks, to attack towns. The Knights of St. John, at Malta, first protected a battery with metal, using lead, in 1530. In modern times, the floating batteries used at Gibraltar in 1779–83 are first met with. These were ten in number, and were protected with timber, junk, and hides. In 1855 the French constructed floating batteries at Kinburn, in the Crimea, and these were effective, and some still remain in use. Four of them are of 280 tons and carry two 5½-inch guns, and one is of 140 tons, carrying two 6-inch guns. Spain has two,—the "Duque de Tetuan" and the "Puigcerda." Many modern armored vessels are simply floating batteries with motive-power.

FLOATING BETHEL. An old ship fitted up as a chapel.

FLOATING BREAKWATER. A system of anchored cribs, serving to break the force of waves.

FLOATING BRIDGE. A bridge of boats. A ferry-boat, running on chains laid in a narrow channel.

FLOATING COFFIN. A name for a vessel which is considered unseaworthy, particularly applied to our monitors and old brigs, the old English 10-gun brigs, and to the very long passenger steamers engaged in the transatlantic trade.

FLOATING DAM. The caisson of a dry-dock.

FLOATING DERRICK. The application of the Bishop's derrick to a large scow of such a capacity as to handle the heaviest weights, such as the boiler of a steamship, and which is also fitted with a sufficient steam-power, in order that the scow and weight appended can be transported from one place to another in a harbor. It is useful also in many other ways.

FLOATING DOCK. A dock built for the repairs of ships, which is floating instead of being formed by excavations. There are several kinds of floating docks, known as the sectional, balance, and hydraulic docks.

FLOATING LIGHT. A vessel moored off a shoal or rocks with a light at its mast-head. There are 25 light-ships on the coast of the United States, with 35 lights. A light erected on a buoy or floating-stage. Buoy-lights are now furnished with gas-tanks in the buoys, in some instances.

FLOATING PIER. A stage or camel floating on the water, rising and falling with the tide.

FLOAT-VALVE. A valve connected with a float so that it may be automatically opened, closed, or regulated according to a varying surface of a liquid.

Floe. A detached portion of an ice-field. See CALF.

Flog. To punish by striking with the cat-o'nine-tails. This punishment is now forbidden in our service, though quite common in some others, particularly the Russian. *To flog the glass*, to agitate and so hasten the flow of sand through it; sometimes practiced in early days by the midshipmen eager for their watch to be up.

Flome. An old word for a river or flood.

Flood. The flowing in of the tide. The rising tide, known as young flood, high flood, spring flood, half flood, etc. To overflow; to deluge with water; as, to flood the magazine. See TIDE.

FLOOD-ANCHOR. See ANCHOR.

FLOOD-COCKS. The cocks that are fixed in pipes leading from the ship's side below the water-line into the magazine, used to flood the latter in case of fire. These cocks are turned by levers from the deck.

FLOOD-MARK. A mark placed on the shore or a wharf at the highest tide; high-water mark. In England it marks the extent of Admiralty jurisdiction.

Flook, or Fluck. A flounder; a flat-fish.

Floor. All that part of a ship on either side of the keel which approaches nearer to a horizontal than to a perpendicular direction.

FLOOR-HEADS. The outer ends of the floor-timbers.

FLOOR-PLAN. A plan of the floors or bottom timbers of the ship, upon the drawings of the ship, or the mold-loft floor.

FLOOR-RIBBAND. The ribband next below the floor-heads.

FLOOR-SWEEPS. Radii that sweep the heads of the floors. It is an old method of construction, not used nowadays.

FLOOR-TIMBERS. The lower timbers of the frame of a ship placed square across the keel, and which are consequently thoroughly secured to the keel.

Flory-boat. A small boat used to carry passengers from steamers to the shore.

Flosh. A weedy marsh on the sea-shore.

Flosk. The sea-sleeve, anker-fish, cuttle-fish, or squid (*Sepia loligo*).

Flota. The fleet of Spanish galleys that yearly sailed to Mexico in the 17th century.

Flota Navium. An old term for *fleet*.

Flote. An old term for *wave*.

FLOTE-BOTE. An old term for a yawl or row-boat.

Flotilla. A fleet of small vessels.

Flot-mann. A very old term for a sailor.

FLOTSAM, or FLOTSON (*Law*). Goods floating on the sea, as distinguished from *jetsam*, or goods thrown into the sea, and which, sinking, remain under water; and also from *ligan*, those cast into the sea and buoyed. In olden times, such goods belonged to the finder; later, they were the property of the sovereign; at present, salvage or wreckage is allowed on them.

Flounder. The flat-fish (*Platessa flessus*); called also *floun-dab*.

Flow. To move in a steady stream. The rising of the tide. The current of a river. The direction or set of a current. *To flow the head-sheets*, to ease them off so the wind will have no effect on the head-sails.

FLOWING. The position of a sheet when it is eased off.

Flower of the Winds. The old compass painted on charts, a rose or lily being drawn in its centre.

Flowering. The shoals or strata of fish-feed, often seen in the water about spawning-time.

Flowing Hope. See FORLORN HOPE.

Flue. The fluke of an anchor. A passage for distributing the gaseous products of combustion of a furnace, or conveying them to a chimney. In steam-boilers, metallic flues surrounded by water constitute the larger portion of the fire or heating surface. Small cylindrical metallic flues are called tubes.

FLUE-BOILER. A steam-boiler in which the fire or heating surface is chiefly in flues instead of tubes.

FLUE-SURFACE. The aggregate surface of flues exposed to heat.

Fluffit. The movement of the fins of a fish.

Fluid Compass. See COMPASS.

Fluke. The large triangular tail of the whale. The triangular blade at the end of the anchor-arms, that forms a holding surface when the anchor is down. See ANCHOR.

Flummery. A dish of oat-meal.

Flurry. The movements of a dying whale. A light breeze of wind, agitating the surface of the sea. Haste and confusion.

Flush. Even; level. Well provided with money.

FLUSH DECK. A deck extending from stem to stern without a break.

Flustered. Excited or worried.

Flute, or Fluyt. A pink-rigged fly-boat, the after-part of which is round-ribbed. *Armed en flûte*, partially armed.

Flute-mouth. A fish of the genus *Fistularidæ*, with a snout drawn out into a tube.

Fluvial. Belonging to a river.

FLUVIAL LAGOON. A shallow lagoon, formed on the sea-coast by the action of a river.

FLUVIO-MARINE. The combined action of river and sea.

Flux. The coming in of the tide. In chemistry and metallurgy, any substance or mixture used to promote the fusion of metals or min-

erals, as alkalies, borax, etc. In large operations, limestone is extensively used. The action of a flux is to combine with the more refractory or infusible components of an ore or mineral, leaving the pure metal alone exposed to the action of the heat, as in smelting silicious iron ores with lime flux, where the infusible lime combines with the silica, forming "slag," which separates from the metal.

Fly. In mechanism, a contrivance for resisting acceleration or retardation of movement in a machine when the ratio between the motive force and the resistance to be overcome in performing work is variable. When used to prevent accelerated motion only, as when the motive force is a descending weight or released spring acting against a nearly constant resistance, a fly consists of two or more radial arms, fixed to a rapidly revolving spindle or shaft so as to revolve with it, to the ends of which are attached thin vanes or plates presenting their flat surfaces to the resistance of the atmosphere or other fluid. This device is familiar in striking-clocks and certain automatic musical instruments. When used to prevent fluctuations of speed arising from an alternately varying ratio between force applied and resistance to be overcome, weights are substituted for vanes, which, by their moment of inertia, absorb the energy of acceleration when the motive force exceeds the resistance, and yield it when the resistance exceeds the force. The part of a flag from the union to the extreme end. The compass-card. To move quickly or suddenly; as, to *fly* up into the wind. To float in the wind; as, a flag at the mast-head. *To let fly*, to let go; as, to let fly the sheets. *To fly about*, to chop about.

FLY-AWAY, CAPE. See CAPE FLY-AWAY.

FLY-BLOCK. The upper block of the topsail halliards.

FLY-BY-NIGHT. A square-sail, set like a stun'sail, used by sloops before the wind. A jib used as a stun'sail, extending from the topmast head.

FLYER. A clipper. A fast sailer.

FLY-GOVERNOR. A governor in which uniformity of motion is secured by means of fly-vanes. See GOVERNOR.

FLYING DUTCHMAN. A traditional spectre-ship, seen near the Cape of Good Hope. The legends are numerous, but owe their origin to a tale of a Dutch skipper, who, baffled long by head winds, swore he would double the cape in spite of God and man. Thenceforth his ship sailed without chart or compass, and is seen in all weathers, sometimes with little sail in a calm, sometimes with all sail in a tempest. Sailors also ascribe to its influence white squalls, shipwrecks, and other disasters. Sometimes it visits passing ships, when wine sours, and other disasters happen. Sometimes mail is sent from it, when the unlucky ship is never again heard from. His appearance constantly changes, so that he is never recognizable. His crew is composed of the spirits of old thieves, skulkers, and other outcasts from ships. Many other legends are connected with the famous Hollander, and the theme has furnished literature and music with much material.

FLYING FISH. Fish of the genus *Scombere-socidæ*, or *Sclerogenidæ*, whose pectoral fins are prolonged into a species of wings, smooth-edged, and which jump out of the water long distances. Sometimes the name is applied to the flying gurnard.

FLYING GURNARD. A fish of the genus *Dactylopterus*. These resemble flying fish, but their wing-bones are prolonged beyond the membranes, and they have a spine on the head. Both these and flying fish are edible, and abound in tropical waters.

FLYING JIB. The outermost jib, or sail, on the bowsprit, used as a jib to turn the ship's head. It is generally taken in and set with royals, is one of the light sails, and sets on a stay leading to the fore-topgallant mast-head, through the boom end. For the gear of the flying jib see under proper heads.

FLYING JIB-BOOM. The light boom which extends beyond the jib-boom. It is an outrigger for the stay, and lies along the jib-boom for half of its length, being secured by a belly-lashing to it, and by a heel-clamp to the bowsprit-cap, while it passes through a wythe on the boom end. For the rigging of the jib-boom see under proper heads.

FLYING KITES. Those lofty sails, now obsolete, formerly carried above the royals; as sky-sails, moon-sails, star-gazers, etc.

FLYING LIGHT. The state of a ship when she has little cargo, and is light in draft.

FLYING PROA. A kind of double canoe of the Ladrone Islands. The lee side is flat, keeping the craft up to the wind in the same manner as a lee-board or centre-board. A smaller canoe is attached to an outrigger rigged out to windward; when the wind freshens a man is sent out on the outrigger. It carries an enormous triangular sail, and sails very close to the wind, to which it always presents the rounded side. It is very light, being held together with coir yarns.

FLYING SQUID. The genus of *Cephalapod* fish called *Ommastrephes*. It sometimes jumps high out of the water.

FLYING STUN'SAIL. A stun'sail set flying, between the masts.

FLY-WHEEL. A wheel with a heavy rim, which, by its great moment of inertia, accumulates the energy of acceleration, and yields it when motion is retarded, as in equalizing the motion of a crank, or overcoming the resistance of suddenly applied work, as in rolling-mills.

Foam. Froth produced by agitating the waves, or arresting their motion. A liquid holding such a quantity of vapor or gas in suspension as to cause it to form a mass of small bubbles.

FOAM-COCK. A cock to blow off the foam.

FOAMING. In steam-enginery, a condition of the water in a boiler when in a state of foam. The principal causes of this condition are impurities in the water, which are either very volatile or tend to make it viscid, or a higher temperature of the water than is due to the steam-pressure. The latter state may result from temporarily drawing the steam from the boiler more rapidly than it can be formed at the proper temperature and pressure. Foaming endangers both boiler and engine; the former, because the true water-level cannot be ascertained, and the latter, because the water is carried bodily into the cylinder, producing destructive shocks.

Focal Distance. The distance between the object-glass and the image.

Fœnus Nauticum. Usury or bottomry.

Fog. Watery vapor, precipitated in the lower atmosphere, causing a mist or obscurity. Fogs are produced by the rapid cooling of the atmosphere near the earth, causing it to part with its moisture. They are common near banks where currents meet, and hover about the banks of the Gulf Stream. In northern latitudes they are very prevalent. Dry fogs, or dust-clouds, are also met with on the coast of Africa. Fog is generally a sign of good weather.

FOG-ALARM. An audible signal to warn vessels from rocks, shoals, or other dangerous places. The sound is made by a bell, trumpet, or whistle, and the apparatus may be worked by the heaving of the sea, by the effect of the tide or current, or by machinery. A notable fog-alarm was the bell on the Inchcape rock; the clapper was moved by the action of the waves.

FOG-BANK. A dense fog lying in a cloud or bank about the horizon. Lying at the water's edge it resembles land, and has led to those illusive appearances called Dutchman's land, Cape Fly-away, No-man's land, Butter-land, etc.

FOG-BELL. A bell rung to warn ships during fogs. When ships are at anchor a bell is thus rung. Bells are placed on buoys or on frame- or iron-work at sea in the vicinity of shoals to warn ships. Some are arranged to toll automatically by the motion of the waves, tide, or winds. A bell is also sometimes erected, connected with machinery, near a light-house on shore, to ring in case of fog.

FOG-BOW. A bow formed in high latitudes opposite the sun, sometimes white, sometimes prismatic in colors. It is caused by refraction, and is said to indicate the clearing away of fogs.

FOG-DOG. A clearing spot in a fog, or a break in the bank, presaging the lifting of the fog.

FOG-EATER. Much the same as fog-bow and fog-dog, and including both. A break in a fog-bank or mist, a sign of clearing weather.

FOGGY. Abounding with fog. Obscure; beclouded. Half drunk.

FOG-HORN. A horn for making fog-signals.

FOG-RING. A circular bank of fog.

FOG-SIGNAL. A signal made during fog to warn ships from each other's path, or of dangers, such as rocks and shoals. Ships at anchor generally use a bell, and this is used also in other cases. (See FOG-BELL.) Sailing-ships under way use a horn. Automatic horns have been devised, either causing the sound by a motion communicated by the hand, or by the rolling of the ship. Steamers under way use a steam-whistle. More effective signals are desirable, but have not yet been adopted. On shore, besides a bell, a gun has been used, a steam-whistle, and a *siren*, where the sound is caused by blowing air or steam through revolving disks in which holes are cut. Buoys off shore have in many instances automatic fog-whistles attached to them. On the coast of the United States there are 54 fog-signals, 16 of them duplicates. Many of those on the light-vessels are worked by caloric-engines.

FOG-WHISTLE. See FOG-SIGNAL.

Fogram. Liquor of indifferent quality.

Fogy. An old-fashioned person. An increase of pay due to length of service.

Foil. A slender, blunt sword used in fencing.

Folder. The folding sight of a fire-arm.

Folding Boat. A boat made of frame-work and canvas, so as to be folded up into a small bundle.

Follis. A large-meshed net.

Followers (*Eng.*). A captain or flag-officer's servants and boat's crew. Young midshipmen formerly going with the captain from ship to ship.

Fomalhaut. The bright star *a Piscis Australis.* See PISCIS AUSTRALIS.

Foo-Choo. One of the treaty-ports and a large city of China, capital of the province of Fo-Kien, on the Min River, 25 miles from its mouth. Lat. 26° 12′ 24″ N.; lon. 119° 30′ E. It is surrounded by an amphitheatre of hills about 4 miles distant, and is inclosed by a castellated wall 9 or 10 miles in circumference. The whole is commanded by a fortified hill 500 feet above the plain, and inside of the walls is another height crowned by a conspicuous watch-tower. Foo-Choo has a naval arsenal, ship-yards, and a school of navigation. Pop. 500,000.

Foolen (*Eng.*). The space between the high-water mark and the foot of the wall on the banks of a river.

Fool-fish. The long-finned file-fish of the genus *Balistes.*

Foolish Guillemot. The diving-bird, *Uria troile.*

Foot. A linear measure of 12 inches; the foot varies in different countries from 21.022 centimetres to 50 centimetres in length. The lower edge of a sail. *To foot*, to push with the feet; as, to *foot* the fore-sheet clear of the backstays.

FOOT-BOARD. A small board in skiffs, to serve as a stretcher for the foot of the rower. A gang-board.

FOOT-BOAT. A small boat used to carry foot-passengers.

FOOT-BRAIL. See BRAIL.

FOOT-CLEW. The clew at the foot of a hammock.

FOOT-HOOK. Same as futtock (which see).

FOOTING. The fine which a landsman has to pay on first going aloft.

FOOT-POUND. The unit of measure of work, which is a resistance of one pound moved through a space of one foot. See WORK.

FOOT-ROPE. The roping on the foot of a sail. The rope extending under a yard, from near the end to the slings, or middle, for the men to stand on. It is also used on the jib- and flying jib-booms, and on the spanker-boom. They were formerly called horses, and are still supported at intervals along the yard by the stirrups.

FOOT-VALVE. A valve placed between the condenser and air-pump of a steam-engine, and through which the products of condensation are drawn.

Foote, Andrew Hull, Rear-Admiral U.S.N. Son of Gov. S. A. Foote. Born in New Haven, Conn., September 12, 1806; died in New York City, June 26, 1863. Acting midshipman in 1822, he made his first cruise in the schooner "Grampus," sent in 1823 to chastise the West Indian pirates. Lieutenant, May 27, 1830; commander, December 19, 1852. He was flag-lieutenant in 1833 of the Mediterranean Squadron; and in 1838, as first lieutenant of the "John Adams," Commodore Read, circumnavigated the globe, and took part in an attack on the pirates of Sumatra. While stationed at the Naval Asylum,

in 1841–43, he prevailed upon many of the inmates to give up their spirit rations, being one of the first to introduce the principle of total abstinence from intoxicating drinks in the navy, and continued this effort in the "Cumberland," in 1843–45, besides delivering an extemporaneous sermon every Sunday to the crew. In 1849–52, in command of the brig "Perry," he was on the African coast, successfully engaged in suppressing the slave-trade. He published in 1854 "Africa, and the American Flag." He commanded in 1856 the sloop "Portsmouth" on the China station. Arriving at Canton just before the commencement of hostilities between the English and Chinese, he exerted himself in protecting American property, and having been, while thus engaged, fired upon by the Barrier Forts, received permission from Commodore Armstrong to demand an apology for this indignity. This being refused, he attacked the forts, four in number, with the "Portsmouth" and "Levant," breached the largest, and, with 280 sailors, landed and carried it by storm. The remaining forts were successfully carried, with a total loss of 40 to the attacking party. The works were of granite, with walls 7 feet thick, mounting 176 guns, and garrisoned by 5000 men, 400 of whom were killed and wounded. In July, 1861, he became captain, and in September flag-officer of the flotilla fitting out in the Western waters. February 4, 1862, he sailed from Cairo with seven gunboats, four of them ironclads, to attack Fort Henry, on the Tennessee River. Without awaiting the co-operation of Gen. Grant, he attacked the fort at noon of the 6th, and in two hours compelled its surrender. On the 14th he attacked Fort Donelson; but the fleet was obliged to haul off just as the enemy's water-batteries had been silenced, two of the gunboats having become unmanageable. Foote was severely wounded in the ankle by a fragment of a 64-pound shot. Though on crutches, he proceeded down the Mississippi with his fleet and a number of mortar-boats to besiege Island No. 10. After its reduction, April 7, he returned to New Haven. Regaining his health, he was made chief of the Bureau of Equipment and Recruiting. July 31, 1862, he was appointed rear-admiral on the active list. On Admiral Dupont's being relieved from his command of the South Atlantic Blockading Squadron, May, 1863, Admiral Foote was appointed to succeed him.

Forbin, Claude (Chevalier, and afterwards Count de), a very celebrated French sailor, was born near Aix, in Provence, in August, 1656, and died at Saint Marcel, near Marseilles, on the 4th of March, 1735. His name has often been confounded with two others of the same family who bore the title of chevalier,—one of whom was his uncle.

The Count de Forbin wrote his own memoirs,—almost the exception in the case of French seamen of the period,—the other one who has given us his life being Duguay-Trouin. Forbin most unjustly abuses his contemporaries,—even Jean Bart and Duguay-Trouin,—but, with that exception, his "Memoirs" are both amusing and instructive.

From Forbin's own showing it appears that, from extreme youth to the age of nineteen he was involved in every species of dissipation, debt, gambling, and, moreover, a great duelist.

In 1675 he entered the galley service as a "standard bearer," making several cruises. This grade being suppressed in 1676, Forbin entered the land service, in a corps of musqueteers, commanded by a relative, and made a campaign in Flanders.

In 1677 he re-entered the marine, as *ensiegne de vaisseau.* He soon lost his commission, however, and was even condemned to decapitation, for having killed another officer in a duel. After a time he was pardoned for this offense, and actually contrived to again enter the navy, as an *enseigne de vaisseau*, by substituting himself for a brother whom he much resembled, and who was prevented, by ill health, from going to sea.

In 1680, Forbin served with D'Estrées in the West Indies, and in 1682–83, with Duquesne at the bombardments of Algiers. For his coolness and bravery on these occasions he was made *lieutenant de vaisseau.*

Two years later he was a member of the embassy sent to the King of Siam by Louis XIV., and the Eastern monarch was so pleased with Forbin that he retained him at his court, and made him admiral, and general in his army, besides bestowing upon him other high dignities. Forbin appears to have very soon got tired of it all, and obtaining leave, on account of his health, to go to the French colony of Pondicherry, he thence, without further ceremony, returned to France, where he appeared at court, and amused Louis XIV. with his descriptions of court-life in Siam.

In 1689, after the rupture of the peace of Nimeguen, Forbin re-entered active service, receiving a commission as *capitaine de frégate.* In this capacity he served under Jean Bart, and, forming part of the escort of a convoy, had a desperate fight with two English vessels of greater force. They were both captured, both made prisoners, and both made escapes remarkable for the endurance and intrepidity shown, and were both, as a reward, made *capitaines de vaisseau.* Forbin almost at once went to sea again, in a low, fast-sailing vessel called the "Marseillaise," and became a scourge to the commerce of the English. The year after, he commanded the "Fidèle," in the battles under Tourville, and afterwards cruised in the North Sea.

In 1692 he again served under Tourville at the disastrous battle of La Hogue, where he was most severely wounded in the knee, and his ship, "La Perle," was cut to pieces, and very nearly burnt by fire-ships. In spite of all this he succeeded in getting in to Saint Malo.

Having recovered from his wounds, Forbin next served under Jean Bart, in his celebrated cruise in the North Sea, where he inflicted such damage on the Dutch and English commerce.

In 1693 he served in the brilliant action off Lagos, where Tourville dispersed and ruined the great Smyrna fleet and its escort. Forbin here captured three ships and burnt a fourth. He continued constantly in service, both in the North Sea and in the Mediterranean, and as a reward for his services was, in 1699, made a Chevalier of St. Louis.

During the war of the Spanish Succession he had a separate command in the Adriatic, where he burnt Trieste, and so preyed upon Austrian commerce that the prayers of the Dalmatian

sailors, on going to sea, was that they might not encounter the Chevalier de Forbin.

In 1706–7 he took or destroyed, in the North Sea, more than 180 English and Dutch vessels, and was made *chef d'escadre* and count.

The next cruise he made was to the White Sea, and the result was the ruin of the fisheries for that season. In the same year, 1707, he came south with his squadron to join that of Duguay-Trouin, and, together, they fought a large English squadron. Owing to some misapprehension of orders, Forbin did not arrive in line until late in the day, which caused a drawn battle, although the English suffered most damage.

In 1708, Forbin was commissioned to conduct to Edinburgh the Pretender, the Chevalier St. George, son of James II. Forbin was much blamed for the non-success of the Pretender's venture, and, being already dissatisfied because he had not been made lieutenant-general of the marine, he abandoned the naval service, and settled down near Marseilles, where he died. He was a brave man, and a good sailor, but of unmeasured pride, and never made any personal friends. He was 77 when he died, and had served 40 years at sea.—*E. Shippen.*

For-by. Near; close at hand.

Force. A condition between two bodies tending to change their relative positions; its unit of measure is one pound avoirdupois. Strength; power; might. Violence; coercion. Strength or power for war; hence, a fleet or body of troops. To compel; to coerce.

FORCED-MEN. Men who are forced by pirates to serve with them, but who do not sign the articles.

FORCE-PUMP. A pump for forcing a fluid against a resisting pressure; as, the pumps of a fire-engine or the feed-pump of a steam-boiler.

FORCER. Piston of a force-pump.

Fore. The distinguishing characteristic of all that portion of a ship and appurtenances which lie near the stem; the opposite of *aft*, or *after*. *To the fore*, in advance. *At the fore*, at the fore-royal mast-head, said of a flag or set of flags.

FORE-AND-AFT. From stem to stern. In a line parallel to the keel.

FORE-AND-AFTER. A cocked hat worn with the peaks in front and behind. A vessel rigged with fore-and-aft sails only.

FORE-AND-AFT SAILS. Sails that are not bent to yards, but extend from the mast or stay to the lee side of the vessel. They include sails setting on stays, on masts, with gaffs, booms, sprits, and lateen-yards, and are divided into stay-sails (including jibs), trysails (including spanker), lateen-sails, lug-sails, sprit-sails, gaff-topsails, and shoulder-of-mutton sails. They allow the vessel to approach nearer to the wind, as they may be trimmed more nearly in a line with the keel than square-sails. Schooners, sloops, boats, and small craft generally use them, but they also make a part of the sail-rig of every vessel.

FORE-AND-AFT TACKLE. A tackle used in the line of the keel for any purpose.

FORE-BAY. The sick-bay. The galley-room on the spar-deck of merchantmen. The rise of a floor of a lock-gate. See SICK-BAY.

FORE-BODY. That portion of the vessel forward of dead-flat.

FORE-BOOM. An old name for the jib-boom. The boom of a fore-and-aft foresail.

FORE-CABIN. The forward cabin of a vessel.

FORECASTLE. That portion of the spar-deck from the after fore-shroud forward. The name arose from the structure resembling a castle which was formerly erected on the forward part of the spar-deck. A partial deck level with the rail at the forward part of the ship is called a *topgallant forecastle.*

FORECASTLE-AWNING. See AWNING.

FORECASTLE-DECK. The forward part of the upper deck.

FORECASTLE-JOKES. Sailors' practical jokes.

FORECASTLE-MEN. That part of the crew stationed on the forecastle, generally the oldest and most reliable seamen. They handle the head-sails, the foresail and lower studding-sail, work the anchor-gear, clean and keep the forward part of the ship in order, etc.

FORECASTLE-NETTINGS. That portion of the hammock-nettings on or near the forecastle.

FORE-COURSE. The sail bent to the fore-yard. See FORESAIL.

FORE-FOOT. The forward end of the keel.

FORE-GAFF. The gaff of the fore-trysail.

FORE-GANGER. A short piece of rope connecting the line with the harpoon.

FORE-GUY. See FORWARD GUY.

FORE-HATCH. The hatch nearest the foremast, generally abaft it, on all decks.

FORE-HOLD. The forward part of the hold. In it, in men-of-war, are stowed tar, pitch, rigging, anchor-gear, etc.

FORE-LEECH. The luff of a stay-sail or trysail.

FOREMAST. The mast nearest the bow. For the rigging of the foremast, see under proper heads.

FOREMAST HAND, or FOREMAST MAN. A blue-jacket not above the rating of seaman. The term may include all who are shipped "before the mast."

FORE MAST-MAN. A man stationed to attend to the gear of the foremast. See MAST-MAN.

FORE-ORLOP. The part of the ship next forward the hold, and under the berth-deck. On it, in frigates and large sloops, are the sail-rooms, etc.

FORE-PASSAGE. A gangway or passage on the fore-orlop-deck, leading to the *fore-peak.*

FORE-PEAK. That part of the hold in the extreme forward part of the ship, occupied by paint-room, yeoman's store-room, and a block-room in men-of-war.

FORE-RAKE. The part of the ship projecting over the forward end of the keel.

FORE-REACH. To shoot ahead after the propelling power has ceased. To gain ground ahead in tacking.

FORE-ROYAL. See ROYAL.

FORE-RUNNER. The piece of bunting inserted in a log-line, to mark the extent of stray-line, and the point at which the glass must be turned.

FORESAIL. A square-sail, bent to the fore-yard, the lowest on the foremast. The fore-and-aft sail on the foremast of a schooner. The fore-stay-sail of a cutter or sloop. For the gear of the foresail, see under proper heads. See SAILS.

FORE-SHEET HORSE. An iron bar fixed across the deck, for the clew of the fore-stay-sail to travel on.

FORE-SHEETS. The forward portion of a boat having a grating shipped over it. See STERN-SHEETS.

FORE-SHEET TRAVELER. An iron ring or triangle fitted to the clew of a fore-and-aft foresail, running on the horse, so as to traverse the sail.

FORE-SHIP. An old term for the fore part of a ship.

FORE-SPENCER. A name for the fore-trysail.

FORE-STAGE. An old name for the forecastle.

FORE-STAY-SAIL. The stay-sail just forward of the foremast, setting on the fore-stay. In men-of-war it has its own stay, and is only bent in bad weather, and is called the *fore storm-stay-sail.* See STAY-SAIL.

FORE STAY-TACKLE. See TRIATIC STAY.

FORE STUDDING-SAIL. See STUDDING-SAIL.

FORE-TOP. See TOP.

FORE-TOPGALLANT. See TOPGALLANT.

FORE-TOPMAST. See TOPMAST.

FORE-TRYSAIL. See TRYSAIL.

FORE-YARD. The lower yard across the foremast. For the rigging of the fore-yard, see under proper heads. See YARDS.

Forecast. Foresight; forethought. To foresee; to project.

Foreign-built. Built in a foreign country.

Foreland. An advanced headland, cape, or promontory forming the limit of a stretch of coast.

Fore-lock. A flat piece of iron, wedge-shaped, driven in a slit in the end of a bolt, so as to hold it in place. *A spring fore-lock* has a spring, keeping it in place.

FORE-LOCK BOLT. A bolt having a fore-lock attached to it.

Foreness. A peak or promontory.

Fore-staff. A nautical instrument for taking altitudes, now discarded. In the fore-staff, the eye was directed along the instrument to the object. In the back-staff, the image by reflection was used. See BACK-STAFF.

Forge Ahead. To shoot ahead after the sails are in, or steam is shut off. When hove-to, or lying-to, to gain distance ahead.

Forge-over. To force over a shoal or rock. To crowd sail or steam to get over a rock, etc.

Fork of a Stay. The place where a stay is divided into two parts, so as to embrace the mast.

Forkers (*Eng.*). People who reside near a navy-yard for the purpose of stealing, or receiving stolen goods.

Fork-tail. A salmon in its fourth year's growth.

Forlorn Hope. A term applied to a body of officers and men who volunteer, or are detailed, more generally the former, for some important and desperate undertaking in war, the extreme peril of which affords scant hope of safe deliverance, and correspondingly enhances the merit of the service. A contemplated enterprise of great danger and doubtful issue.

Former. A pattern for cartridges. A wad-mold.

Formicas. Chains of small rocks at the water's edge.

Fornax. See CONSTELLATION.

Forrest. French, Captain U.S.N. Born in Maryland in 1796; died in Georgetown, D. C., December 22, 1866. Midshipman, June 9, 1811; lieutenant, March 5, 1817; commander, February 9, 1837; captain, March 30, 1844; dismissed April 19, 1861. He fought bravely in the war of 1812, distinguishing himself in the battle on Lake Erie, and in the action between the "Hornet" and "Peacock," February 24, 1813, and in the Mexican war was adjutant-general of the land and naval forces. When Virginia seceded he was put at the head of the navy of Virginia; commander at the Norfolk Navy-Yard; was afterward commander of the James River squadron, and then Acting Assistant Secretary of the Confederate navy.

Fort-de-France. On the west coast of Martinique, French West Indies. Has a fine harbor, strong fortifications, a naval arsenal, and several hospitals. Pop. 13,300.

Forth. An arm of the sea.

Forty Thieves (*Eng.*). A name given to forty line-of-battle ships commenced in 1815, many of which never got to sea except as *razees.*

Forward. In the fore part. In advance of.

FORWARD-FIRE CARTRIDGE. A metallic cartridge, in which the fulminate is attached to the base of the shot, and fired by a pin running through the powder.

FORWARD GUY. A rope leading from the bowsprit through a block near the end of the lower or swinging-boom, then back through a block on the bowsprit, and in on deck. Any guy leading forward.

Fother. A weight of lead equal to 19½ cwt. Leaden pigs for ballast. To stop a leak by hauling under the bottom a sail closely thrummed with yarns and oakum, the pressure of the water forcing the sail into the aperture.

Foul. Not clear; entangled; jammed. Unclean; filthy. Unfavorable.

FOUL ANCHOR. See ANCHOR.

FOUL BERTH. A berth in which a ship is exposed to the danger of fouling, or of being fouled by, other ships.

FOUL BILL. See BILL OF HEALTH.

FOUL BOTTOM. A term applied to the bottom of a harbor where rocks or wrecks endanger the safety of vessels. The state of a ship's bottom when sea-weed, shells, etc., adhere to it.

FOUL COAST. A coast lined with reefs and breakers.

FOUL FISH. Fish during the spawning season.

FOUL GROUND. See FOUL BOTTOM.

FOUL HAWSE. The state of the hawse when the chains are so intertwined that neither anchor can be picked up without fouling. See HAWSE.

FOUL WEATHER. Wet, windy weather.

FOUL-WEATHER BREEDER. A name given to the Gulf Stream, which occasions great perturbations in the atmosphere. An oppressive state of the atmosphere presaging foul weather.

FOUL-WEATHER FLAG. A flag hoisted as a storm-signal.

FOUL WIND. A head wind; an unfavorable wind.

Founder. To fill with water and sink.

Four-cant. Four-stranded rope.

Fox. Two or more yarns laid up by hand; used for sennit, gaskets, mats, seizings, etc. *A Spanish fox* is a single yarn twisted up in a direction contrary to its original lay; used for small seizings.

Foyst. An old name for a brigantine. Early voyagers applied the name to large barks in India, which were probably *grabs.*

Frame Timbers. The several pieces which compose the frame of a ship, as the floor timbers, first, second, third, and fourth futtocks, and top timbers, which are united, having a proper shift or scarf with each other, and bolted together.

Frames. The timbers spoken of above after being united or bolted together securely. In iron construction it is the floor plate and its angle-irons, as well as the reverse angle-irons united in one rib, which when completed is called a *frame*.

France, Navy of. Although unfortunate in her encounters with the British during the latter part of the last and the commencement of the present century, France has always enjoyed a high reputation for the skill and bravery of her naval officers, and for their services in the cause of science and discovery. The names of D'Estaing, Villeneuve, La Perouse, La Bougainville, La Grasse, and Duquesne, embellish her historical pages, while the possessions which she still retains illustrate their conquests. The fluctuations in the government of the country during the past seven decades have more or less interrupted her progressive arrangements, but the elasticity of her resources and the energy of her people have more than compensated the caprice of events. France had, at the close of 1879, a navy of no fewer than 498 vessels, of 235,162 horse-power, the entire number carrying 2834 guns. This force is divided into 59 ironclads, 264 unarmored screw-steamers, 62 paddle-wheel steamers, and 113 sailing-vessels. The ships are distributed among five maritime divisions, viz., Cherbourg, Brest, L'Orient, Rochefort, and Toulon. But comparatively very few of the ships are equipped for service: they are laid up in ordinary, and can be promptly put into fighting trim, and in the meanwhile no fewer than 50 additional vessels are in course of construction. The navy is manned partly by conscription and partly by voluntary enlistment. None but men above 20 and under 40 years of age are admitted into the service. At the head of the administration of each maritime division there is a vice-admiral, called a *préfet maritime*. There are 19 other vice-admirals in active service, and 13 on a reserved list; 30 rear-admirals, and 21 reserved; 109 captains of first-class men-of-war, and 209 captains of frigates; 648 lieutenants, and 516 ensigns. The engineers are in proportion to the number of vessels actually placed on the service list.

Frank. The fish-eating heron.

Franklin, Sir John. An English navigator and Arctic explorer. Born in Spilsby, Lincolnshire, April, 1786; died June 11, 1847. Entering the navy about 1800, he served with distinction at Trafalgar, and was slightly wounded in the attack on New Orleans, January, 1815. As a lieutenant he commanded the "Trent" in the Arctic expedition of 1818, under Capt. Buchan. In 1819 he led an overland expedition to trace the coast-line of North America, an account of which he published on his return, and was made a captain. In 1825 he renewed this enterprise, tracing the coast from the mouth of the Coppermine River to the 150th meridian, for which service he was knighted. Governor of Van Diemen's Land in 1836–42. In May, 1845, he sailed with the "Erebus" and "Terror" to discover a northwest passage and never returned. Several expeditions were sent in search of him from England and America without success, but Dr. Rae found, in 1854, some relics of the party. In the summer of 1859 Capt. McClintock discovered on the shore of King William's Land a record deposited in a cairn by the survivors of Franklin's company, dated April 25, 1848, stating that Sir John died June 11, 1847; that the ships were abandoned April 22, 1848, when the survivors, 148 in number, started for the Great Fish River. Many relics were found of this party, who perished on their journey, probably soon after leaving their vessels.

Frap. To bind tightly with a rope or piece of small stuff. When a ship is very old and her timbers work, cables may be passed round, serving to hold her together. St. Paul's ship was *undergirded*.

Fredericton, a port of entry and city of New Brunswick, capital of the province of the county of York, is situated on the west side of the river St. John. Lat. 45° 55′ N.; lon. 66° 31′ 30″ W. The public buildings comprise the parliament buildings, the government house, city hall, and barracks. The river, which is here three-fourths of a mile wide, is, however, only navigable for sea-going vessels of 120 tons. Pop. 6150.

Free. To clear; to set at liberty; as, to *free* a boat of water, to *free* a prisoner. The wind is *free* when the ship is not obliged to brace her yards sharp up. *To run free*, to sail with the yards braced in and sheets eased off.

FREEBOOTER. A robber; one who scours the seas for purposes of pillage, a pirate.

FREE PORT. A port where goods may be landed free from custom-house restrictions. A port where goods of all kinds are received at equal rates.

FREE SHIP. A neutral vessel. The doctrine that "free ships make free goods," which means that an enemy's goods, other than such as are contraband of war, found on board a neutral vessel are free from confiscation, has been much discussed and alternately admitted and rejected by most maritime nations. Great Britain has, however, uniformly maintained the opposite doctrine, viz., that enemy's goods found on board a neutral ship may lawfully be seized as prize of war, and the latter proposition has been explicitly incorporated into the jurisprudence of the United States, and declared by the Supreme Court to be founded on the law of nations. This rule, known as the "belligerent rule," is, however, even by those nations which insist on its being the original doctrine of international law, often made to yield to the other and more liberal doctrine by conventions between themselves.

In the days when piracy was more common than it is now, piratical craft were often called *free ships*.

FREE TRADER (*Eng.*). A ship formerly trading to India independently of the East India Company. A prostitute.

French Fake. A fake or coil of rope where the turns dip one under the other, so as not to foul in running.

French Lake. The Mediterranean Sea.

French Leave. Absence without permission. *To take French leave*, or *to French*, is to leave without permission.

Frenchman, or Frenchy. A sailor's name for any foreigner, particularly of the Latin race.

French Sennit. Sennit in which an odd number of nettles are regularly and evenly woven one under and then over the others in succession. See SENNIT.

French Shroud-knot. A shroud-knot in which the three strands of one end are walled over those of the opposite end.

French the Ballast. To freshen the ballast.

Fresh. New; not impaired by use nor time. Slightly intoxicated. Impudent; cheeky. Not salty. Overflow of running water. The current of a river in the sea beyond its mouth. *Fresh breeze,* a breeze blowing from 13 to 15 miles per hour, in which royals may be carried; indicated by 5 in the Beaufort scale. *Fresh topgallant breeze,* a breeze blowing from 15 to 17 miles per hour, in which topgallant-sails may be carried; indicated by 6 in the Beaufort scale. *Fresh wind,* a wind blowing from 17 to 18 miles per hour, in which topgallant-sails are taken in and topsails reefed down; indicated by 7 in the Beaufort scale.

FRESHEN. To renew. *To freshen the hawse,* to veer out a little more cable to bring the chafe and strain on another part. *To freshen the ballast,* to shift or restow it. *To freshen the way,* to increase the speed of the ship. *To freshen the nip,* to veer on the cable or pull upon a backstay to shift the chafe from a particular spot; also, to take a drink, especially just after the sun dips; this was accompanied by the toast "downfall of the barbarous Moors."

FRESHES. Swollen ebb-tides due to heavy rains.

FRESHET. A current or stream swollen by heavy rains or melting snow.

FRESH GRUB. Provisions not salted.

FRESH HAND. A greenhorn; a new hand. When a gale increases the sailors say there is a *fresh hand at the bellows.*

FRESH WATER. Water fit to drink, in opposition to salt water. In early days ships were obliged to carry immense quantities of fresh water, but of late it has been obtained by distillation of salt water. See DISTILLER.

FRESH-WATER SAILOR. One who is not accustomed to the sea, his experience having been confined to lakes and rivers.

FRESH-WATER SEAS. The Great Lakes.

FRESH WAY. Increased speed. *To gather fresh way,* to recover speed after being stopped or checked.

Fret. A narrow strait of the sea—from *fretum.* To chafe. *A fret of wind,* a light flaw.

Friar-skate. The sharp-nosed ray (*Raia oxyrinchus*).

Friction. A force which acts between two bodies at their surface of contact, and in the direction of a tangent to that surface, so as to resist their sliding on each other, and which depends on the force with which the bodies are pressed together.

There is also a kind of resistance to the sliding of two bodies upon each other, which is independent of the force by which they are pressed together, and which is analogous to that kind of strength which resists the division of a solid body by *shearing,*—that is, by sliding one part over another. This kind of resistance is called *adhesion.*

Friction may act either as a means of giving stability to structures, as a means of transmitting motion in machines, or as a cause of loss of power in machines.

FRICTION-BAND, or STRAP. A flexible band used as a brake to resist the rotary motion of a wheel, shaft, or pulley. It is firmly secured to a rigid part of a machine or structure, and is made to clasp or release a revolving part at will by means of screws or levers. It is applied on steamships to check the revolving motion of the screw-propeller when the vessel is under sail headway, and it is desired to "couple" the engines with the screw for the purpose of using steam-power.

FRICTION-BAR. A bar on the slide of an iron gun-carriage that is made by friction to absorb the recoil.

FRICTION-PRIMER, or FRICTION-TUBE. A primer used to inflame the charge of a gun. It consists of a metal tube filled with fine-grained powder, having at its upper end a short tube at right angles, in which is a notched iron wire, imbedded in fulminating composition. A loop in this notched wire receives the laniard, and its friction ignites the fulminate.

FRICTION-RAIL. An iron rail on an iron gun-carriage, that by pressing against the friction-bar absorbs the recoil.

FRICTION-ROLLERS. Rollers of hard wood or metal placed in a metal bushing about the axis of a sheave or truck to aid in reducing the friction.

FRICTION-TRANSOM. The transom of a gun-slide to which the friction-bars are attached.

Friday. An unlucky day in the seaman's calendar. By old sailors it was, and is, considered imprudent to commence any undertaking on Friday.

The superstition extends to India, among the Brahmins. Friday's moon was an unlucky one in England.

Probably it owes much of its unlucky character in the sailor's mind to its being a *jour maigre,* a banian-day, or one on which no meat was allowed to the crew; hence, a black-letter day in the seaman's calendar. Fish brought in on Friday were likely to decay, as they would not be sold before the following week; hence the fisherman's superstition. Good-Friday is called in German *charfreitag,* mournful Friday, and here its unlucky character would seem to originate.

Friezing. The ornamental carving or painting above the drift-rails and around the bow and stern.

Frigate. A familiar name for the Portuguese man-of-war, *Physalis pelagica.*

Frigate. The name was anciently written in English *friggot* and *frigat,* meaning, according to Webster, an open ship or vessel; this authority also says it is probably derived from the Latin *fabricata,* something constructed or built.

In Portuguese it signifies a boat as well as a ship. The word as generally used at the present time signifies a ship of war with two decks for guns, and mounting from 20 to 60 guns. In 1799, "The British Naval Chronicle" says, "Frigates mount from 20 to 40 guns, and some taken from the French mount 46."

The author of the *Dictionnaire de la Marina,* published in Amsterdam in 1739, is the only writer that treats of the frigate. He says the word derives its origin from the Mediterranean, where it was used to designate long vessels that

used both sails and oars, and carried a deck of which the topside, being higher than that of galleys in general, had openings resembling port-holes for the passage of oars. What occasioned this name for swift sailing and pulling galleys is not known. The same name was applied by the French to a very swift-flying sea-gull. It is easy to conceive that France, bordering upon the Mediterranean, should, ere long, have launched similar vessels from her channel-washed shores, adapting them, by a bluffing body and larger size, to encounter the storms and swells of a northern sea.

Towards the middle of the 16th century English merchant ships were generally called "frigates," as are the Spanish merchant ships of the present time, "*da guerra*" being added to distinguish a ship or frigate of war. Towards the close of the 16th century some of these merchant-frigates were hired to serve in the navy. In 1588, we find among the ships serving with Sir Francis Drake the "Friggat Elizabeth Fonnes, of eighty tons and fifty men," about the size of a small fishing-schooner, and not so large by one hundred tons as modern yachts such as the "America" and "Henrietta." The "Elizabeth Fonnes" was one of the English ships fitted out to oppose the far-famed and self-styled "Invincible Armada."

Sir Robert Dudley, Duke of Northumberland, prepared drafts of seven distinct classes of ships of war, among which was one 160 feet in length, and having 24 feet beam, constructed to carry a tier of guns on a single whole deck, beside other guns on two short decks, resembling the quarter-deck and forecastle, or, rather, not being united by gangways, the poop and topgallant forecastles of modern ships. The disposition of the guns on board this vessel was precisely the same as in the modern single-banked frigate, and Sir Robert called his ship thus constructed and armed "frigata."

The first English navy list on which the name occurs was published in 1604, and contains only a "French Frigat." She is placed on that list the last but one, and could have been but little more than a boat, her burden being only 15 tons.

The next English navy list that bears the name is that of 1633, on which we find registered "Swann Frigat" and "Nicodemus Frigat," each of 60 tons, 10 men, and 3 guns. These were probably pleasure-yachts, built to attend Charles I. on his frequent visits of inspection to his different naval depots.

Fuller, writing about the year 1660, says: "We fetched the first model and pattern of our friggots from the Dunkirks, when in the days of the Duke of Buckingham, then admiral, we took some friggots from them, two of which still survive in His Majesty's navy by the names of the 'Providence' and 'Expedition.'" The duke, then Marquis of Buckingham, was the lord high admiral from 1619 to 1636, and the names of these two vessels occur in the lists of 1632 and of 1652. They seem to have been small ships, mounting from 20 to 30 guns, chiefly on a single deck.

Mr. Pepys, the historian, who, from his position in the Admiralty, may be considered good authority, says that the first frigate built in England was the "Constant Warwick," built by Mr. Peter Pett, the elder, at Ratcliffe in 1646 as a privateer for the Earl of Warwick, and afterwards sold by him to the Commonwealth. This Peter Pett was also the constructor of the first English three-decker, "The Sovereign of the Seas," but he had it recorded on his tombstone, evidently esteeming it the greatest honor, that he was the "*inventor* of the first frigate."

His son confessed to Pepys that his father took his model of a frigate from a French frigate which he had seen in the Thames. Probably the Frenchman was a privateer, and quite likely one of the many which the enterprising Dunkirkers had equipped.

Fuller and Pepys both refer to a model or pattern showing some distinguishing peculiarity between a frigate and the ordinary ships of war, yet neither give the faintest description of what the peculiarity was, whether in form, armament, rig, or all three united.

The dates of the transfer of this "frigate" to the navy by the Earl of Warwick is unknown; but her first appearance on any list as a national vessel was in 1652, when she is classed as a *fifth-rate* of 28 guns; in another list of the same year her guns are stated at 32. When a privateer she mounted but 26. In 1677 she appears on the list as a *fourth-rate*, mounting 42 guns. The "Constant Warwick's" length of keel was 90 feet, her breadth of beam 28 feet 2 inches, depth of hold 12 feet, draft of water 12 feet 8 inches, and her tonnage, modern measurement, 380 to 400 tons.

Her armament consisted at first of 18 light demi-culverins, or short 9-pounders, on the main deck; two minions, or 4-pounders, on the roof of the officers' cabin, or poop, and six light sackers, or short 6-pounders, on what may be called the quarter-deck. The main, or gun-deck of this frigate, as in modern vessels of this class, had originally a continuous tier of guns, nine of a side, to which subsequently one was added for each bow port, before unprovided, making 20 in all; on her second, or spar-deck, the bulwarks, or barricades, only extended, in the first instance, to the gangway or mainmast; behind them were mounted the six sackers, or 6-pounders. These bulwarks were afterwards extended forward, and thus gave room for a second whole tier of guns, which, with the minions on the poop, extended forward to the side of the quarter-deck, and mounting six 4-pounders instead of two, as formerly, converted her into the 46-gun ship she was represented.

She was disposed of by the earl, after having shown decided proofs of superior sailing over all other classes of vessels; nevertheless, we may credit a writer who, in 1665, complains of the ships of the British navy being "*over-gunned*," and instances "The Constant Warwick from twenty-six gunns and an incomparable sayler to forty-six gunns and a slugg." Retaining her original appellation, we see that from a properly armed, snug one-decked vessel, the "Constant Warwick" was converted into an over-gunned, top-heavy, two-decked ship, the only good quality remaining to her being the original sharpness of her lower body, or what a modern naval architect would call the fineness of her lines. This sharpness of form appears to be the only characteristic of the frigate which English builders thought worthy of being retained, and seemed to them a property suited to all sizes and classes of ships. Accordingly, we find, between the

years 1646 and 1653, upwards of 60 "frigates" were built or building, and one of the latter designed to mount from 50 to 80 guns, while the others are variously classed from 56 down to 12 guns. The name at that time seems to have been general to all but ships of the first class. The natural effect of this sharpness applied to an overloaded ship of 60 or 70 guns was to immerse her so deep in the water that her lower battery was sunk too low and too near the water-line to be useful.

According to Mr. Pepys, "In 1663 and 1664, the Dutch and French built ships of two decks, which carried from 60 to 70 guns, and were so contrived that they carried their lower deck guns four feet from the water, and to stow four months' provision; whereas our frigates from the Dunkirk build, which were narrower and sharper, carried their guns but little more than three feet from the water, and but ten weeks' provision." Mr. Pepys then states that five frigates, viz., three of 70, one of 66, and one of 64 guns, were ordered to be built of such dimensions as to obviate those defects. Eight or ten years later Mr. Pepys, still complaining of the want of buoyancy of the British frigate, says: "In 1672 and 1673 the French brought a squadron of 35 ships to join our fleet at Spithead. There were several excellent ships with two decks and a half that carried from 60 to 70 guns, more especially one called the 'Superbe,' which his Majesty and Royal Highness went on board of. She was 40 feet broad, carried 74 guns, and six months' provisions. Our frigates being narrow could not stow as much provision, nor carry their guns so far from the water, which, Sir Anthony Deane observing, measured the ship, and gave his Majesty an account thereof, who was pleased to command Sir Anthony to build the 'Harwich' as near as could be of the 'Superbe's' model and dimensions, which was done accordingly with such general satisfaction as to be the pattern of the second- and third-rates built by the late act of Parliament."

Thus in less than twenty years the first frigate spread her name, if not her qualifications, over nearly the whole of the British navy.

From 1677, the date when first- and second-rates excluded two-decked ships, the name "frigate" was confined to the third and three inferior rates. Towards the close of the 17th century the first *four* rates of the British navy assumed the name of *line-of-battle ships*, or *ships of the line*, and the frigate was restricted to the fifth- and sixth-rates.

When first arranged the ships of the line comprised all vessels of over 50 guns, and frigates those from under 50 to 20 guns. In 1727 frigates were of three classes, viz., 40, 30, and 20 guns, measuring 600, 420, and 374 tons respectively, and mounting 12-, 9-, and 6-pounders. Two new classes were added in 1740. The one a 44-gun ship, of about 710 tons, with 40 guns upon two decks, with batteries of 18- and 9-pounders instead of 12's and 6's, also with four 6-pounders additional on the quarter-deck. The other was a 24-gun ship, of 440 tons, with twenty 9-pounders on the main, or gun-deck, two 9-pounders on the spar-deck, and two 3-pounders on the quarter-deck. Within the nine years next succeeding thirty-eight of the 44's were built, and several of the old 40's made to carry four 6-pounders on the quarter-deck, and thus, in 1755, the old class of 40's became extinct. In 1748 a 28-gun ship, of 585 tons, and carrying twenty-four 9-pounders on her main and four 3-pounders on her quarter-deck, was constructed, and proved a decided improvement on the old 24, as well as the 30-gun class. This 28 is the first ship which in the arrangement of her guns conveys any idea of a modern frigate.

In 1757 two new classes—a 32 and the other a 36—were added. On the 29th of March, 1756, the navy board agreed with Robert Inwood to build a fifth-rate ship, on a plan proposed by Sir Thomas Slade, a surveyor of the navy. This ship was to measure 671 tons, and to mount twenty-six 12-pounders on the main, four 6-pounders on the quarter-deck, and two 6-pounders on the forecastle. She was launched May 5, 1757, and was called the "Southampton,"—a name still retained in the English navy. Another like her, and named "Diana," was launched in August, and others followed. The "Alarm," on which copper sheathing was first tried, in 1761, was of this class. Much smaller ships, however, continued to retain the designation of frigates, for between 1757 and 1760 four ships were built for the English navy and four captured by it, which averaged only 312 tons, and mounted from 14 to 18 guns, and these, in the record of 1760 and of 1762, are styled frigates. They were soon after stripped of that name, and called "sloops," or "sloops-of-war."

The "Southampton" must be considered as the first genuine frigate of English build,—that is, she was the first English ship constructed to carry her guns on a single whole deck, a quarter-deck, and a forecastle, the unvarying characteristic of the sailing-frigate of our later times. The "Southampton" bore the character of a good sea-boat and prime sailer, and after a successful career of fifty-six years was wrecked on a reef in the Crooked Island Passage.

The 36-gun frigate of this date averaged 720 tons, and was armed with four additional 6-pounders on the quarter-deck. Three of this class and rate only were built, viz., the "Pallas," launched in 1757, and the "Brilliant" and "Venus." In 1774 some newly-discovered virtues in the old 44-gun ship caused twenty-nine of them to be built. Like their predecessors, they proved crank, and carried their guns too low, and, after several endeavors to improve them, they were deprived of their guns on the lower deck and, being fitted with poops, converted into store-ships.

The first Admiralty order establishing the 38-gun frigate is dated September 30, 1779, and marks their first appearance as a British class. Previous to 1782 five had been launched, averaging 946 tons. These ships were named "Arethusa," "Latona," "Minerva," "Phaeton," and "Thetis." The "Minerva," the first afloat, was launched at Woolwich, June 8, 1780. These ships mounted twenty-eight 18-pounders on the main deck and eight 9-pounders on the quarter-deck and forecastle, throwing 300 pounds of metal at a broadside.

Carronades were invented the year these vessels were ordered by the Admiralty, and eight 18-pound carronades and fourteen swivels, in addition to their original armament, were placed on board them, converting them in reality into 46-

gun ships. The swivels were disposed of when the two forecastle guns were reduced from 12- to 9-pounders. In 1781 there were 604 carronades in the royal navy, of sizes from 32-pounders to 12-pounders. With the advance in ordnance and marine architecture the frigates of the Old World increased in size and military value; but they continued to be used, as originally intended, as the "scouts," so to speak, of the main body of a sea army. Nelson called them the "eyes of the fleet."

On July 10, 1797, was launched at Philadelphia the "United States," frigate, the first of those American "forty-fours" which were destined to become so celebrated in the annals of naval warfare. They were longer proportionally, had heavier scantling, and carried heavier batteries than any ships of equal rating in the world. They were spoken of in England as "74's in disguise." Their appearance on the ocean effected a marked change in the designing and arming of ships of war of foreign navies. "It is but justice in regard to America," writes an eminent English authority, "to mention that England has benefited by her example, and that the large class of frigates now (1840) employed in the British service are modeled after those of the United States."

Passing over the periods marked by the appearance of the "Fulton," "Missouri," and "Princeton," we may come at once to the "Minnesota" class of steam-frigates, launched in 1855. These magnificent specimens of naval architecture, with their enormous batteries, were in their day the wonder and admiration of the entire maritime world.

A clever writer on English naval affairs says, "It was not until comparatively recent times that the navies of different powers began seriously to vie with each other in the introduction of the very destructive ordnance now in use, the largest known specimens of which are to be seen on board the new American frigates" (the "Minnesota" class).

The "forty-four" of 1812 carried a battery of thirty 24-pounders on the gun-deck, fourteen 32-pounder carronades on the quarter-deck, and six 32-pounder carronades on the forecastle; making a total of fifty guns, throwing 1360 pounds of solid shot, or 680 pounds at a broadside. She had a complement of 430 men, and cost, to build, $220,910. The "Minnesota's" battery in time of war consisted of twenty-eight 9-inch shell guns on her gun-deck, twenty 9-inch guns on the spar-deck, and two 11-inch pivot-guns mounted on the forecastle and quarter-deck, respectively. This gave a total of fifty guns, throwing 3799 pounds of loaded shell, or 4320 pounds of solid shot; or a broadside of 2035 pounds of shell, or 2492 pounds of solid shot. Her displacement is 4700 tons. The "Ohio," a fair representative of the line-of-battle ships, has a displacement of 4250 tons, and threw at a broadside 1612 pounds of solid shot. By comparing these figures and considering the increased mobility due to steam-power, an idea may be formed of the relative military value of the frigate of the steam period and the line-of-battle ship of the last of the sail period.

The estimated cost of a line-of-battle ship in 1812 was $333,000. The cost of a modern frigate may be seen from the following table:

	Cost of Hull.	Machinery.	Total.
Colorado	$828,143	$170,000	$998,143
Merrimac	707,062	172,064	879,126
Minnesota	694,711	154,982	849,693
Niagara	858,904	234,361	1,093,265
Roanoke	644,215	170,000	894,215
Wabash	813,644	165,924	979,568

From this comparison it will be seen how completely the term frigate has ceased to convey any idea of the military value of a vessel of war.

A *frigate-built* ship is one having the decks arranged like those of the earlier frigates, *i.e.*,—with a raised quarter-deck and forecastle. From these there was a descent of a few steps to the *waist*. Her forecastle extended from the stem to the *belfry;* the quarter-deck from the stern to the gangway. The open space between was the *waist;* hence the term a "deep-waisted ship."

FRIGATE-BIRD. A large and rapacious tropical fowl of the genus *Tachypetes* (*T. aquila*), with very long wings; allied to the pelican.

FRIGATOON. A Venetian vessel built with a square stern, with a mainmast, jigger-mast, and bowsprit. The name is also applied to a ship-rigged sloop-of-war.

Frigid Zone. See ZONES.

Fringing-reefs. Narrow reefs of coral formation at short distances from the shore.

Frisk. To freshen, as the wind.

Frith. Derived from *fretum maris*, a narrow strait: an arm of the sea into which a river flows. Synonymous with *firth* (which see).

Fritters. Tendinous fibres of the whale's blubber, running in various directions, and connecting the cellular substance which contains the oil. They are what remains after the oil has been *tried* out, and are used as fuel to *try* out the next whale.

Frobisher, Sir Martin. This distinguished naval adventurer of the Elizabethan period, the first Englishman who sought to discover a northwest passage to China, was a native of Doncaster, but the year of his birth is unknown. After endeavoring in vain for many years to secure money and vessels to search for the northwest passage, he was patronized by several persons of rank and fortune, and succeeded in securing money enough to fit out two small vessels of 25 tons each, and a pinnace of 10 tons. With these he sailed from Deptford, June 8, 1576. On the 11th of August he entered the strait which bears his name. The second expedition under his command sailed in May, 1577, and the third in the following year. He afterwards served under Drake in the West Indies, and was knighted for distinguished bravery in the fight with the Spanish Armada, July 26, 1588. He died November 7, 1594, the result of a wound received while leading an attack by sea against Brest.

Frog. An old term for a seaman's coat or frock. A leather pocket or case for a pistol, bayonet, or cutlass. An amphibious animal of the genus *Rana*.

FROG-EATERS. Frenchmen.

FROG-FISH. See FISHING-FROG.

FROG-LANDERS. Hollanders.

FROG-PIKE. The female pike, spawning at the same time as frogs.

Frontage. The length or face of a wharf.

Frost. The congelation of the vapor of the atmosphere. The *hoar* frost, or *white* frost, which is seen in the mornings during spring and autumn, is merely frozen dew. See DEW.

FROSTED. Having a lustreless appearance, as metals, glass, etc., when not polished; this appearance somewhat resembles hoar-frost; hence the name. *Frosted* work is introduced as a foil or contrast to *burnished* work, in which the metal is highly polished.

FROST-FISH. A small fish, called also *tom-cod;* they are taken in large quantities in the depth of winter by fishing through holes cut in the ice.

FROST-RIME. See FROST-SMOKE.

FROST-SMOKE. A thick mist in high latitudes, arising from the surface of the sea when exposed to a temperature much below freezing; the vapors as they rise are condensed either into a thick fog, or, with the thermometer about zero, hug the water in eddying white wreaths. The latter beautiful form is called a *barber*, probably from its resemblance to soap-suds.

Froth. See FOAM.

Frumentariæ. The ancient vessels which supplied the Roman markets with corn.

Frush. A term for wood that is apt to splinter and break.

Fry. Young fishes.

Fucus Maximus. An enormous sea-weed, growing abundantly round the coasts of Tristan d'Acunha, and perhaps the most exuberant of the vegetable tribe. Said to rise from a depth of many fathoms, and to spread over a surface of several hundred feet.

Fuddled. Not quite drunk, but unfit for duty. Confused.

Fuel. Any substance used to produce heat by combustion, as coal, wood, peat, oil, etc. Carbon and hydrogen are the elements of heat in fuel.

Fuell. An old nautical word signifying an opening between two headlands.

Fu-fu. A sea-dish of barley and molasses.

Full. Complete; plump; filled out. Sails are *full* when the wind inflates them, so as to give the ship headway. The yards are said to be braced *full* when the sails are filled. *Keep her full!* an order to the helmsman to keep the sails full, and not allow them to shake.

FULL AND BY. Sailing close to the wind with yards sharp up and sails full.

FULL-BOTTOMED. Of great capacity below the water-line.

FULL DRIVE. Forcibly; with great vigor.

FULL DUE. For good; final.

FULL FEATHER. In full dress; attired in best clothes.

FULL FIG. See FULL FEATHER.

FULL MAN (*Eng.*). A rating in coasters for one receiving whole pay as being competent to perform all his duties; able seaman.

FULL MOON. When the moon is in opposition the whole illuminated disk is turned toward the earth; the moon is then said to be *full.*

FULL PAY. The pay allowed when on actual service.

FULL SEA. High water.

FULL SPEED. Highest speed.

FULL SPREAD. All sail set.

FULL SWING. Complete control.

Fulmar. A web-footed sea-bird, *Procellaria glacialis*, of the petrel kind, larger than the common gull; its eggs are taken in great quantity at St. Kilda and in the Shetlands.

Fulminates. The salts of fulminic acid. See EXPLOSIVES.

Fumado. A commercial name of the pilchard, when garbaged, salted, smoked, pressed, and packed.

Fumble-fisted. Awkward in catching a turn, or otherwise handling a rope.

Fumigate. To purify confined or infectious air by means of smoke, sulphuric acid, vinegar, and other correctives. See DISINFECTANTS.

Funeral Honors. On the receipt of official intelligence of the death of the President of the United States, the senior officer present, on the following day, causes the ensign of each vessel under his authority to be hoisted at half-mast from sunrise to sunset, and a gun to be fired by his vessel every half-hour, beginning at sunrise and ending at sunset. At naval stations the same ceremonies are observed.

On the death of a commander of a fleet, squadron, or division, at sea, the ensigns of all the vessels present, and the distinguishing flag of command which he wore, are hoisted at half-mast during the performance of the funeral ceremony; and on committing the body to the deep, the flag-ship fires as many minute-guns as he was entitled to receive for a salute when alive, and his flag is hauled down on firing the last gun. If occurring in port, the ensigns and distinguishing flag mentioned are hoisted at half-mast during each day from that of his decease until sunset of the one on which the funeral service is performed, and, on sending the body to the shore, the prescribed number of minute-guns is fired. The escort fires three volleys of musketry over the grave.

On the death of an officer commanding a vessel, at sea, the ensigns of all the vessels present, and the pennant of the vessel he commanded, are hoisted at half-mast during the performance of the funeral ceremony; and, on committing the body to the deep, the vessel he commanded fires as many minute-guns as he was entitled to receive as a return salute when alive. If in port, the pennant of the vessel he commanded is hoisted at half-mast during each day from that of his decease until sunset of the one on which the funeral service is performed; and, on sending the body to the shore, all the vessels present half-mast their ensigns until sunset, and the number of minute-guns indicated is fired. The escort fires three volleys of musketry over the grave.

On the death of a commissioned officer, other than those already mentioned, at sea, the ensigns of all the vessels present are hoisted at half-mast during the performance of the funeral service; and if in port, the ensigns are so hoisted during the time that the body is being conveyed to the shore, and until the return of the funeral escort to the ship. In either case, after the funeral services, three volleys of musketry are fired by the full marine guard.

On the death of an officer of the staff corps, the same funeral honors are observed as those prescribed for a line-officer of the same relative rank, except that the distinctive flag or pennant of the vessel is not hoisted at half-mast, and that no minute-guns are fired.

On the death of a warrant-officer, the ensigns of all the vessels present are hoisted at half-mast during the performance of the funeral service when at sea; and when in port, during the time that the body is being conveyed to the shore, and for one hour afterward. In either case, three volleys of musketry are fired by a sergeant's guard of fourteen men.

On the death of a petty officer, or other person of inferior rating, the ensigns of all vessels present are hoisted at half-mast during the performance of the funeral service when at sea; and when in port, during the time that the body is being conveyed to the shore.

On the death of an officer, non-commissioned officer, or private of the marine corps, the funeral honors are to be regulated by his relative rank.

If it should not be practicable to fire with musketry at the grave of any officer in a foreign country, the volleys are fired over the body after it is lowered into the boat alongside the ship.

Funeral honors are not to be paid before the rising nor after the setting of the sun.

Fungus. See Dry Rot.

Funk. To become frightened; to show the white feather. To blow tobacco smoke in a person's face.

Funnel. A metal tube for carrying off smoke from a furnace. The galley-funnel is familiarly known as Charley Noble.

Funny. A light clinker-built pleasure-boat, rowing a pair of sculls. It is long and narrow, and used for racing.

Fur. Scale formed in a boiler. To clean off the scale from the interior of a boiler.

Furl. To roll up and bind a sail to its yard or boom.

Furling-line. A small line for binding a sail to its gaff or boom when furled. A sea-gasket.

Furlough. The correct definition of the word *furlough* as used by the Navy Department is leave or license given by the Secretary of the Navy to an officer to be unemployed for a specified time. This is done upon request of the officer, and sometimes by decision of the Department, as in cases of officers who get duty on board vessels carrying U. S. mail. Furlough under such circumstances is not a punishment. Where an officer is put on furlough by the Secretary of the Navy as a penalty, or in the sense of implying censure, the word is used in the past tense, viz., *furloughed*. It so appears at least in the Navy Register.

Officers on *furlough* and officers *furloughed* receive one-half of the pay to which they would have been entitled if on leave of absence on the active list. (Rev. Stat., Sec. 1557.)

The Secretary of the Navy has a legal right to furlough any officer on the active list. (Rev. Stat., Sec. 1442.)

Furnace. A structure in which intense heat is produced by combustion and applied to such purposes as the manufacture and working of metals, generation of steam, etc. The general peculiarities of furnaces are designated by specific names, such as blast-furnace, reverberatory-furnace, steam-boiler furnace, etc.

Furnace-bridge. See Fire-bridge.

Furnace-door. A door for closing the mouth of a furnace.

Furniture. The rigging, sails, spars, anchors, cables, boats, provisions, etc., which make up a vessel's equipment.

Furole. The luminous appearance known as the *corpo santo*. See St. Elmo's Fire.

Furube. A fish taken on the coast of Japan, and considered to be poisonous.

Furze. Brushwood prepared for breaming.

Fuse. See Fuze.

Fusible Alloy. An alloy composed principally of tin, lead, and bismuth, which will melt near or below the temperature of boiling water. When the component parts are tin 19, lead 31, and bismuth 50, the alloy will melt at a little less than 212° F.

Fusible Plug. A plug of easily fusible metal or alloy screwed into a crown-sheet or other suitable part of a boiler-furnace, which, by melting when not covered by water, gives warning of low water and partially releases the pressure from the boiler. The device has never proved successful, and is not now in use.

Fust. A low but capacious armed vessel, propelled with sails and oars, which formerly attended upon galleys; a *scampavia*, barge, or pinnace.

Fustick. In commerce, a dye-wood brought principally from the West Indies and Spanish Main.

Futtocks. The crooked timbers placed in the lower parts of the frames of a wooden ship, commencing with the heads of the floor timbers, and as they go upwards are called first, second, third, and fourth futtocks until the top timbers are reached. The term *hook* is frequently applied to anything bent or curved, as boat-hooks, fore-hooks, after-hooks, etc. *Futtock* is a corruption of *foot-hook*, and is so named from its being placed at the foot of a timber.

Futtock-band. An iron band around the lower mast, to which the futtock-shrouds are secured.

Futtock-holes. Holes in the top-rim for the futtock-plates.

Futtock-plates. Certain iron plates having their upper parts open like a ring, to fix the dead-eyes in; and round holes are punched at the lower end of these plates for the futtock-shrouds to hook into.

Futtock-riders. These are used in merchant ships built of wood. They are placed on an angle of 40°, more or less, with the stem and stern-post, and are secured at the lower end to a hook which crosses the stem and at the upper end to the diagonal knee, towards which the rider is pointed; they are generally placed inside of the ceiling.

Futtock-shrouds. Lengths of iron chain connected with the futtock-band and the futtock-plates, and serving to take the strain of the topmast rigging. In large ships they are sometimes rattled down for convenience in getting into the tops.

Futtock-staff. A leather-covered iron rod inside the topmast rigging for the topgallant shrouds to lead over.

Fuze. The local apparatus for inflaming the charge of a shell or torpedo.

The fuzes for shells are classified as time-, percussion-, and concussion-fuzes, according to their mode of operation.

The time-fuzes used in the navy are:

1. Navy metal stock time-fuze, for S. B. spherical and for M. L. R. shell.
2 Bormann fuze.
3. Time-fuze, wooden stock, for B. L. howitzers.
4. The bomb or mortar fuze.
5. Rear fuzes, in base of rifle-shell.

The navy time-fuze is fitted to all spherical shell (except the 24-pounder and 12-pounder boat-howitzer ammunition) and to a part of the expanding shell for rifle guns. This fuze consists of a column of inflammable composition driven in a paper case, intended to burn a certain number of seconds, having a safety-plug attached to its lower orifice in such a way as to prevent the issue of flame so long as it remains fixed, and also to guard the composition against the effects of moisture.

In practice, this plug, which consists of a short solid cylinder of lead, is detached from its position upon the firing of the gun, the jar caused by the explosion being sufficient, thus leaving the fuze-composition in contact with the shell charge. The safety-plug is omitted in time-fuzes intended for use in rifle-shell.

The paper case in which the composition is driven is made slightly tapering to fit into the metal stock, the safety-plug attached to the lower end projecting through the stock about half an inch.

The composition is covered on top by a water-cap, of peculiar construction, being primed on its outer surface with a strand of quick-match and powder; its object is to protect the flame from being extinguished on ricochet; this is next covered by a thin piece of parchment, and over all by a leaden patch, which is firmly fixed by being expanded to fill the recess in the metal stock; it is provided with a lug, that it may be stripped off to expose the priming, otherwise the fuze will not ignite, and consequently the shell will not explode. The length of fuze, in seconds, is stamped upon the leaden patch, and outside of all, printed upon paper, is pasted the date of manufacture, length of fuze, with initials of inspecting officer.

These fuzes are of 3½, 5, 7, 10, 15, and 20 seconds time of burning, a certain proportion of each being supplied to each ship, although all shell, unless otherwise ordered, are fitted and issued from the shell-houses with the 5-second fuze, which is regarded as the general working fuze. For greater or less distances this fuze may be drawn, and any of the others substituted. The navy time-fuze is rarely extinguished by several ricochets on water; and near the end of its flight, when fired direct, frequently acts by concussion. The fuze used should not be of longer time of burning than requisite to reach the object; the shorter times are of quicker composition, therefore more certain; also on firing on ricochet the shell may sink short of the distance necessary for its explosion, and consequently be supposed to fail.

For special firing, as, for example, at shore batteries or masses of uncovered troops, any of these fuzes may be shortened. To do this, unscrew the water-cap and back the paper case out from the lower end with a drift and mallet; cut off from the lower end with a fine saw, or sharp knife struck with a mallet, the proportional part required, and insert the upper part in the stock, forcing it down with a few gentle blows with the drift; screw on the water-cap. But this operation should only be performed by an expert, and in cases of necessity: as when done by inexperienced persons, premature explosions have been caused, seriously damaging the guns. It is preferable, therefore, when circumstances will admit, to take up such distance as will correspond with the time of flight of one of the regulation lengths. When firing against ships or earth-works, the fuze should be a little longer than necessary, in order to reach the object before bursting; but a little shorter when firing against boats or masses of troops, in order to insure its bursting in front of them.

Time-fuzes are generally very unreliable in rifle guns, as expanding or forced projectiles cut off the flame from the fuze; but with the Parrot shell, the navy time-fuze is comparatively certain of ignition and regular in its time of burning. The safety-plug must be removed when the navy time-fuze is used in rifled cannon, as recent experiments show that it is a probable cause of premature explosion of shells. In testing the navy time-fuze by the watch or michrometer, the safety-plug must be removed; otherwise the fuze will burn longer than the time for which it is marked, as all navy time-fuzes, being intended for use under a water-cap, burn a longer time in the open air.

The Bormann fuze is fitted to all S. B. shrapnel and the 24-pounder and 12-pounder boat-howitzer ammunition, and has been fitted to certain shell for special firing; the length of the fuze being the limit of distance within which this fire is effective. It consists of a short cylindrical case of soft metal (composition of lead and tin), containing an annular space charged with fuze-composition of a uniform density and thickness throughout. The annular space or indentation for the composition is made on the lower side, in the shape of a horseshoe, one end of which connects with a small magazine in the centre of the fuze. This indentation extends nearly through the cylinder, that portion of the metal left on top being quite thin. The fuze is charged from the under side, a strand of quick-match being first placed in the bottom of the channel; the fuze-composition is then laid in a smooth layer throughout, and a ring of the same metal as the case is pressed upon it by machinery, sealing it hermetically. The cylindrical opening or magazine in the centre is filled with fine powder and covered with a cap of sheet-lead; with those supplied at present this cap is made quite thin, obviating the perforation heretofore necessary.

The metal on the upper surface of the fuze over the composition is graduated in equal parts and marked in seconds and quarter seconds, and being quite thin is easily cut with a gouge, thus exposing the fuze-composition to the flames. Care should be taken in making the cut not to pierce the priming-chamber or magazine, which would necessarily cause an explosion at the muzzle of the gun.

On the side of the fuze the thread of a screw is cut, by which means it is fitted to the projectile; and to prevent its being driven into the shell by the explosive force of the charge, the fuze being made of soft metal, it is supported by a composition plate, which is first screwed into the fuze-hole, having a perforation in its centre

for the flame to pass through. No oil is to be used on the threads of this fuze, and on screwing it in it must be started fair, so as to be evenly supported on the plate.

The date of manufacture and initials of inspecting officer are stamped on the upper surface of the fuze, and on the bottom is pasted a piece of paper on which is noted the date when inserted in projectile.

This fuze is opened at the required number of seconds by cutting close to the right of the mark on the index plate. The cut should be made down to the plane of the table, in order to expose the composition; and is best made by two or three efforts, instead of trying to effect the cut at once. This fuze should be carefully explained to the men, as shells have been taken from guns with the cut actually made into the priming-magazine.

The time-fuze for B. L. howitzer, which is virtually a modification of the English Boxer fuze, consists of a beech-wood stock, conical in form, fitted to receive the paper-case fuze, which is somewhat less in diameter than the regulation navy time-fuze already described. Just above the upper face of the fuze-composition is an unoccupied space from which four gas-vent channels lead to the outside of the stock above the point of the shell. Immediately above this gas-vent chamber the bore of the stock is considerably enlarged to receive the igniter. This consists of a small bronze hollow cylinder, closed at the lower end, where it is furnished on the inside with a pierced nipple for a percussion-cap. The upper edge of the hollow cylinder is flanged in such a manner as to rest on top of the stock; thereby preventing the igniter from being driven bodily into the fuze on discharge of the gun. Inside of this hollow cylinder the plunger is hung on a brittle wire (half copper and half lead). When this arrangement is in place the head of the fuze is covered with a piece of paper or linen, luted down and coated with shellac. Thus far the fuze only burns for the full time for which it was pressed. In order to provide for intermediate times, two side channels are bored from the lower end of the fuze upward. Holes bored at equal intervals from the outside of the stock connect the exterior of the fuze with the side channels; the lowest communicating hole in each channel being bored entirely through to the fuze-composition. The channels are filled with mealed powder and paper pasted over the exterior of the time-holes. Upper and lower ends of the stock are served with brass wire.

To use the fuze, with a suitable tool pierce through the communicating hole, which corresponds to the number of seconds desired, into the column of fuze-composition, then push the fuze by hand, giving it a slight twist, into the nose of the projectile, and load the gun. On explosion of the charge the igniter acts as usual, and the fuze-composition burns down to the point at which it was pierced; then the flame flashes into the side channels, down the latter to the lower communicating hole, and thence to the bursting charge.

The bomb- or mortar-fuze consists of a conical wooden plug turned off the proper size of the fuze-hole, and about seven and a half inches in length; the axis of the plug is bored out cylindrically from the large to within a short distance of the small end, the latter being left solid. The plug is graduated and marked on the exterior in inches, the fuze-composition with which it is filled being driven hard and as evenly as possible, so as to burn at the rate of seven seconds to an inch, making the extreme length of the fuze forty-nine seconds. At the large end a cup is hollowed out and filled with mealed powder moistened with alcohol. The rate of burning is ascertained by experiment, and marked on a water-proof covering, which is tied over the cap. A fuze-saw is supplied, and must be at hand during practice, to cut the fuze at the required length.

Fuzes for sea-coast mortars are also driven in conical paper cases marked with the number of seconds they burn per inch. These cases are inserted in a metal or wooden plug previously driven in the fuze-hole, and accurately reamed out.

Base-fuze. With forced and expanding projectiles the flame of the discharge frequently fails to ignite the fuze placed in the forward end of the projectile; there are also objections to the use of the fulminates and chemicals of percussion- and concussion-fuzes. These reasons have led to the invention of time-fuzes placed in the base of projectiles, several kinds of which are now on trial.

Percussion-fuzes are those which are prepared for action by the shock of the discharge, and put in action on striking the object. The only fuze of this kind used in the navy is the *Schenkle-fuze*, which consists of a hollow metallic stock, cylinder, and cap. The stock is made of composition, and in appearance is similar to that of the navy time-fuze. The cylinder is of steel, about an inch and a quarter in length, filled with quick-burning composition, and has fixed at its forward end, in a cylindrical recess, a nipple, projecting slightly, on which an ordinary percussion-cap is placed. The cylinder fits loosely in the fuze-stock, and is suspended by means of a small brass screw, which passes through a hole in the side of the stock and into the cylinder. This screw is not to be removed, or premature explosion in the gun is likely to occur.

A brass cap, plain on one side and countersunk on the other, screws into the head of the stock over the cylinder; the object of its being made with one side countersunk, is to guard against the danger of accidental explosion should the cylinder or plunger become loose, as the cavity is of sufficient depth to prevent contact with the percussion-cap, it being particularly ordered that it shall be screwed in with the cavity next the plunger; *to be reversed only when the shell is entered in the gun, at which time it is absolutely necessary.* In firing, the jar caused by the explosion of the charge in the gun breaks the screw, the cylinder is released and recedes to the bottom of the fuze-case, and upon striking an object of sufficient resistance the cylinder moves forward with violence, the percussion-cap coming in contact with the *plain* side of the brass cap explodes, thereby igniting the fuze-composition, which communicates flame to the bursting charge in the shell. These fuzes are all made of one size.

The best effect of a percussion-fuze is obtained by firing into a mass of timber. They frequently fail if fired into a bank of soft earth, sand, or

other material which does not offer a sufficiently sudden resistance; also, if fired at high angles of elevation, owing to the fact that the rifle-shells do not generally strike point foremost.

Concussion-fuzes are put in action by the shock of discharge, but the action is restrained until the projectile strikes the object. These fuzes, as well as the percussion-fuzes, are wholly independent of the time of flight, and are dangerous to handle on account of the fulminates and chemicals which they contain.

Combination time-fuze. The composition is ignited by a percussion contrivance put in action by the shock of discharge, after which it burns as an ordinary time-fuze.

Fuzes used in torpedoes may be classified as percussion-, friction-, chemical, and electric fuzes.

A *percussion-fuze* is one in which the heat is produced by a blow on some fulminating compound. The blow may be produced by releasing a compressed spring which acts on a hammer, by the dropping of a weight, or by the impact of a moving body.

A *friction-fuze* is one in which the heat is evolved by the friction of a metallic surface on the composition, or by the friction of the particles of the composition on each other.

A *chemical fuze* is one in which substances separated until required for action are then brought into contact, and, uniting chemically, produce heat.

An *electric fuze* is one in which the heat is caused by electricity. The heat may be caused by the shock or blow of disruptive discharge acting on a sensitive composition, or by the heat generated by the passage of an electric current over a conductor of high specific resistance.

Fuzzy. Not firm or sound in substance.

Fyke. A bow-net for taking shad. The *Medusa cruciata*, or Medusa's head.

G.

G. Of the letters used in the log-book to indicate the state of the weather, *g* denotes *gloomy weather*.

Gab. An old but vulgar term for the mouth. *Gift of the gab*, facility of expression. See ECCENTRIC-HOOK.

Gabarre (*Fr.*). A river-lighter. A storeship.

Gabart, or **Gabbert.** A flat vessel with a long hatchway; used in canals and rivers.

Gabbok. A voracious dog-fish in St. George's Channel.

Gaberdine. An old name for a loose felt cloak or mantle.

Gabert. See GABART.

Gable, or **Gabulle.** An old form of *cable*.

Gaby. A conceited simpleton.

Gachupin. A South American name for a Spaniard.

Gadoid. One of a family of soft-finned fishes having the ventral fins below or in advance of the pectoral, of which family the cod is the type.

Gaff. A small spar projecting abaft a mast, which extends the head of a fore-and-aft sail not set on a stay. The inner end is called the *jaws*, and the outer, the *peak*. It has cheek-blocks for the brails, and iron bands with eyes for the vangs, throat- and peak-halliards. It is sometimes stationary, being secured to the mast by eye-bolts on gaff and mast; when fitted to hoist and lower, it slides on a trysail-mast, batten, or jack-stay. For the gear of a gaff, see under proper heads.

A barbed iron instrument for spearing fish.

GAFF-HOOK. A strong iron hook set on a handle for landing large fish that have been caught with a hook and line.

GAFF-NET. A peculiar fishing-net.

GAFF-TOPSAIL. A light triangular or quadrilateral sail set above a gaff. It is seldom used in men-of-war, but forms a part of the rig of all fore-and-afters. For the gear of a gaff-topsail, see under proper heads.

Gage. See GAUGE.

Gained Day. See DAY, CIRCUMNAVIGATOR'S.

Gaining-twist. A term applied to the rifling of a gun when the twist is not uniform, but greater at the muzzle than at the breech.

Gain the Wind. To arrive on the weather side of another vessel when both are working to windward.

Gair-fish. A name for the porpoise.

Gair-fowl. A name of the great auk, *Alca impennis*.

Galaxy (Gr. *gala*, milk). The galaxy, or milky-way (*Via Lactea*), is the great luminous band which stretches across the sky and which forms a zone completely encircling the whole sphere, almost in a great circle. At one part it sends off a kind of branch which unites again with the main body, after remaining distinct for about 150 degrees. This remarkable belt has maintained from the earliest ages the same relative situation among the stars, and when examined through powerful telescopes, is found to consist entirely of stars scattered by millions, "like glittering dust on the black ground of the general heavens."

Gale. A storm. In a gale a ship must scud before it or lie-to. In the Beaufort scale the strength is denoted by 9, 10, 11, or 12, and the velocity is from 20 to 100 miles per hour.

Galeas. See GALLIAS.

Galeopis. An ancient war-ship with a prow resembling the beak of a sword-fish.

Gall. To chafe. See WINDGALL.

Gallants. Formerly, all flags carried at the mizzen were termed *gallants*.

Gallan Whale. The largest whale which visits the Hebrides.

Galleat, or Galliot. A galley having one mast and 16 to 20 oars; at one time used by most of the maritime nations of Europe. Also, a Dutch or Flemish merchant vessel with very rounded ribs and flattish bottom, with a mizzen-mast stepped well aft, carrying a square main-sail and main topsail, a fore-stay to the main-mast (there being no foremast) with fore-stay-sail and jibs. See SCAMPAVIA.

Galleon, or Galion. A name formerly given to ships of war having three decks with guns on each. Also applied to large Spanish merchant vessels, much used as treasure-ships; they were a ready prey on account of their unwieldiness.

Gallery. A balcony projecting from the after part of a ship. See QUARTER GALLERY.

GALLERY-LADDER. Synonymous with *stern-ladder.*

Galley. The cooking apparatus on board ship.

GALLEY-GROWLERS. A term applied to a class of grumblers and croakers on board ship who find fault with the food and spread idle rumors through the ship; hence the terms "galley-news" and "galley-yarn."

GALLEY-NEWS. See GALLEY-GROWLERS.

GALLEY-PACKET. The mythical ship which brings "galley-news."

GALLEY-PEPPER. Soot or ashes which drop into victuals in cooking.

GALLEY-SLANG. The neological barbarisms foisted into sea-language.

GALLEY-STOKER. A skulker.

GALLEY-YARN. An unfounded rumor. See GALLEY-GROWLERS.

Galley. French *galère*, derived from Ital. *galera*, and adopted by the French about 1500. The Italian *galera* was derived from the low Latin *galea*, a helmet, because the figure-head often consisted of a helmet. Ovid says, "*Navis; et a picta casside nomen habet.*" Some etymologists have thought that *galê*, the name applied to the weasel and the cat, was given to this species of vessel on account of its swiftness, slender form, and ease of manœuvre.

The name galley has been in modern times applied to vessels of war, using both sails and oars, which the ancients distinguished according to the number of benches of rowers, as biremes, triremes, etc. There is much uncertainty as to the rig and arrangement of the ancient galleys. It is, however, certain that they were used for war,—often very long, low, originally without a deck, and having one mast. Later, they were constructed with poop and forecastle, for the fighting men, and the masts were made to lower, as in the Roman galleys at the battle of Actium. The Greeks and Carthaginians generally kept their masts up during a fight, and kept hoisted at their yard-arms heavy masses of metal to be dropped upon their assailants, often causing them to sink. The Romans used grappling-hooks with which to hold their galleys fast to those of their enemy, and thus make the fighting hand-to-hand, in which case they were apt to be successful.

The ancient galleys were often armed with a metal spur, or *rostrum.* They were steered by 2 or even 4 broad oars, instead of a rudder.

All galleys in the beginning had only one rank of oars,—the *uniremes* of the Romans, *monêrês* of the Greeks. These galleys were distinguished among themselves by the number of oars, such as *triacontoros*, or 30 rowers, and *pentêkontoros*, or 50 rowers. It is said that the ranks of oars were gradually increased until, like the great vessel of Hiero, built by Archimedes, and that of Ptolemy Philopator, the ranks were raised to 40. Yet, as has been said, no modern has given a thoroughly satisfactory explanation of how these were arranged.

The modern galley was especially in use in the Mediterranean from the 12th to the 18th century. They were very fast, and capable of performing rapid evolutions, their breadth in relation to length being as 1 to 7, or even as 1 to 8 or 9. They were decked, steered by a rudder and tiller, and carried 2 or more lateen-sails, in later times, but the sails were originally square. Each oar was from 40 to 50 feet long, and manned by several men. An ordinary galley pulled 50 oars, and would have from 250 to 300 rowers. A walk or gangway, called the *coursier*, ran along the middle of the deck, along which passed the *comite*, or boatswain and his mates, for the purpose of making the rowers do their best.

Before the invention of gunpowder the sides of galleys were surmounted by a wall or bulkhead of planks, and they had small towers forward and aft, from which archers launched their projectiles. They were also armed with a spur of wood covered with iron. The use of fire-arms caused the towers and spurs to be abandoned, and a heavy piece of artillery and some smaller ones were mounted forward, behind a sort of bulwark called a *rambade.* To prevent boarding they had nettings stretched completely over the rowers and the main deck. The poop, which was higher than the prow, was also defended by bulwarks crenelated for musketry.

The system of recruiting for the rowers of the galleys differed much at different times. During ancient times the rower's place was considered an honorable one. Virgil mentions that the Trojan youth practiced continually at the oar. Later the oar was worked by prisoners of war and black slaves, the latter being especially used by the Carthaginians.

In the middle ages they chained to the same bench infidel prisoners and criminals; and in France justice showed herself more or less severe according to the need of rowers for the galleys. The loss of life in the French galleys was frightful. In 1676 the rowers numbered 4710, but death made such fearful ravages among them that every sort of vagabond was picked up, and even North American Indians were kidnapped for the purpose of being put to the oar.

The treatment of the galley-slaves was terrible, even after the great Colbert had interfered to obtain better treatment for them. Fed principally upon lentils and black bread, with a little fat or oil, and all in insufficient quantity, a traveler who wrote at the end of the 17th century says they were eaten by swarms of vermin and scaly with itch; dressed in a coarse sack, without shoes or cap, they slept upon the hard deck or bench, chained to it and to each other. If necessary during any manœuvre to insure silence, they were gagged. Other particulars still more revolting are given.

In some of the French dock-yards may still be seen galley-slaves working at the oar and performing other hard labor, but the system is fast dying out. The Algerines used galleys up almost to our own time. In 1748 the officers of the

French galleys, who had until then formed a separate corps, were merged in the navy.

The term *galley* was also applied to a ship's boat, generally built for speed.

GALLEY-ARCHES. Spacious and well-built structures in many of the Mediterranean ports for the reception and security of the galleys.

GALLEY-FOIST, or GALLEY-FUST. An obsolete term for a barge of state.

GALLEY-SLAVE. A person condemned to work at the oar on board a galley.

Gallias. A vessel larger and heavier than the ordinary galley; it had castellated structures at the bow and stern for the fighting men.

Gallied. Worried; rattled; thrown out of mental equilibrium.

Galligaskins. Wide hose or breeches formerly worn by seamen, also called petticoat-trousers.

Gallipoli. A seaport town of European Turkey, in Roumelia, on the Sea of Marmora, 132 miles W.S.W. of Constantinople. Lat. 40° 24′ N.; lon. 26° 40′ E. It has two ports, and is the principal station of the Turkish fleet. Pop. 20,300.

Gallipoli. A fortified seaport town of Naples, province of Lecce, 29 miles W.S.W. of Otranto, on a rocky island in the Gulf of Taranto, connected by a bridge with its suburb Lizza, on the mainland. The harbor is between the town and the island of Sant' Andrea, and is 10 to 12 fathoms in depth. Pop. 10,000.

Gallivat. An armed row-boat of India, smaller than a grab, generally 50 to 70 tons. It was built like a *grab*, but not so large; it had two masts with a large triangular sail on the main, and generally a deck made of split bamboo. They carried swivel-guns or small cannon, and sometimes pulled 50 oars, by which they were propelled at the rate of 4 miles an hour.

Gallows. A frame-work above the deck of a flush-decked vessel, used for stowing spare spars; called also *gallows-tops*, *gallows-bitts*, and *gallows-frames*.

Gally-gun. A kind of culverin.

Galore. Plenty; abundance.

Galvanic Battery. The use of electricity as a means of igniting explosive charges is of comparatively recent date. The earliest recorded application of this agent for such purposes was by Moses Shaw, an American, who, in 1831, exploded charges used in submarine blasting by means of an ordinary frictional machine, and who, later in the same year, by advice of Dr. Hare, substituted a galvanic battery for the electrical machine.

In 1839, Lieut.-Gen. Pasley, R.A., while conducting operations for the removal of the wreck of the "Royal George," at Spithead, used a galvanic battery for firing charges of powder. In the same year, Alan Stevenson also applied the same means in submarine blasting.

Probably the most noteworthy of the earlier applications of electricity to firing purposes was that made by William Cubitt, in 1843, when removing the Round Down cliff, on the line of the Southeastern Railroad, near Dover. This cliff was about 400 feet high, and in removing it three charges, containing in the aggregate 18,000 pounds of gunpowder, were fired simultaneously by means of a galvanic battery. The results of the explosion realized the most sanguine expectations of the projectors. Over 1,000,000 tons of chalk rock were thrown down in less than five minutes, £10,000 and twelve months' labor being saved to the company.

The introduction of the torpedo into modern warfare was followed by earnest attempts to so modify its firing apparatus as to place it more under control, thus rendering it safe to friends and less dangerous to handle. Electricity attracted almost immediate attention in this connection, and so satisfactory have been the results obtained by its use, that at the present time it is almost exclusively employed as a firing agent for torpedoes.

The sources of electricity best adapted to torpedo operations are three in number:

1. Contact between dissimilar metals, supplemented by chemical action,—illustrated by any form of galvanic battery.

2. Friction between insulators,—for example, Smith's machine.

3. Mechanical energy so applied as to bring about electro-magnetic induction,—Beardslee's and Farmer's machines.

Much inventive talent has been employed in devising machines of this last class, and, as a result, there is a large number of machines, varying very widely in their properties. They may, however, be divided into two general classes, viz., induction machines of the first class, commonly called magneto-electric machines, and induction machines of the second class, called dynamo-electric machines. The magneto-electric machines, of which Beardslee's machine is an example, give a current approximating to that derived from frictional sources. The dynamo-electric machines—Farmer's for example—give a current similar to that of the galvanic battery.

A source of electricity to be used in extended defensive operations should have the following properties:

1. Its power should be great.

2. It should be ready to act at all times.

3. There should be no expenditure of material when not in action.

4. It should, when used to fire any given torpedo, have no marked inductive influence on neighboring cables.

5. The fuze required should be safe, simple, little affected by climate or storage; should be of such a nature as to allow testing the condition of the circuit, from time to time, and should have such a resistance that moderately poor insulation of the leading wires will not prevent its firing.

6. It should be equally applicable to self-acting torpedoes and those fired at will.

Considered in reference to the above propositions, it will readily be admitted that frictional electricity is of but little value as a firing agent in this class of operations.

First. Although its power can be made as great as desired, it has always to be generated at the moment required, unless we go into a constant expenditure of material to keep the generator continuously in operation.

Second. The inductive influence of a current derived from frictional sources is very marked.

Explosions of fuzes in neighboring circuits have been experienced at the Torpedo Station, due to no other cause than this, and it is also probable that to the same cause were due the "spontaneous explosions" encountered by the Austrians in their earlier experiments.

Third. The fuze best adapted to frictional electricity is not only extremely sensitive and dangerous, but is also very liable to injury in storage, and renders it impossible to test the circuit at any time; but, above all, it has such a high resistance that the slightest defect in the insulation of the connecting wires will render it impossible to fire, no matter what may be the power of the machine used.

Fourth. Electricity from frictional sources cannot easily be used with self-acting or contact torpedoes.

Frictional electricity being then of little value in this class of operations, let us now consider how well induction machines will answer as a substitute. The current derived from the first class of these machines, approximating to that obtained from frictional sources, we would naturally expect that the same objections would apply. This is the case, the only advantage possessed by these machines being that the fuze required admits of testing, and is less sensitive, and therefore safer. It is, however, more liable to injury in transportation and storage, and has also a very high resistance, which prevents its use with poorly-insulated wires. The inductive influence of the current of these machines is not so marked, but is greater as the machines more nearly approach the frictional in the character of the current furnished.

Induction machines of the second class more nearly fulfill the required conditions. The inductive influence on neighboring cables is slight. They can be used, when in action, equally well with contact torpedoes or those fired at will. The fuze (platinum wire) best adapted to these machines is simple, safe, sure, offers every facility for testing, is but little affected by climate, transportation, or storage, and, at the same time, has very low resistance, and can be fired when the insulation of the leading wires is very defective. However, these machines are not ready to act at all times, unless machinery be provided for driving them, which involves a constant expenditure of material; for this reason they must be condemned for defensive operations.

Frictional and induction machines being thus disposed of, there is left only the galvanic battery.

1. The power of a galvanic battery is only a question of the number of cells used, and can be made anything desired.

2. It is always ready to act, requiring only that its circuit be complete.

3. In a properly constructed battery, properly cared for, there is but little or no expenditure of material, when not in action.

4. Its current has practically no inductive influence on neighboring cables.

5. The platinum wire fuze can be used, bringing with it all the advantages enumerated above, and enabling us, by simply increasing the number of cells, to overcome all reasonable defects of insulation.

6. It can be used indifferently with contact torpedoes or those fired at will.

7. It is easily procured, and in case of necessity, a fair battery may readily be improvised.

In view of all these points, the galvanic battery seems to be peculiarly adapted for use as a firing agent in defensive operations.

A good battery should have the following qualities: it should produce a high electro-motive force; its electro-motive force should be constant, whether used to produce strong or weak currents; it should have a small and constant internal resistance; the materials employed should be cheap and readily obtainable, particularly the material consumed; no material should be expended when the battery is not employed to produce a current. This last point is generally attained when the cells are properly insulated from each other, the battery itself well insulated, and the zincs carefully amalgamated.

The electro-motive force and resistance per cell of any form of battery are known as its *electrical dimensions*, and it is the relative values of these two quantities which must be the guide in selecting batteries for particular purposes.

The simplest form of galvanic battery consists of two plates of dissimilar metals plunged into a liquid. A copper and a zinc plate in dilute sulphuric acid or water are generally used. When the two plates are brought into contact or joined by a conducting wire, a current of electricity flows from the copper to the zinc, through the conducting wire, and from the zinc to the copper, through the liquid. The passage of the current through the liquid is attended by chemical action. The sulphuric acid attacks the zinc, forming sulphate of zinc and liberating hydrogen, which is carried over, and given off at the copper plate.

This battery is found to be of no practical use; its electro-motive force decreases rapidly, and at the same time its resistance is constantly increasing, until finally the action altogether ceases. This inconstancy has been found to be due to the action of the liberated hydrogen, which, instead of passing off at the copper plate, clings to it, generating an opposing electro-motive force, which subtracts from the original force of the combination. The hydrogen has still another detrimental action; after the circuit has been closed for some time, the sulphate of zinc formed permeates the whole solution; the hydrogen acts on this sulphate, depositing zinc on the copper plate, and thus weakening still further the battery. Attempts to so dispose of this hydrogen that its action shall not be detrimental have resulted in many more complicated forms, called *constant* batteries.

Daniell's battery consists of a zinc plate, in either a solution of sulphate of zinc, or dilute sulphuric acid, and a copper plate in a saturated solution of sulphate of copper. The two solutions are separated by a porous cup. To the sulphate of copper solution a little sulphuric acid is sometimes added to increase its conductivity.

This battery is very constant, particularly when the sulphate of zinc solution is kept at half saturation; its electro-motive force is about .98 volt, and its internal resistance varies from 4 to 10 ohms, according to size and construction. The plates used should be of the same surface, the copper being the larger, if either, and the zinc plate should be in the larger vessel.

The Gravity battery is a modification of Daniell's. In the bottom of a glass jar is a copper plate, surrounded by crystals of sulphate of copper; to the copper plate is soldered an insulated wire, which leads up to the top of the jar; the jar is filled with water, to which a little sulphate of zinc is sometimes added; in the top of the jar is suspended an annular zinc plate.

In the form of this battery in use at the Torpedo Station, the E. M. F. is about one volt, the resistance about 2.4 ohms. In one particular case, in which the copper plate is disposed as a band around the interior wall of the jar, the resistance is as low as 1.4 ohms.

In this battery the difference of the specific gravities of the two solutions keeps them separate; therefore, the battery should never be so agitated as to cause the solutions to mix. This battery is very constant, and with reasonable care can be used for months without re-setting.

The Le Clanché battery consists of a glass jar, and a porous cup which is glazed for half its length. In the porous cup is placed a carbon plate, surrounded by a mixture of gas carbon and the needle form of peroxide of manganese (black oxide). Both the carbon and the manganese should be sifted to get rid of any fine dust, which would materially interfere with the action of the battery. The top of the porous cup is sealed with pitch. The glass jar contains a zinc rod, and is half filled with a weak solution of ammonic chloride (sal-ammoniac). The E. M. F. of this battery is about 1.48 volts, and the resistance for the quart jar from 2.5 to 3 ohms.

The battery should not be used on short circuits where constant work is required, but for intermittent work it is valuable, constant, and requires but little care. A battery of this kind, carefully prepared at the outset, can be used for ten or twelve months without change, except to supply what the solution loses by evaporation. Sea-water is a very good substitute for the sal-ammoniac solution.

Grove's battery consists of a zinc plate in dilute sulphuric acid (generally one part of acid to ten or twelve of water), and a platinum plate in strong nitric acid, the two solutions being separated by a porous cap. The E. M. F. and resistance of this battery are reasonably constant; the latter, however, increases somewhat with the time the battery has been in operation. With the ordinary quart jar, the E. M. F. is about 1.8 volts, and the resistance from .3 ohm, when first set up, to .8 ohm, after working a few days.

Bunsen's battery is the same as the Grove, with the exception that carbon is substituted for platinum. The E. M. F. and internal resistance of the Bunsen are both somewhat greater than those of the Grove. The principal objection to both these batteries is the nitrous fumes given off, which are very unpleasant, and also particularly destructive to any electrical apparatus exposed to their influence.

Station battery.—At the Torpedo Station a modification of Bunsen's battery is much used; the porous cup is charged with a mixture of nitric acid and a solution of bichromate of potash (Gibb's solution). This solution is prepared as follows: a saturated solution of the bichromate is made, to which is added one-fourth its volume of strong sulphuric acid. In charging the battery, five parts of this solution are mixed with one part of strong nitric acid; dilute sulphuric acid (one to twelve) is used in the outer jar. The battery is reasonably constant; its E. M. F. is about two volts, and its resistance for the quart jar varies from .5 ohm, when first set up, to something over an ohm at the end of two weeks. No nitrous fumes are given off, which is a great advantage where instruments are used in connection with the battery.

Pneumatic battery.—A small compact battery invented by Lieut. J. P. Merrell, U.S.N. It is supplied to all government vessels for use in boats, for which it is very well adapted, being compact and transportable, and possessing sufficient power to fire through a resistance of 2.7 ohms. The liquid (Hertz's battery solution) is separate from the plates, and can only be brought in contact with them by blowing through a rubber tube attached to the outer jar.

Selection of batteries.—In torpedo work batteries are used for three distinct purposes, viz., signaling, testing, and firing. The qualities demanded in a signal or testing battery are identical; it must be constant and must give a weak current, certainly one 50 per cent. below that required to fire the fuze used. A firing battery, on the contrary, must be capable of generating a very strong current, and must have as great constancy as can be obtained without sacrificing this prime consideration.

The electrical dimensions of a battery form the only criterion by which to judge of the current which it is capable of producing; and it is evident that for a signal battery one should be selected which, being very constant, has, at the same time, a low E. M. F. and large internal resistance; while, for a firing battery, one of great E. M. F., low internal resistance, and fair constancy should be chosen.

For a signal or testing battery, either a Daniell, Gravity, or Le Clanché should be chosen, for they are all three very constant, and their electrical dimensions are suitable. Perhaps for a signal or a testing battery, where the work is not continuous, a Le Clanché would be the best, as it requires less care than any of the others; but for a testing battery, where the work is so much that it may practically be considered continuous, the Daniell or Gravity would be most suitable.

The Grove, Bunsen, and Station batteries, in point of electrical dimensions and constancy, are suitable for firing batteries. The Grove and Bunsen are, however, objectionable on account of the nitrous fumes given off, which soon destroy all electrical apparatus used in connection with the batteries. The Station battery of half-gallon jars makes a very efficient firing battery; its power is ample, and it is very easily cared for.

In the English service, a battery (known as Walker's battery) consisting of large plates of carbon and zinc plunged into very large vessels containing dilute sulphuric acid, has been adopted as a firing battery; and in this country a similar form, consisting of a plate of lead or chrome iron between two plates of zinc, the plates being very near together, has been recommended. In both these forms the plates are kept suspended over the acid, and are lowered when it is desired to fire. They may easily be so arranged as to be lowered by the action of the signal battery.

A portion of the firing battery may be used as a signal battery; but, as accident is possible with this arrangement, it should not be adopted when a suitable signal battery can be obtained. With either of the batteries mentioned above as suitable for signal purposes the torpedo cannot be fired, no matter to what extent the cells may be multiplied, provided they are always connected

in series; for this reason, signal batteries should always be connected *in series*.

Arrangement of battery cells.—Batteries are not always arranged in the same way, but are differently grouped, according to the results desired. The positive pole of one cell may be connected to the negative pole of the next, in which case the battery is said to be connected *in series*; or, the positive poles may all be connected together, and also the negative, which connection is said to be for *conductivity*; and last, the cells may be grouped, *i.e.*, part connected *in series* and part for *conductivity*. See ELECTRICITY.

Electrical measurements.—A knowledge of the strength of current required to fire the fuzes used, of the resistance of the circuit, and of the dimensions of the battery chosen, must determine the number and arrangement of the cells of a firing battery. The current necessary to fire a given fuze is practically a constant quantity, and should be determined in the laboratory, and furnished with the fuzes. The resistances of the circuits and dimensions of the batteries being subject to change from a variety of causes, a satisfactory knowledge of their value can only be obtained by actual measurement. In a well-conducted system of torpedo defense, such measurements would be made and recorded daily, thus giving a positive indication of the parts of the system needing attention or repairs, and particularly of the time when the batteries should be renewed.

These measurements are all based on well-known electrical principles, which, together with a description of some of the instruments used, are given below.

The units used are the *ohm*, *volt*, and *weber*. *The ohm* is the *unit of resistance*, and is the resistance offered by a round wire of pure copper, 10′ long and .01″ in diameter, at 42° F.

The volt is the unit of E. M. F., the E. M. F. of the Daniell or Gravity cell being a rough approximation to the unit.

Strength of current is defined as the quantity of electricity which flows by any section or point of a conductor in a given time, and is expressed in *webers*, the weber being the unit quantity in a second of time. The unit quantity is a *farad*; a weber current will be, then, one in which a farad passes every point of the conductor in a second of time.

A tangent galvanometer and box of resistance coils will suffice to make all the measurements likely to be required in torpedo practice.

A box of resistance coils consists of a number of spools of fine German silver or platinum silver wire placed in a box, and so arranged that one or all of them may be conveniently introduced into a circuit. The wire on the spools is carefully insulated, wound on the bight, and that on each spool has a definite resistance. Such values are generally given to the spools that, by different combinations, any resistance from 1 ohm to 10,000 ohms may be obtained.

A tangent galvanometer is an instrument used for measuring strengths of current, and, indirectly, resistances of conductors. It consists generally of a fixed coil of wire, so placed as to influence a compass-needle; the radius of the coil should be large in proportion to the length of the needle. The arc of the compass is graduated to degrees and fractions of a degree, ranging from 0°, at the north and south points, to 90°, at the east and west points.

If a current is passed through the instrument, the compass-needle will be deflected to the right or left, according to the direction of the current, and the tangent of the angle of deflection of the needle will be proportional to the strength of the current. The number of turns and the resistance of the wire in the coil determine the adaptability of the instrument to different classes of measurements. When in use, the instrument is so adjusted that the coil lies in the plane of the magnetic meridian when the needle stands at zero.

Farmer's modification of the Gaugain galvanometer is a very useful form of this instrument. It consists of four vertical coils of wire, placed two on each side of the needle, their centres being on the same horizontal line; between the coils is a compass, with a circle graduated, as above described. The point of suspension of the needle lies in the same horizontal line as the centres of the coils, and at a distance from the centre of each coil equal to one-half the radius of the coil; this having been found to be the best construction. One coil on each side consists of a number of turns of fine insulated wire, and has a resistance of 24 ohms; and the other of one turn of very coarse copper wire, whose resistance is practically zero.

At the front of the instrument is a key-board, so arranged that, by placing the pins properly, a current may be sent through either fine coil, through one fine coil after the other (tandem), in branch circuits through the two fine coils (team), and in the same ways for the coarse coils, thus giving virtually six different galvanometers in the one instrument. At the rear of the galvanometer is a commutator, by which the direction of the current through the instrument can be reversed.

Table of Batteries.

Size of Cell.	Name.	E. M. F. per Cell.	Resistance per Cell.	Constancy.	Used for—
Quart.	Daniell...............	0.98 volt.	4 to 6 ohms.	Very constant..................	Testing and signaling.
"	Gravity	1 "	2.4 "	" "	" "
"	Gravity (with copper band).	1 "	1.4 "	" "	Firing on short circuits, dangerous for signaling.
"	Le Clanché.........	1.48 "	2.5 to 3 "	Very constant on long circuits or for intermittent work on short circuits.	Testing and signaling, particularly for signaling.
"	Grove and Bunsen	1.8 "	0.3 to 0.8 "	Fairly constant................	Firing, bad for instruments.
"	Station..............	2 to 1.8 volts.	0.5 to 1 "	" "	Firing.
½ gal.	Station..............	2 to 1.8 "	0.25 to 0.5 "	" "	"

Galvanized Iron. Iron the surface of which is alloyed with zinc. The iron is cleansed, heated, and plunged into a bath of melted zinc covered with sal-ammoniac.

Galvanometer. An instrument for measuring electric currents. See GALVANIC BATTERY.

Galveston. A port of entry and the most populous and commercial city of Texas, situated on the Gulf of Mexico, on Galveston Island, in Galveston Bay. Lat. 29° 18′ N.; lon. 94° 50′ W. The harbor, which is the best on the Texas coast, has 12 or 14 feet of water over the bar at low tide. The chief articles of export are cotton, hides, grain, and pork. Value of annual exports about $33,000,000. Steamships make regular trips from this port to New York, Havana, Liverpool, etc. Pop. 31,000.

Galway. A town and seaport on the west coast of Ireland, situated on the north side of Galway Bay. Lat. 53° 15′ 12″ N.; lon. 9° 3′ 30″ W. The commerce of the town was at one time considerable, but has now declined. Pop. 16,000.

Gama, Vasco da, the discoverer of the maritime route to India, was born at Sines, a small seaport of Portugal. In what year he was born is not known. Five years after the corroboration by Columbus of the spherical form of the earth, and the successful exploration by Diaz of the passage round the Cape of Storms, the King of Portugal dispatched three vessels under Da Gama to find the shores of India and open a traffic with the people. The voyage, well described by Camoens in the "Lusiad," was perfectly successful. After establishing communication with the natives of Hindostan at Calicut, on the Malabar Coast, Da Gama returned to Portugal in 1499. The rejoicings of the court and the people were boundless,—wealth and power were in their grasp. A second expedition, on a larger scale than the first, was equipped, and Da Gama placed in command. Proceeding along the eastern coast of Africa, he landed at some places to punish the Moors for certain treacheries practiced on him during his former voyage; he continued his voyage, and, reaching Cochin in the south, he founded a port and factory. From that date the commerce of Europe with India, round the Cape of Good Hope, was established, and the wealth and consequence of the Italian republics declined in proportion as the traffic was withdrawn from the Red Sea route. He died at Cochin, December, 1525. His body was conveyed to Portugal and buried with great pomp.

Gambling. Gambling is strictly prohibited on board men-of-war; even card-playing is interdicted except in the cabin of the commanding officer.

Gammon. To pass the gammoning to secure the bowsprit. Humbug; hoax.

GAMMONING. Seven or eight turns of a lashing passed over the bowsprit and through the gammoning-hole, to secure the bowsprit. The lashing was formerly of rope, later of galvanized chain, and is now superseded by iron bands setting up with nuts and screws. When rope or chain was used the turns of the lashing were crossed, the forward turn on the bowsprit being the after turn in the gammoning hole.

GAMMONING-FASHION. A term applied to a lashing in which the turns cross after the manner of the gammoning.

GAMMONING-FISH. A batten on the upper side of the bowsprit, over which the turns of the gammoning were passed.

GAMMONING-HOLE. A scuttle cut through the knee of the head, through which the gammoning was passed.

GAMMON-KNEE. A knee-timber bolted to the stem just below the bowsprit.

GAMMON-PLATE. An iron plate bolted to the stem of some vessels to support the gammoning.

GAMMON-SHACKLE. The shackle of the gammon-plate.

Gand-flook. A name of the saury-pike, *Scomberesox saurus.*

Gang. A number of the ship's crew employed on any particular service and under the charge of an officer or petty officer.

Gang-board. A plank with several cleats nailed to it for convenience in passing back and forth from a vessel to the wharf.

Gang-cask. A small barrel used for bringing water on board in boats; larger than a breaker.

Gang-plank. See GANG-BOARD.

Gangway. Formerly, in deep-waisted ships, a platform from the poop to the topgallant forecastle; the name is now applied to that portion of the spar-deck over which this platform extended. A thoroughfare of any kind; but more especially applied to the aperture in the ship's side for the accommodation of persons entering and departing. *To bring to the gangway*, to bring a seaman to that place to be flogged.

GANGWAY-LADDER. The ladder extending from the gangway to the water's edge; the accommodation-ladder.

Ganneret. A species of gull.

Gannet. The *Sula bassana*, or solan goose, a large sea-bird of the family *Pelecanidæ*, common on the Scottish coasts.

Ganoidian. One of an order of fishes characterized by having shining bony scales or plates, the gills as in ordinary fishes, but the optic nerve not decussating. The ganoids were among the earliest of fishes in geological time, and became afterward very numerous, but are now of few species. The order includes the modern gar and the sturgeon.

Gantan. An Indian commercial measure, of which 17 make a baruth.

Gant-line. Synonymous with *girt-line* (which see).

Gant-lope, or Gauntlope (commonly pronounced *gantlet*). A race which a criminal was sentenced to run, in the navy or army, for some heinous offense. The ship's crew, or a certain division of soldiers, were disposed in two rows face to face, each provided with a knotted cord, with which they struck the delinquent as he ran between them, stripped down to the waist. This was repeated according to the sentence, but seldom beyond three times, and constituted *running the gauntlet.*

Gantree, or Gantril. A wooden stand for a barrel.

Gape. The principal crevice or crack in shaken timber. The seams *gape*, or let in water.

Gaper. A fish with six or seven bands and tail undivided.

Garbel. A word synonymous with *garboard* (which see).

Garbling. The mixing of rubbish with a cargo stowed in bulk.

Garboard-strake, or Sand-streak. The first range of planks laid upon a ship's bottom, next the keel, into which it is rabbeted, and into the stem and stern-post at the ends.

Gare. See GAIR-FOWL.

Gar-fish. The *Belone vulgaris*, or bill-fish, the bones of which are green. Also called the *guard-fish*, but it is from the Anglo-Saxon *gar*, a weapon.

Garganey. The *Querquedula circia*, a small species of duck, allied to the teal.

Garland. A collar of ropes formerly wound round the head of the mast to keep the shrouds from chafing. A strap lashed to a spar when hoisting it in. A rope grommet, to place shot in on deck. A wreath made by crossing three small hoops, and covering them with silk and ribbons; in early times it was hoisted to the main-topgallant-stay on the day of the captain's wedding; but on a seaman's wedding, to the appropriate mast at which he was stationed. Also, a sort of net used by sailors to contain their provisions, being hung up safe from cats, rats, ants, and cockroaches.

Garnet. A sort of purchase fixed to the main-stay of a merchant ship, and used for hoisting the cargo in and out. A pendant rove through a hole in the spar-deck and hooked to the cascabel of a gun in getting it out or taking it in through a port. See CLEW-GARNET.

GARNET-TACKLE. The tackle hooked to the upper end of the garnet,—the pendant-tackle.

Garney. A term in the fisheries for the fins, sounds, and tongues of the cod-fish.

Garnish (*Eng.*). Profuse decoration of a ship's head, stern, and quarters. Money which pressed men in tenders and receiving-ships exacted from each other according to priority.

Garr. An oozy vegetable substance which grows on ships' bottoms.

Garrooka. A fishing-craft in the Gulf of Persia with overhanging bow and stern.

Garter-fish. A fish having a long, depressed body, like the blade of a sword; the *Lepidopus.*

Garters. A slang term for leg-irons.

Garth. A fish-weir.

Gas-check. A ring or plate of metal designed to prevent the escape of gas in breech-loading arms.

Gasket. Plaited stuff or a small line used to confine a sail to its yard when furled. The *harbor-gaskets* are made of plaited stuff painted black, and receive different names according to the positions they occupy; as, yard-arm-, quarter-, and bunt-gaskets; the yard-arm- and quarter-gaskets are passed square, and the bunt-gaskets cross each other,—they are sometimes stitched together at the cross, and sometimes a net is wove between them. A *sea-gasket* is a long line which is passed around the yard and sail; it is used at sea when neatness is not so much an object as security; it is sometimes called a *furling-line.* A ring of india-rubber, canvas, sheet-lead, or other packing material, placed between flanges, such as those of cylinders, pipes, man-hole plates, etc., for the purpose of making a steam-, water-, or air-tight joint.

Gat. A swash-way or channel among shoals.

Gate, or Sea-gate. When two ships are thrown on board one another by a wave they are said to be in a *sea-gate.*

Gather Aft. To take in the slack of a sheet which has been flowing.

Gather Way. To begin to feel the impulse of the wind on the sails, so as to obey the helm.

Gath-linn. A name of Polaris,—from two Gaelic words signifying ray and moisture, in allusion to its subdued brightness.

Gatling-gun. See MACHINE-GUNS.

Gaub-line. See GOB-LINE.

Gauge. To measure. A standard of any kind. An instrument to ascertain or regulate the dimensions or form of any particular thing. (See GUNS, INSPECTION OF.) Position of a vessel with regard to the wind and another vessel. *To have the weather-* (or *lee-*) *gauge*, to be to windward (or to leeward) of a vessel. In former days it was considered very important to have the weather-gauge, and fleets sometimes manœuvred for hours to obtain this advantage.

GAUGE-COCK. One of a number of small cocks inserted in the shell of a steam-boiler at about the proper water-level, which indicate, by the small jet of steam or water drawn from them, the height of the water in the boiler. One cock is placed at the lowest limit of safety, one at the highest, and one or more placed at equal distances between them. The steam-jet, water-jet, and a mixture of the two, are easily distinguished either by sight or sound. There are many varieties of gauge-cocks.

GAUGE-ROD. A rod provided with a hook and handle for operating gauge-cocks when beyond reach of the hand. A rod or stick of light wood used as a float in a mercury siphon gauge, usually called a gauge-stick. Any rod, graduated or not, used to gauge or measure the distance between two points.

Gaugnet. The *Sygnathus acus*, sea-needle, or pipe-fish.

Gaut. In the East Indies, a landing-place; also, a range of hills.

Gavelock. An old term for a pike.

Gaver. A name for the sea cray-fish.

Gavial. A genus of reptiles of the crocodile family inhabiting the Ganges; it differs from the true crocodile and alligator in the great length and slenderness of the muzzle.

Gaw. A term for a boat-pole.

Gawdnie. The dragonet or yellow gurnard, *Callionymus lyra.*

Gaw-gaw. A lubberly simpleton.

Gawky. The shell called horse-cockle. Awkward; lank.

Gawlin. A small sea-fowl which the natives of the Western Isles of Scotland trust in as a prognostication of the weather.

Gawpus. A stupid, idle fellow.

Gawrie. A name for the red gurnard, *Trigla cuculus.*

Gaydiang. A vessel of Anam, resembling in construction a Chinese junk.

Gazzetta. The name of a small coin in the Adriatic and Levant. It was the price of the first Venetian newspaper, and thereby gave the name to those publications.

Gear (Ang. Sax. *geara*, clothing). A general name for ropes belonging to any particular spar or sail; and for the implements used in any operation; as, *shaving-gear*, *mess-gear*, etc.

Gearing. A combination of wheels and pinions, or shafts and pulleys.

Gears, or Geers. See JEERS.

Gee. To suit or fit; to answer the purpose required.

Geelong, a town and seaport of Victoria, S.E. Australia, near the head of Geelong harbor, an arm of Corio Bay, 40 miles S.W. of Melbourne. Lat. 38° 8′ S.; lon. 144° 25′ E. The harbor, naturally good, has been much improved by dredging and by construction of jetties. Pop. 15,200.

Gefle. A fortified seaport town of Sweden, at the mouth of the Gefle River. The river here separates into three arms, inclosing two islands, on which and on both banks the town is situated. The harbor is excellent. It has ship-yards, sugar-refineries, and tanneries, and exports iron and agricultural products. Pop. 17,700.

Gellywatte. An old term for the captain's boat,—the origin of jolly-boat.

Gemini, Constellation of (*Lat.* "The Twins"). The third constellation of the zodiac, lying between Taurus and Cancer. The two principal stars are α^2 *Geminorum* called *Castor*, and β *Geminorum* called *Pollux*. They may at once be found, as they form, with the two bright stars of Auriga, an arch round the head of Orion. As they rise, Capella is the uppermost star of the pair in Auriga, and Castor is the uppermost of the pair in Gemini; or, again, a line joining Rigel and Betelgeux, and continued a little more than its own length, gives Pollux, and is also bisected by γ *Geminorum.*

GEMINI, SIGN OF. The third sign of the ecliptic, including from 60° to 90° longitude. Owing to the precession of the equinoxes, the sign is at present in the constellation Taurus. The sun is in Gemini from about 21st May to about 21st June. Symbol Π.

Gemma (*Lat.* a jewel). The star α *Coronæ Borealis.*

General Average. See AVERAGE.

General Orders. Orders relating to the whole command, in contradistinction to *special* orders, or those relating to only a portion of the command.

General Ship. When persons unconnected with each other send freight in a ship she is called a *general*, in contradistinction to a *chartered*, ship.

Generator. An apparatus in which vapor or gas is formed from a liquid or solid by means of heat or chemical process, as a steam-boiler, gas-retort, or vessel for generating carbonic acid gas, etc. Also, a machine for transmuting work into electricity.

Genoa, a fortified seaport of Northern Italy, on the Mediterranean, between the rivers Bisagno and Polcevera. Lat. 44° 24′ 54″ N.; lon. 8° 53′ E. The city is inclosed by a double line of fortifications, forming a vast semicircle, supported by numerous detached outworks, constituting one of the most extensive town fortifications in Europe. The port is of a semicircular form, about three-quarters of a mile in diameter, formed by two moles projecting into the sea from opposite sides, but not opposite each other. There are yards for naval construction. The harbor is safe and good, but much too small for the needs of the port; hence new harbor works are in course of construction. Pop. 161,700.

Gentle. A grub used as bait in angling.

Gentle Airs. Breezes which are barely appreciable, not exceeding a velocity of 1.5 miles per hour; they are indicated by 1 on the Beaufort scale.

Geocentric (*gē*, the earth; *kentron*, the centre). Concentric with the earth; distinguished from *heliocentric*, concentric with the sun. The geocentric place of an object is its position referred to a celestial sphere having the centre of the earth for its centre; the heliocentric place is its position referred to a celestial sphere concentric with the sun: the former supposes the spectator to be in the centre of the earth, the latter in the centre of the sun. Thus, we have geocentric longitudes and latitudes, and heliocentric longitudes and latitudes.

Geodesy. The science of the measurement of the earth's surface, and of great portions of it. Geodesy has many physical difficulties to contend against. In measuring a particular length with a view to obtaining a base-line for calculating other lines by trigonometrical observations, there is first a difficulty arising in the use of the unit of length, whatever it may be, whether rod or chain. In the use of rods, it is difficult to lay them all precisely in the same direction, and to prevent error arising from intervals between the rods. In the use of chains, again, the greatest care is needed to keep all the links stretched, while the difficulty of avoiding error through not preserving the line of direction is but little diminished. Further, in all cases, the tendency of the units to change magnitude with changes of temperature, and the unevenness of the earth's surface, are prolific sources of error. After all these difficulties have been overcome and a sufficient base-line obtained, a new class of difficulties are encountered. In taking trigonometrical observations of distant objects, it is found that the three angles of any triangle which we may form are together in excess of two right angles; the angles are, in fact, more of the nature of spherical than plane angles. For this, in using the angles as plane angles (for greater simplicity), a correction has to be made. Further, a correction is required for the effect of horizontal refraction on the results of observations of distant objects,—a most fluctuating source of error, to evade which, as far as possible, it is usual to make observations when the atmosphere has been for some time undisturbed. See COAST SURVEY.

Geo-graffy. A beverage made by boiling burnt bread in water.

Geo-navigation. A term proposed by some writers to distinguish that branch of navigation in which the position of the ship is determined by dead-reckoning, cross-bearings, soundings, etc., from the other branch in which the position is determined by observations of the heavenly bodies, which by them is distinguished as *celo-navigation.*

Georgetown. Capital of British Guiana, on the east bank of the Demerara River, at its mouth. The town has a good water-supply, and has telegraph-lines to America and Europe *via* Cuba and Brazil. There is a bar at the river's mouth with but 8 feet of water, and large ships discharge and load by means of lighters. Pop. 37,000.

Georgium Sidus. The planet discovered by Sir W. Herschel was so named at first; but astronomers adopted Uranus instead, as safer to keep in the neutral ground of mythology.

Gerletroch. The *Salmo Alpinus*, red char, or galley-trough.

Germany, Navy of. There was scarcely any naval establishment in Germany prior to 1848, and even at that time it was begun on a small scale. The unification of the empire, the consequent accession of additional ports, and the augmented warlike contingencies have, however, accelerated the growth of the armament, and by the latest available returns the navy consisted of 20 ironclads, 59 unarmored steamers, and 4 sailing-vessels. In addition to the vessels named, there are two or three torpedo-steamers, protected by steel armor, and capable of moving at the rate of 20 knots per hour. Five thousand five hundred men and boys man the German navy, which is officered by 1 admiral, 1 vice-admiral, 4 rear-admirals, 68 captains, and 351 lieutenants. There are, besides, 10 companies of marines, 6 of infantry, and 3 of artillery, numbering 1500 men. Conscription is the rule of recruitment in Germany, both in the navy and army.

Gerrack. A coal-fish in its first year.

Gerret. A samlet or parr.

Gerrick. A name for a sea-pike.

Gerron. A name for the sea-trout.

Ghee (*Eng.*). The substitute for butter served out to ship's companies on the Indian station.

Ghost. A false image in the lens of an instrument.

Giant-powder. See EXPLOSIVES.

Gib. A term sometimes applied to the projecting arm of a crane or derrick. A piece of metal or wood to hold another in place. *Gib and key*, the fixed wedge and the driving wedge for tightening the strap which holds the brasses at the end of a connecting-rod, or other rod of a steam-engine. Short for Gibraltar.

Gibb. The beak or hooked lip of a male salmon.

Gibbous. A term descriptive of the shape of the disk of a heavenly body when it assumes a form intermediate between a circle and a semicircle.

Gib-fish. A name for the male of the salmon.

Gibraltar. A town and strongly fortified rock at the southern extremity of Spain, belonging to Great Britain. Lat. 36° 9′ N.; lon. 5° 21′ W. The immense strength of the fortress excites wonder and admiration, and renders it impregnable; it is the ancient Calpe, which, with Abyla on the opposite shore of Africa, obtained the name of the Pillars of Hercules. The height of the rock, according to Cuvier, is 1437 English feet: it was taken by the Saracens under Tarik (*Gibel-Tarik*, Mountain of Tarik, whence its present name) in A.D. 712. In the year 1462 the king of Castile took Gibraltar from the Moors; and the English, under Sir George Rooke, the Prince of Hesse-Darmstadt, Sir John Leake, and Admiral Byng, bravely won it, July 24, 1704. It was surrendered, after a dreadful cannonade, to the British, by the governor, the Marquis de Salines, and it has since continued an appendage to the British crown. The principal buildings are the governor's and lieutenant-governor's houses, the admiralty, naval hospital, victualing office, and barracks. Pop., including the garrison, 26,470.

Giddock. A name for the sand-launce or sand-eel, *Ammodytes tobianus*.

Giffoot. A Jewish corruption of the Spanish spoken at Gibraltar.

Gift-rope, or Guest-rope. An old name for the line by which a boat makes fast to the swinging-boom. See GUEST-WARP BOOM.

Gig. A long, narrow boat used by the commanding officer; it is generally clinker-built and single-banked. A sort of spear for taking fish.

GIGSMAN. One of the gig's crew.

Gijon. A fortified seaport town of Spain, on the Bay of Biscay. The town contains ship-yards, a school of navigation, and a large public library. Pop. 6600.

Gilbert, Sir Humphrey. This brave man, who has often been called the real founder of the empire of North America, made himself conspicuous by his services as a British soldier in the first instance, and afterwards as an adventurer in the interest of a party who had obtained Queen Elizabeth's leave to occupy and colonize Virginia. The patent which Sir Humphrey obtained authorized his discovery and possession of any lands that might be yet unsettled. Sir Humphrey made two attempts to reach the shores of Virginia and the Carolinas, but he could not get beyond Newfoundland. Here he took possession of the harbor of St. John's, and then returned to England to die. He left behind him a good name as a valiant soldier, an able navigator, and a sound arithmetician.

Gildee. A name in the Scottish isles for the *Morrhua barbata*, or whiting-pout.

Gil-guy. A name applied to various devices for expediting manœuvres, especially when the device is not very efficient.

Giller. A horse-hair fishing-line.

Gills. Small hackles for drying hemp.

Gilpy. Adolescent.

Gilse. Misnomer for *grilse*.

Gilt-head, or Gilt-poll. The *Sparus aurata*, a fish of the European and American seas with a golden mark between the eyes.

Gimbals (formerly *Gimmals*, akin to Lat. *geminus*, double). Pairs of brass hoops or rings which swing one within the other on diameters at right angles to each other, the pivots being on the inner surface of each successively larger hoop. Anything suspended in their centre retains a constant position relatively to the horizontal plane in whatever direction the framework is tilted; used for hanging compasses, barometers, etc.

Gimlet-eyed. Keen-eyed.

Gimmals. The old form for *gimbals* (which see).

Gin, or Gin-block. An iron frame fitted with a metal sheave; used for topsail-tyes, and for whips for loading and discharging cargo.

Gingado. See JERGADO.

Gingal, or Jingal. A long-barreled fire-arm used in the East, especially in China; it frequently loads at the breech.

Ginger. To spur up; to revive one's flagging energies.

Gingerbread-work. Carved decorations.

Gingerly. Fastidiously; daintily; cautiously.

Ginners, or Ginnles. The gills of fish.

Ginseng. A Chinese root, formerly highly prized for its restorative virtues. It is now almost out of the *Materia Medica*.

Gip. To take the entrails out of fishes.

Girandole. Any whirling fire-work.

Girdle. An additional planking over the

wales or bends. A frapping for girding a ship.

Girt. The situation of a ship which is moored so taut by her cables, extending from the hawse to two distant anchors, as to be prevented from swinging to the wind or tide. The ship thus circumstanced endeavors to swing, but her side bears upon one of the cables, which catches on her heel, and interrupts her in the act of traversing. In this position she must ride with her broadside or stern to the wind or current, till one or both of the cables are slackened, so as to sink under the keel; after which the ship will readily yield to the effort of the wind or current.

Girt-line. A rope passing through a single block at the head of a mast to hoist up the rigging; the girt-line is the first rope employed to rig a ship, and the last in unrigging. *Hammock girt-lines*, lines extending from jib-boom to spanker-boom, on which scrubbed hammocks are stopped to dry. *Stripped to a girt-line*, entirely stripped; naked.

Give. To yield to force or pressure.

Give a Spell. See Spell.

Give Chase. To pursue another vessel.

Give her Sheet. To ease off the sheet.

Give the Calf more Rope. An expression conveying an indirect request for silence, addressed to one who is making an unusual or unnecessary noise, which thus is likened to that caused by the uneasiness of the tethered calf.

Give Way. To commence rowing. To row with more vigor. *Give way together*, to pull together. *Give way with a will*, to pull heartily.

Gladene. A very old designation of the sea-onion.

Glance. A dark-colored metallic sulphuret. A name for anthracite coal. See Northern Glance.

Gland. In mechanism, a piece of metal consisting of a cylindrical ring fitted to the annular space between a rod or valve-stem and the interior of its stuffing-box, provided with a flange by which it is secured and adjusted either by bolts and nuts, or by a large nut encompassing the outside of the stuffing-box; its use being to confine and adjust the packing.

Glasag. A certain kind of edible sea-weed.

Glasgow. The commercial and manufacturing capital of Scotland, on both sides of the Clyde, 21 miles from its mouth. Lat. 55° 51′ 52″ N.; lon. 4° 16′ W. When by the union of England and Scotland the trade with the American colonies was thrown open to Scottish enterprise, Glasgow became the centre of the tobacco trade; later it became a great centre of the sugar trade, and this trade the town still retains. Her special business consists of iron-ship building and machine-making, and the Clyde-built steamers and engines are world-renowned. In the beginning of the century, the Clyde below the lowest bridge could be forded on foot, now vessels of 2000 tons can lie at anchor at all states of the tide. An excellent harbor has been constructed in the city on the Forth and Clyde Canal. Pop. 700,000.

Glass. A sailor's name for anything made of glass; as, the barometer, telescope, etc. *How is the glass?* how is the barometer? The *glass* is said to be falling or rising as the mercury falls or rises.

A *time-glass* was formerly employed to mark the flight of time; hence *glass* was used to denote the length of time the sand occupied in running out. *To flog* or *sweat the glass*, to hasten the running of the sand by agitation, or to turn it a short time before the sand is out. Twenty-eight-second and fourteen-second glasses are still used to mark the time in heaving the log. *Clear glass!* To let the sand run out of one end before the chip is hove overboard. *To cook a glass*, to heat it, and thus absorb the moisture collected on it; applied to time-glasses and telescopes. *Night-glass*, a telescope adapted to viewing objects at night; it has a large field of view, and concentrates a large amount of light. *Spy-glass*, a telescope.

Glassok. A name of the say, seath, or coal-fish.

Glasson, John J., Commodore U.S.N. Born in New York City. Appointed midshipman from New York, February 1, 1823; served in the store-ship "Decoy" and schooner "Fox," in the West India Squadron, fitted out by special act of Congress for the suppression of piracy, which was successfully accomplished under the command of Commodore David Porter, 1823; schooner "Grampus," coast of Africa and West Indies, 1824; in the "North Carolina," 74, and sloop "Warren," Mediterranean, 1825–29; sloop "Natchez," West Indies, 1830.

Promoted to passed midshipman, June 4, 1831; revenue-cutter "Rush," as first lieutenant in the Revenue Marine. "New York," 1831–32; schooner "Shark" (as master), Mediterranean, 1833–34; rendezvous, New York, 1835–37.

Commissioned as lieutenant, February 9, 1837; sloops "Lexington" and "Falmouth," in the Pacific, 1838–40; steamer "Fulton," on special service, New York harbor, 1841–42; sloop "Decatur," coast of Africa, 1843–44; store-ship "Lexington," with troops to the coast of Texas, 1845; steamer "Spitfire" (executive) and schooner "Falcon," Home Squadron, 1846–48; commanded the latter vessel in the attack on Vera Cruz, and the Castle of San Juan de Ulloa, which were captured by the joint action of the army and navy; also in the rescue of 121 inhabitants of the town of Valladolid, Yucatan (burned and sacked by the Indians in a state of insurrection), landing them safely at the city of Campeachy.

Commissioned as commander, September 14, 1855; commanding rendezvous, New Bedford, Mass., 1861–63; navy-yard, Norfolk, Va., in charge of stores for the supply of the Coast Squadron in the Atlantic, and the flotilla forces in the Chesapeake, 1864–65.

Commissioned as commodore, September 28, 1866. Sea service, 17 years 11 months; shore or other duty, 8 years 10 months. Retired October 1, 1864.

Glaucus. A genus of nudibranchiate mollusks, found in the warmer latitudes floating in the open sea, beautifully colored with blue.

Glave. A light hand-dart. Also, a sword-blade fixed on the end of a pole.

Glazed Powder. See Powder.

Glent. To turn aside or quit the original direction, as a shot when it impinges on a hard substance.

Glib-gabbet. Smooth and ready speech.

Glim. A light; familiarly used for the eyes. *Douse the glim*, put out, or cover up, the light.

Glisson, O. S., Rear-Admiral U.S.N. Born in Ohio. Appointed midshipman from Indiana, November 1, 1826.

Promoted to passed midshipman, June 4, 1832; in the "Delaware," 74, Mediterranean, 1832–35.

Commissioned as lieutenant, February 9, 1837; sloop "Marion," West India Squadron, 1841–42; sloop "Saratoga," Brazil Squadron, 1843–44; commanding schooner "Reefer," during the Mexican war, 1847; attached to steam-frigate "Powhatan," East India Squadron, and on the Japan Expedition, 1852–55,—was in Japan when the first treaty was made by Commodore M. C. Perry.

Commissioned as commander, September 14, 1855; commanding steamer "Mount Vernon," North Atlantic Blockading Squadron, 1861.

Commissioned as captain, July 16, 1862; while in the "Mount Vernon," saved the transport "Mississippi," bound to New Orleans, with Gen. Butler and 1500 men on board. It was supposed that she was designedly run on Frying-pan Shoal, N. C.; and had it not been for the timely assistance of the "Mount Vernon," it is very probable that many lives would have been lost. By this valuable service being rendered, Gen. Butler was enabled to reach New Orleans in time to participate in that great battle. While on the blockade of Wilmington, he burned a light-boat under the guns of Fort Caswell, so close that they could hear the sentinels calling "all's well." This light-boat was all ready to receive her battery of 8 guns, and would have been put in commission in a few days.

Commanding steam-sloop "Mohican," 1862–63, in chase of the "Alabama"; commanding steamer "Santiago de Cuba," 1864–65; present at the two attacks on Fort Fisher, December, 1864, and January, 1865; commanded the Third Division in both engagements; was recommended by Admiral Porter for promotion for covering the landing of the troops and carrying his division into action.

Commissioned as commodore, July 25, 1866.

Commanding Naval Station, League Island, Pa., 1867, to May 1, 1870.

Commissioned as rear-admiral, June, 1870, and ordered to the command of the European Fleet, where he remained until retired, on January 18, 1871.

Gloaming. The twilight. Also, a gloomy, dull state of the sky.

Globe (Lat. *globus*). A word synonymous with sphere, but generally restricted to mean the earth. An artificial spherical representation of the earth or heavens.

GLOBE-FISH. A fish of the genus *Diodon* or the genus *Tetraodon*, which, by inflating an abdominal sac, can swell out its body to a globular shape.

GLOBE-RANGERS. A sobriquet for marines.

GLOBULAR SAILING. An antiquated term for *spherical sailing*.

Gloucester. A city and port of entry of Essex Co., Mass. It has a greater amount of tonnage employed in domestic fisheries than any other town in the United States, amounting in 1878 to 32,604 tons, the number of vessels being 520, of which 409 were employed in the fisheries. The quantity of mackerel inspected in 1876 was 95,422 barrels. The number of men employed in the cod- and mackerel-fisheries was 5000. In 1875 the fleet landed 9,710,787 pounds of fish. The cod-fishery has been successfully prosecuted for more than a century. In 1876 the number of vessels owned here and employed in the cod-fishery was 375. The total value of the fisheries in 1876 was $4,000,000. The harbor is one of the best on the coast, and is accessible at all seasons to vessels of the largest class. Pop. 17,000.

Glower. To frown upon; to look savagely.

Glue Cement. One pound glue, one pound black resin, quarter-pound red ochre, mixed with the least possible quantity of water.

Glue, Marine. One part india-rubber, twelve parts mineral naphtha or coal-tar; heat gently, mix, and add twenty parts of powdered shellac. Pour on a slab to cool; when used, to be heated to about 250° F.

Glum. Gloomy; low-spirited.

Glut. A piece of wood used as a fulcrum for a lever. A becket attached to the after part of a square-sail, into which is hooked the bunt-whip. Topsails frequently have three gluts, two abaft for furling and one forward for a midship bunt-line used in taking in the last reef.

Glycerine, Nitro-. See EXPLOSIVES.

Gnomon. The hand; style of a dial.

Go-about. To put a ship on the other tack.

Go Ashores. The seaman's best dress.

Gobarto. A large and ravenous fish of early voyagers, probably a shark.

Gobbag. A name for the dog-fish.

Gob-doo. A term for a mussel.

Goblachan. A name for the parr or samlet.

Gob-line, Gob-rope, or Martingale Back-rope. A rope which fits over the dolphin-striker with a cuckold-neck, the ends setting up to the bows; they are frequently made of chain.

Gobon. An old English name for the whiting.

Gob-stick. A horn or wooden spoon.

Goby. A spiny-finned fish allied to the blenny, and distinguished by having the ventral fins on the breast capable of forming a funnel-shaped sucker. Several species of the genus *Gobius* are so called. They are mostly small sea-fishes, and can live for some time out of the water.

Godon, Sylvanus W., Rear-Admiral U.S.N. Born in Pennsylvania. Appointed midshipman from the same State, March 1, 1819.

Commissioned as lieutenant, December 17, 1836; attached to sloop-of-war "Peacock," East India Squadron, 1836–37; and to sloop-of-war "Cyane," Mediterranean Squadron, 1840; attached to bomb-brig "Vesuvius," 1847, at the siege of Vera Cruz; on special duty, 1850; executive-officer of steamer "Susquehanna," East India Squadron, 1851–53.

Promoted to commander, September 14, 1855; commanding sloop-of-war "Mohican," Pacific Squadron, 1860.

Commissioned as captain in 1861, and ordered to command of sloop-of-war "Powhatan," one of the vessels of Dupont's Expedition to Port Royal.

Promoted to commodore, January 2, 1863; on special duty, 1864; commanding steamer "Susquehanna," and Fourth Division of Porter's Squadron, at the two battles of Fort Fisher, in December, 1864, and January, 1865.

Commissioned as rear-admiral, July 25, 1866; commanding South Atlantic Squadron, coast of

Brazil, 1866–67; commandant navy-yard, New York, 1868–70. Retired in 1871, and died May 17, 1879.

Godown. The name given to store-houses and magazines in the East Indies,—a corruption of the Malay gâdong.

Godsend. An unexpected relief or prize; wreckers denote by the term vessels and goods driven on shore.

Goe. A creek smaller than a voe.

Gogar. A serrated worm used for fishing-bait.

Goglet. An earthen vase or bottle for holding water.

Goillear. The Gaelic for a sea-bird of the Hebrides, said to come ashore only in January.

Going Free. Sailing with a wind which allows the yards to be braced in and sheets eased off.

Going Large. Sailing with a wind which permits the stun'sails to be set.

Going through the Fleet. An old method of punishment, long since abolished. The victim was sentenced to receive a certain portion of the flogging alongside the various ships.

Goldeney. A name for the yellow gurnard.

Golden Fleece. Jason, the Argonaut, sailed with his companions from Iolchos to Colchis to avenge the death of his kinsman Phryxus, and to recover his treasures, which the perfidious Æëtes, king of Colchis, had seized, after murdering their owner. The ship in which Phryxus had sailed to Colchis was adorned with the figure of a ram on the poop, which gave occasion to the poets to pretend that the journey of Jason was for the recovery of the golden fleece, 1263 B.C.

Golden Number. The cycle of 19 years, or number which shows the years of the moon's cycle; its invention is ascribed to Meton, of Athens, about 432 B.C. To find the golden number or year of the lunar cycle, add one to the date and divide by nineteen, then the quotient is the number of cycles since Christ, and the remainder is the golden number.

Gold-fish. A small fish of the genus *Cyprinus* (*C. auratus*), so named from its color being like that of gold. It is a native of China, and is said to have been introduced into Europe in 1691. It is often kept in small ponds or glass globes, as an object of curiosity or ornament.

Gold Mohur. A coin in the East Indies varying a little in each presidency, but averaging 15 rupees, or about 8 dollars of our money.

Goldsborough, Charles W., the first chief of the Bureau of Provisions and Clothing, was born at Cambridge, Md., April 18, 1779; died at Washington, December 14, 1843. He was chief clerk of the Navy Department under Stoddart, Smith, and Hamilton, and was secretary of the Navy Board until separate bureaus were established. Author of "U. S. Naval Chronicle" (1824).

Goldsborough, John R., Commodore U.S.N. Born July 2, 1809, in Washington, D. C. Appointed midshipman from District of Columbia, November 6, 1824; previous to which was a cadet-midshipman on board the flag-ship "John Adams," bearing the broad pennant of Commodore David Porter, West India Squadron; attached to the ship-of-the-line "North Carolina," and sloop "Warren," Mediterranean Squadron, from November, 1824, until June, 1830; on board of the "Warren" was engaged in several important operations against the Greek pirates; bombarded the town of Miconi, and at one time, when in command of the launch of the "Warren" with 18 men, engaged, and after a short and spirited engagement, captured the Greek armed piratical schooner "Helene," of 4 guns and 58 men; received the thanks of Capt. Kearney, for the handsome manner in which this service was performed.

Promoted to passed midshipman, April 28, 1832.

Commissioned as lieutenant, September 6, 1837.

Commissioned as commander, September 14, 1855; commanding naval rendezvous, Philadelphia, 1855–59; waiting orders, 1860; commanding steamer "Union," blockading off Charleston, Savannah, and Cape Hatteras, and in Potomac Flotilla, 1861; captured and sank the rebel piratical schooner "York," and bombarded a rebel fort off Mathias Point, Potomac River.

Commissioned as captain, July 16, 1862; commanding steamer "Florida," South Atlantic Blockading Squadron, 1862; at the capture of the city and forts around Fernandina; commanding steam-frigate "Colorado," Western Gulf Blockading Squadron, 1863.

Commissioned as commodore, April 13, 1867. Retired July 2, 1870; died June 22, 1877.

Goldsborough, Louis Malesherbes, Rear-Admiral U.S.N., was born in Washington, D. C., February 18, 1805, and in December, 1812, when less than 8 years of age, an antedated midshipman's warrant was given to him. In July, 1816, he was given his first orders into service, which were to join the "Independence," 74, under Commodore Bainbridge, at Boston.

In 1817 he was ordered to join the "Franklin," 74, destined for the Mediterranean, as the flag-ship of Commodore Stewart; and at the end of this ship's cruise, and while she was at Gibraltar on her way home, he was transferred to the frigate "Guerriere," in which ship he returned to the United States late in the year of 1820.

In 1821 he was again ordered to join the "Franklin," once more the flag-ship of Commodore Stewart, but now bound to the Pacific; and he remained on board of her throughout the cruise.

In 1825 he obtained permission from the Department to avail himself of the schools of Paris, at his own expense, with the view of prosecuting his studies in the French language and in the scientific branches of his profession,—mathematics, astronomy, etc.

In 1827, having received orders from the Department, he joined the Mediterranean Squadron, then commanded by Commodore Rodgers; and after remaining for a while on board the "North Carolina," 74, he was ordered to join the schooner "Porpoise," under command of Lieut.-Commandant Benjamin Cooper. At this period, piratical depredations, in and about the Grecian Archipelago, were of frequent occurrence, so that no merchant vessel, unprotected by a vessel of war, could with safety venture eastward of the island of Malta. In this state of things, the "Porpoise" was kept actively employed in affording convoy from and to Malta and Smyrna. Vessels of war of other nations were also en-

gaged in performing the same service, and a general understanding existed that each would give protection to any merchantman that might ask it, regardless of nationality, as the whole civilized world pronounced pirates enemies of the human race.

In September, 1827, the "Porpoise" left Smyrna for Malta, with a convoy under her charge, consisting of 11 merchant vessels, 5 of which were American; and while becalmed in the Doro passage at night, one of the convoy, an English vessel called the "Comet," was attacked and carried by some 200 or 300 Greek pirates, who had put out from the islands of Andros and Negropont for the purpose, in 5 very large *mysticoes*, or boats, each arranged to pull some 40 or 50 oars. The "Comet," owing to the calm, was at some distance from the "Porpoise" and the rest of the vessels of the convoy perhaps a couple of miles, but in the midst of the noise and confusion on her deck, her mate and another of the crew succeeded in effecting their escape in the stern-boat, reaching the "Porpoise," and imparting all they knew. Although the firing of arms by the pirates as they approached the "Comet" had attracted anxious attention on board the "Porpoise," and put all on the *qui vive*, yet up to the moment of the arrival alongside of the mate, nothing had been distinctly ascertained, although efforts with the sweeps were being made to approach the "Comet." It was soon found, however, that the mysticoes were towing the "Comet" faster away from the "Porpoise" than the latter vessel could be moved by the agency of sweeps, and as the only remaining alternative to recover the "Comet" the boats of the "Porpoise" were now resorted to. They were promptly prepared to assail the pirates, and all of them were placed under Goldsborough's command. All told, they were manned by some 40 officers and men, nor could they possibly accommodate more. The pirates numbered at least 200. Despite, however, of this disparity, the "Comet" was boarded without hesitation, the pirates driven from her deck, and the vessel was thus fully recovered. In the struggle, from 80 to 90 of the pirates were either killed or wounded.

The wardroom steward of the "Porpoise," a mulatto of herculean strength, was one of the expedition, and killed with his own hand no less than 11 of the pirates; while the chief of the horde, with several of his men, was dispatched by the pistol of Lieut. John A. Carr, of Virginia. These pirates were at this time so numerous that no merchant vessel, unprotected by convoy, could venture to thread its course among the islands of the Greek Archipelago with impunity; and so powerful were they, that at one time they succeeded in capturing an Austrian 10-gun man-of-war brig. Our merchant marine suffered heavily by their depredations, for they attacked indiscriminately vessels of every nation except their own. In such a state of affairs, a sound thrashing, like that administered by Lieut. Goldsborough and his little company, could hardly fail of good effect.

In 1830, Goldsborough returned to the United States in the "Delaware," 74, Commodore Crane, as one of her lieutenants, and shortly afterward he brought to the notice of the Department the defectiveness of the implements of navigation—charts, chronometers, sextants, quadrants, etc.—generally furnished to our ships by the process of requisitions upon navy agents, and urged as a remedy the establishment of a depot of charts and instruments, in order that every article might be thoroughly examined and tested before it was issued for use. The suggestion was strongly supported by the Navy Commissioners, and in a little while the depot was under way, with Goldsborough in charge of it. This was the nucleus of the present observatory.

In 1846, war existing with Mexico, he applied to be employed, and was appointed executive-officer of the "Ohio," 74, commanded by Capt. Stringham, and was present on board that ship at the fall of Vera Cruz, and subsequently commanded a large detachment of her officers and crew at the attack and capture of Tuspan.

In 1849 he was ordered by the Department as the senior naval officer of a joint commission, composed of three army and three navy officers, to explore California and Oregon, with the view of ascertaining and reporting upon the advantages they might possess for military and naval purposes, the proper situations for fortifications, dock-yards, light-houses, etc. In 1851 he returned from this service to Washington, and in 1852 he was ordered to command the frigate "Cumberland," and the flag-ship of Commodore Stringham, destined for the Mediterranean. After serving on board of her, in command, for some time, the commander of the "Levant," one of the vessels of the squadron, died, and he (Goldsborough) was ordered to command that vessel; and while on board of her at Constantinople, he received orders to return to the United States to take command of the Naval Academy, and accordingly did so return in October, 1853, and in the following month, November, took command of that establishment, and continued as its superintendent until September, 1857, or nearly four years. In the fall of 1857, he was detailed as one of the Board of Revision in cases which had arisen under the first law of Congress touching officers to be placed on a retired or a reserved list, and subsequently, as the head of a board to revise and rewrite the Book of Ordnance Instructions.

In 1859 he was ordered to command the frigate "Congress," fitting at Philadelphia as the flag-ship of Flag-Officer Joshua R. Sands, appointed commander-in-chief of the Brazil Squadron; and he returned to Boston as the captain of that ship in August, 1861, shortly after the first battle of the Rebellion at Bull Run, when Flag-Officer Sands, having performed his cruise to the entire satisfaction of the government, was, as a matter incident to the non-return of the ship to Brazil, relieved from his position. She, however, was still continued in commission, and in September, or shortly after reaching home, Goldsborough was ordered to proceed with her, under his command, to Hampton Roads, and there report to Flag-Officer Stringham.

On arriving at Hampton Roads, orders from the Department were placed in his hands, by Flag-Officer Stringham, directing him to take command of the North Atlantic Squadron, and thus to relieve Flag-Officer Stringham, who, it was understood, did not desire to be continued in command of it, and had so expressed himself to the Department.

He retained the command of the North Atlantic

Squadron during 1861–62, being promoted to rear-admiral July 16, 1862, and performed his important duties at that most critical period of the war to the entire satisfaction of the Department. In 1863, he was assigned to the very important duty of preparing a code of regulations for the naval service. On completing this work to the full extent he was authorized to proceed, he was then assigned to revise the book of naval allowances in regard to equipment and outfits.

In April, 1865, he was appointed to command the European Squadron, and after serving out his full time in this command, he was relieved from it by the appointment of Admiral Farragut to take the position, and therefore returned to the United States in his flag-ship "Colorado" in August, 1867. Special duty in Washington, 1867 to the date of his death, February 20, 1877.

Gold-sinny. A small fish, the *Crenilabrus Norwegicus.*

Gomer. A form of chamber in ordnance consisting in a conical narrowing of the bore towards its inner end. It was first devised for the service of mortars, and named after its inventor, Gomer. See CHAMBER.

Gomeisa. The name of the star β *Canis Minoris.*

Gomere (*Fr.*). The cable of a galley.

Gondola. A light pleasure-barge used on the canals of Venice, generally propelled by one man standing at the stern with one powerful oar, though the largest kind have two or more rowers. The medium-sized gondolas are about 30 feet long and 4 feet broad, with a well-furnished cabin amidships, though exclusively black, as restricted by law. They rise at each end to a very sharp point about the height of a man's breast. The stem is always surmounted by the ferro, a bright iron beak or cleaver of one uniform shape, seemingly derived from the ancient Romans, being the *rostrique tridentibus* of Virgil. Also, a passage-boat of 6 or 8 oars, used on other parts of the coast of Italy. The name is also applied to canal-boats having the bow and stern alike.

GONDOLIER. A man who works or navigates a gondola.

Gone. Carried away; parted; broken.

Gone-goose. A ship deserted or given up in despair.

Gong. A kind of Chinese cymbal, with a powerful and sonorous tone produced by the vibrations of its metal, consisting mainly of copper and tutenag or zinc; it is used as a signal for calling away the riflemen; in vessels without field-music it is used to summon the crew to quarters.

Gonga. A general name for a river in India, whence comes Ganges.

Good-at-all-points. Practical in every particular.

Good-conduct Badge. See BADGE.

Good Shoaling. An approach to the shore by very gradual soundings.

Goole. An old term for a breach in a sea-bank.

Goosander. The *Mergus merganser*, a sea-fowl, allied to the duck, with a straight, narrow, and serrated bill, hooked at the point.

Goose-neck. A sort of iron hook fitted on the inner end of a boom, and introduced into a clamp of iron or eye-bolt, so that it may be unhooked at pleasure.

Goose-wing. The clew of a course or topsail when the middle part is hauled up and lashed to the yard; this is done in very bad weather only. The term is also applied to the sails of a schooner running before the wind with the sails wing-and-wing.

Gorab. See GRAB.

Goramy. A fish of the family *Anabasidæ*, a native of China and the Eastern Archipelago. It is one of the nest-building fishes, and at the breeding season forms its nest by entangling the stems and leaves of aquatic grasses.

Gord. An archaism denoting a deep hole in a river.

Gore. A triangular piece of cloth or canvas set in to enlarge a garment or sail at a particular point. To cut in the form of a gore.

GORING-CLOTHS. That part of a sail cut on the bias to give the required sweep.

Gorge. The groove in a sheave.

Gorgon Steam-engine. A form of direct-acting vertical cylinder steam-engine, invented by Seaward, as a means of obviating the use of the beam in marine engines. It is called the "Gorgon" engine from having been first employed in an English government steamer of that name.

Gormaw. A name for the cormorant.

Gorse. Heath or furze for breaming a ship's bottom.

Gosnold, Bartholomew. Near the close of the reign of Queen Elizabeth this navigator crossed the Atlantic, and in seven weeks reached the bay of Massachusetts. Turning to the south he discovered a promontory, to which he gave the name of Cape Cod from the abundance of cod-fish found there. Gosnold then proceeded to take possession of other islands, to which he gave the names of "Martha's Vineyard" and "Elizabeth."

Gosport. A fortified seaport town of England, separated from Portsmouth by the mouth of Portsmouth harbor. Pop. 7500, mostly engaged in the government navy-works, and in the supply of shipping. Gosport has extensive barracks, the Royal Clarence victualing-yard, a powder-magazine and iron-foundries. Outside of the town on the south is Haslar Hospital, a naval infirmary.

Gossoon. A silly, awkward lout.

Gothenburg. A seaport city of Sweden, at the head of a fiord of the Cattegat, which receives the Götha River. The harbor, defended by three forts, has 20 feet of water, and a grand dry-dock cut in solid rock. Pop. 69,000.

Gouge. An unwarrantable proceeding which inures to the injury of another; a cheat. A reprehensible practice, sometimes indulged in at the Naval Academy, of using concealed bits of paper, etc., as aids to the memory in making a recitation; also, the article so used. Gouging is equivalent to *ponying* or *papering.*

Gougings. Gudgeons.

Goulet. Any narrow entrance to a creek or harbor; as, the goletta at Tunis.

Gouries. The garbage of salmon.

Government, Naval, may be defined as that system of fundamental rules by which a navy is governed. The chief desideratum is that the rules shall be so framed as to insure an energetic, efficient, and economical management of the affairs of a navy. These rules may have either

the sanction of custom or the authority of law. In either event they partake of the character of the government under which they are framed. In England, for example, the supreme power is divided into two branches: the Parliament, consisting of the Crown, Lords, and Commons; and the Executive, consisting of the sovereign alone. Thus the executive forms a co-ordinate part of the legislative branch. It is not surprising then to find that the privy councillors, or members of the cabinet, have seats in one or the other of the two houses of Parliament. The First Lord of the Admiralty has the opportunity, therefore, as a member of Parliament, of presenting the navy estimates himself, and, at the same time, of explaining the naval policy of the administration, and of answering such questions and meeting such objections as may be offered. Besides the First Lord there is a civil lord, who also is a member of Parliament, and a Parliamentary or Financial Secretary. This intimate relationship between the executive and the legislative branches of the government goes far towards insuring harmony of action between the two, and greatly facilitates the transaction of public business. The five lords and the Parliamentary Secretary change with the ministry, so that not only the government but the Navy Department is always in accord with Parliament. The average duration of a ministry, taking the last 150 years, is about three years and eight months. These changes affect the navy at large but little, however, as the greater part of the work of the Admiralty is distributed among heads of departments (in a manner somewhat analogous to the distribution of duties among the chiefs of bureaus of the United States Navy Department), who are quite independent of party politics.

While the First Lord is directly responsible to Parliament and controls the navy as a whole, the Senior Sea Lord, under his authority, directs the movements of the fleet, and is responsible to him for its discipline. He is commander-in-chief, as it were, of all the floating force; or, in military phrase, the adjutant-general to the First Lord, relieving him of those purely professional duties which the civilian frequently finds so difficult to master. The proof of the efficiency of this form of naval government may be found in the fact of its having stood the test, during nearly two centuries, of great wars, wherein the naval resources of the country have been strained to their utmost, and of its having successfully resisted a formidable combination, in 1861, to abolish it.

To the foregoing the naval administration of the United States presents some points of strong contrast.

By the act of September 2, 1789, establishing a Treasury Department, the Congress of the United States provided that the Secretary of that Department might be "required to give information to either branch of the legislature *in person* or in writing . . . respecting all matters pertaining to his office." This is the only instance, it is believed, under the laws of the United States, where a member of the executive branch of the government could be permitted, in the prosecution of public business, to raise his voice in the legislative halls; but so foreign is such a proceeding to the genius of the Constitution, that the provision relating to personal explanations has become a dead letter. This complete separation between the executive and legislative branches leaves a hiatus between the two which, however desirable in theory, tends but little to accelerate the dispatch of public business, and renders a definite line of naval policy practically impossible.

In the organization of the Navy Department of the United States there is a Secretary of the Navy appointed from civil life. The law permits him to distribute the duties of the Department among eight bureaus, very much as it is in the fixed administration of the English navy; but it provides him with no professional assistant to occupy towards him the relative position the Senior Sea Lord bears towards the First Lord of the Admiralty; consequently much of the duty pertaining to that very important office is imperfectly performed, or not performed at all,—there is no one to whom it legitimately belongs.

The proof of the inefficiency of this form of naval government is to be found in the fact that it utterly failed to stand the test of war. The foregoing will serve to illustrate the principle of naval administration. For further information, see ADMINISTRATION and ADMIRALTY.—*S. B. Luce, Captain U.S.N.*

Governor. A machine for regulating the speed of a prime mover, such as a steam-engine, water-wheel, or windmill, by automatically controlling the quantity of steam admitted to a steam-cylinder, or the supply of water to a wheel, or by feathering or reefing the sails of a windmill. There is a great variety of types and devices in use, but the original invention is attributed to Watt. Among these is the type of "ball-governor," or revolving pendulum, which consists of two suspended balls, the centrifugal force of which widens their amplitude as the speed is increased, and gravity or the force of springs diminishes it as the speed decreases; the motion due to the varying position of the planes in which the balls revolve being communicated to the throttle, sluice-valve, or other mechanism, by means of a sleeve on the spindle or a rod within it, and requisite rods and levers. Other devices consist, in principle, of obliquely placed blades or vanes revolving in a liquid or in the atmosphere, and producing an axial motion with variation of speed; and again, others depend upon the moment of inertia of a heavy wheel, which, by suitable mechanism, either actuates the throttle-valve directly, or by the intervention of a small steam and hydraulic cylinder. In some marine steam-governors the action depends upon the head of water due to the variable immersion of the screw-propeller in a sea-way; and both mechanical and electrical contrivances are used. Marine governors thus far have met with but limited success.

Gow. An old term for the gull.

Gowk. The cuckoo. A stupid, good-natured fellow.

GOWK-STORM. A late vernal equinoctial gale, contemporary with the gowk or cuckoo.

Goylir. A small sea-bird whose appearance is said to precede a storm; hence seamen call them *malifiges*.

Grab. The large coasting-vessel of India, generally with two masts and of 150 to 300 tons burden. It drew but little water, and had a projecting prow covered with a strong deck on a

level with the main deck of the vessel, from which it was separated by a bulkhead that terminated the forecastle. It was armed with guns varying in calibre from 6- to 12-pounders.

Grabble. To endeavor to hook a sunken article. To catch fish by hand in a brook.

Grade. See Rank.

Graft. To cover a ring-bolt, strap of a block, etc., with a weaving of fishing-line or log-line. In early days the strap of a block was frequently *grafted* instead of being spliced; the ends of the strap were joined as for splicing, the strands were opened out and laid up into nettles, and the nettles were grafted over the opposite part.

Grain. In the transverse section of a tree two different grains are seen; that running in a circular manner is termed the *silver* grain; the other radiates from the centre, and is called the *bastard* grain. *Grain* is also a name applied to a whirlwind in Normandy; it is transitory in its nature, and is accompanied by rain. *Bad-grain*, a sea-lawyer; a nuisance. *In the grain of*, in the wake of. A mast is said to have its grain *upset* when it suffers an injury by compression,—frequently due to too much setting up of the rigging.

Grained Powder. See Powder.

Grains. A large fish-spear with several prongs.

Gram. A species of pulse given to horses, sheep, and oxen in the East Indies, and supplied to ships for feeding live-stock.

Grampus (Fr. *grampoise*, a corruption of *grand poisson*). An animal of the cetacean or whale tribe, distinguished by the large pointed teeth with which both jaws are armed, and by the high falcate dorsal fin. It generally attains a length of 20 to 25 feet, and is very active and voracious.

Grampus, Blowing the. Sluicing a person with water, especially practiced on him who skulks or sleeps on his watch.

Grandsire. The name of a four oared boat which belonged to Peter the Great, now carefully preserved at St. Petersburg as the origin of the Russian fleet.

Granny's-bend. The slippery hitch made by a lubber.

Granny-knot. This is a term of derision when a reef-knot is crossed the wrong way, so as to be insecure. It is the natural knot tied by women or landsmen, and derided by seamen because it cannot be untied when it is jammed.

Grape, or Grape-shot. Grape-shot consists of a circular cast-iron stand of the proper dimensions, having an upright spindle in the centre, around which balls are placed and held in position by a stout canvas covering, the lower edge of which is secured to a circular plate by a strong seizing, and quilted over the balls by marline, the upper edge of the canvas being drawn in and secured to the upper part of the spindle. It is then painted as a protection against dampness, the balls and stand being well coated with red lead before being made up. To the top of the spindle a shackle or handle is fixed to facilitate handling.

Grape-shot have not sufficient penetration to be used with effect, generally, against ships-of-war beyond 150 yards. When the men on the spar-decks of the enemy are exposed by the heeling of the ship, grape or canister may be used against them at distances varying from 200 to 300 yards. Against light vessels, a single stand of grape from heavy guns may be used at about 400 yards. The dispersion of the balls is about one-tenth the distance, and is practically independent of the charge.

Grapnel, or Grappling. A pronged implement used as an anchor for a boat; for the purpose of recovering an object at the bottom of a harbor; for hooking on to ropes, etc., likely to foul the screw; for securing one vessel to another when boarding is to be attempted; or to make fast a tow-line to a burning vessel, etc.

Grapnel-rope. The rope bent to a grapnel. It is sometimes fitted with a length of chain for towing ships on fire, in order that it may not be burnt off.

Grapple. To seize; to hook with a grapnel.

Grappling. See Grapnel.

Grasp, Death-. The convulsive clutch of a drowning person. See Drown.

Grass Combers. A galley-term for landsmen who enter the naval service from the rural districts. Many of them make good seamen.

Grate. A floor or platform consisting of bars of iron or other material, separated one from another so as to allow a vacant space between. Used in steam-boiler and other furnaces for supporting the bed of burning fuel while permitting free access of air thereto.

Grate-bar. One of a number of bars composing a furnace-grate.

Gratings. Lattice-work made of ash to cover the hatchways, etc.

Grating-deck. A light movable deck made of gratings.

Grave. To clean a vessel's bottom, and pay it over.

Graving Beach, or Slip. The portion of a dock-yard where ships were placed to be graved.

Graving-dock. See Dock.

Gravel. To vex; to irritate; to mortify.

Gravelin. A small migratory fish supposed to be the spawn of the salmon.

Gravitation (Lat. *gravis*, heavy). A term used to denote that mutual tendency which all the bodies of nature have to approach each other, with forces which are directly as their masses, and inversely proportional to the squares of their distances. This mutual tendency of all the particles of matter to each other is called the *attraction of gravitation*. In reference to any particular body or mass of matter the aggregate attraction of all its particles is usually called simply its *gravity*. *Absolute gravity*, that by which a body descends freely in a vacuum. *Relative gravity*, that by which a body descends when the absolute gravity is opposed by a constant but inferior force, such as in the descent of inclined planes, or in resisting mediums, as air and water. *Specific gravity*, the ratio of the weight of a body to the weight of an equal volume of some other body assumed as a conventional standard. The standard usually adopted for this purpose is pure distilled water at a given temperature. See Centre of Gravity.

Grawls. The young salmon. See Grilse.

Gray-fish, Gray-lord. Names given to the coal-fish, *Gadus carbonarius*.

Grayle. Sand; small gravel.

Grayling. A fish of the salmon kind (*Thymallus vulgaris*), inhabiting many of the streams of England, and also found in Norway and Sweden.

Grayning. A species of dace.

Gray-school. A particular shoal of large salmon in the Solway in July.

Graze. To rub or touch lightly in passing over.

Greasy Weather. Dirty, disagreeable weather.

Great Britain, Navy of. If any reliance could be placed on tradition, the credit of originating a navy for the defense of the coasts of England would be assigned to Alfred the Great. There is no doubt that, at all times subsequently, fleets of small craft were maintained for the national protection, but it does not appear, from authentic records extant, that any large ships were built for warlike purposes until the reign of Henry VII., when a two-decked vessel—the first of the kind—was launched in the year 1488, and received the appellation of the "Great Harry." Still, nothing in the form of a regular royal navy was established until Henry VIII. ascended the throne. Three years after his accession, England was involved in a war with France, and steps were taken to invade that country. A fleet was equipped for the purpose. The French were prepared, and a battle—the first sea-fight in which cannon were employed—took place off Brest on the 10th August, 1512. The action was indecisive, and the fleets returned to their respective harbors. In the following year a similar expedition was sent against Brest. The French resisted it with galleys. Sir Edward Howard, the lord high admiral, was killed in the action. Henry now set to work vigorously in the constitution of a royal navy. A large three-decked man-of-war was constructed, and called the "Henri, Grace de Dieu," which name was afterwards changed to that of the "Edward." Fifty-eight other vessels were built, the tonnage of which ranged from 80 to 1200. For the proper government of the navy, Henry VIII. established an admiralty and a navy office, and Sir Thomas Howard was appointed lord high admiral, in succession to his brother. For close combat, muskets, hackbuts, and matchlocks were introduced in 1514.

The war with France having come to a close, we read of no more sea-fights until 1523, when the treaty was broken, and an English fleet attacked and took possession of Boulogne. Continual actions were fought without striking results, while the French galleys and the English *pinnaces*, then used for the first time, kept up a sort of desultory guerrilla warfare. In the mean time King Henry persevered in his plans, and established dock-yards at Deptford, Woolwich, and Portsmouth. He made laws for the planting and preservation of trees, that timber might always be available for ship-building. Further, he assigned regular pay to the officers and sailors, which contributed to render the service very popular.

Edward VI., who succeeded to the throne on the death of Henry VIII., was a peaceable monarch, and devoted his resources to scientific objects. He engaged the services of Sebastian Cabot, and sanctioned an attempt, under Sir Hugh Willoughby, to open a way to India and China in a northwest direction. Queen Mary, who succeeded Edward, did not follow up his measures for the perfection of naval efficiency, doubtless influenced by her husband, Philip of Spain, who desired to cripple a service that might become formidable to his own country. But Queen Elizabeth, who knew that the only way to protect the shores and commerce of England was to be prepared for war, proceeded soon after her accession to repair the neglects of her predecessor. She continued the construction of men-of-war, fortified the banks of the Medway, in Kent, which was the rendezvous of the ships, encouraged the manufacture of gunpowder, and established arsenals in the chief sea-board cities. The merchants followed the queen's example, and by the time she had occupied the throne for four years as many as 20,000 seamen were available to man the ships of war. The country was at peace, and opportunity was therefore given for a further prosecution of the endeavor to effect discoveries and acquire distant possessions. The annexation of Virginia (America) and other places was the result. But the state of peace was not permanent. A religious war between Protestants and Catholics had been waging for many years, and Elizabeth giving countenance to the Dutch Protestants, afforded Philip of Spain a pretext for sending an "Armada" of 130 fine war-ships and innumerable transports against England. The year 1587 saw the approach of the Armada and its complete destruction, partly by the British vessels, which met isolated Spanish ships and gave them battle, and partly by a furious storm, which dispersed the expedition. This victory and an attack upon Cadiz, Philip's greatest seaport, completed the warlike operations of the navy during the 16th century. The queen was fortunate in her admirals. The names of Howard of Effingham, Francis Drake, Frobisher, and Hawkins adorn the page of England's naval history. Those gallant men were all lost to the nation towards the close of Elizabeth's reign. Frobisher was killed in an attempt to recover Brest from the Spaniards, and Drake and Hawkins died in India.

Not until the middle of the 16th century did anything occur to give active employment to the navy. Meanwhile, a third big ship was built, and armed with 100 guns of divers calibre. At the same time the classification of ships by *rates* and *guns* was begun. In 1652, Oliver Cromwell being then at the head of affairs, war was declared between England and Holland. It arose from the habitual refusal of the Dutch, under Van Tromp, to lower their flag to the British. Gens. Blake, Monk, and Deane were appointed to lead the English squadrons, and they were opposed by Admirals De Ruyter, Van Tromp, and De Witt. On the 3d of June, 1653, the rival fleets met for the first time *in line*. After several fights the Dutch were compelled to retreat to the Texel. The loss on both sides was very heavy, and Holland and England again shook hands. Two years later (1653) Blake was dispatched to the coast of Morocco to punish the African marauders, who had plundered and imprisoned British subjects. He attacked and destroyed the fortifications of Tunis, then proceeded to Algiers and Tripoli and rescued the captive English, exacting compensation from the Moors for the injuries inflicted. In 1657, war having been declared with Spain, Blake was sent to Cadiz, thence to Santa Cruz, to capture sundry Spanish galleons with gold on board. While on this service he died.

Cromwell left the country in peace when he died. His successor, Charles II., maintained amicable relations with foreign powers until 1665, when war was proclaimed with Holland by the government of Charles II. A large fleet, under the nominal command of the king's brother, the Duke of York, met an equally powerful force under Opdam, and in the engagement which took place the evolution called "breaking the line" was first adopted, and proved a success. The Dutch were defeated; but in the following year De Ruyter took the field in command of the Dutch, and a series of actions ensued, in which the Dutch were masters. The peace of Breda was the consequence. In 1667, the Dutch and the French, while the peace was being negotiated, were aggressive in the West Indies. Thither Sir J. Harman sailed with a sufficient force, and routed the enemy off the island of St. Christopher, at the same time destroying many of their ships. This led to a rupture of the treaty. Charles having listened to the suggestions of his ministers in favor of a false economy, had dismantled many of his ships and discharged the crews. De Ruyter, being apprised of the fact, immediately crossed to England with 70 ships. Sir Edward Spragge confronted him at the mouth of the Thames, and endeavored to defend Sheerness, but the inferiority of the force at his command rendered his efforts unavailing. De Ruyter pushed on, and entered the Medway, where some ships were at anchor. These he destroyed with fire-ships, which were thenceforth used by the English in kindred operations. Subsequently, allied with the French under Count d'Estrées, an English squadron commanded by Sir Edward Spragge gave battle to De Ruyter, Von Tromp, and Von Ghirt. The losses were great on both sides. De Ruyter was wounded and Von Ghirt killed.

In 1685, Charles II. died, and having no legitimate offspring, was succeeded by his brother James. The latter endeavored to restore popery throughout the kingdom, and in the prosecution of this religious object he received aid and countenance from the French king, Louis XIV. The Protestants of the realm, however, opposed themselves vigorously to the attempt to reconvert the country to Catholicism, and ultimately King James was obliged, in 1688, to abdicate the throne, giving place to the Prince of Orange, who had married his daughter. Two years later, however, aided by the French and the Irish Catholics, James tried to regain the crown of England. The land forces of both parties came into collision, in 1690, on the banks of the river Boyne, and James's friends succumbed to the resolute valor of his successor, William III. The French, however, under Tourville, gained a triumph over the combined Dutch and English fleet off Beachy Head, which brought Admiral Torrington into great disgrace. Undismayed by the failure of the Catholic forces on the Boyne water, the king of France equipped an immense naval and military force to invade England and restore James. To check this invasion Admiral Russell sailed with a fleet of 60 ships, carrying 4504 guns and 27,725 men, to which armament 36 Dutch ships were added. The opposing forces met off Cape La Hogue in the month of May, 1692. The contest which ensued lasted four days, and terminated with the destruction of the French fleet. Great joy was manifested by the English people when the news of the victory was proclaimed; and in the absence of King William, his queen (Mary) founded a royal naval hospital at Greenwich, near London, as a memorial of the gratitude of the nation for the blessing vouchsafed it by the Almighty.

After the victory at Cape La Hogue the navy ceased for a time to be formidable. It is on record that no fewer than 50 ships were captured by foreign foes down to 1697. King William, however, rapidly repaired the loss, for it appears that before his death he had built 30 large ships, and incorporated into the navy 15 that had been taken from the French. Queen Anne, his successor, continued the improvement of the national sea force to such an extent that when she died and the elector of Hanover ascended the throne as George I., no fewer than 178 ships of war constituted the navy of England. Of that number, 7 of the highest class or rate carried 100 guns each, the remainder had 20 to 90 pieces of ordnance, according to their size. There were six different classes of ships, ranging from 374 to 1869 tons each. The larger were rated as "line-of-battle ships," the lesser as *frigates*, from the Italian word *frigata*, a term used to designate certain long vessels of one deck only which swarmed in the Mediterranean and were propelled by oars and sails. The chief defect in all this armament lay in the disproportion of guns to tonnage. The scientific officers of the day were mistaken in their computation of the carrying facility of the ships. All the guns were nearly of the same calibre. It ought not to be forgotten that early in the reign of Anne Gibraltar was taken from the Spaniards, and remains a British stronghold to this day.

There was neither scope nor occasion for the employment of the navy in the reign of the first George. His successor, being of a more chivalrous temperament, espoused the cause of the queen of Hungary, whose territory was menaced by France, Saxony, Prussia, and Bavaria. The land force contributed by Great Britain failed in its efforts to sustain the queen. Advantage was taken of this circumstance by France to assert the pretensions of the son of James II. to the throne of England, and for their enforcement a military force under Count Saxe, and 20 ships of the line under the command of the Duke de Roquefeuille, attempted to effect a landing on the shores of Britain. The expedition was driven back by Sir John Norris and a naval squadron. Especially unfortunate with her army in the Netherlands, where she lost the battle of Fontenoy, England countered her ill luck by the successes of the navy. Admirals Rowley and Warren upheld her consequence, and Louisbourg was taken from the French. At a later period France endeavored to recover Cape Breton, and made a descent on the British colonial possessions in America, at the same time commencing operations against those in India. The French fleets were met by Admirals Anson and Warren, defeated and captured, while Commodore Fox, with 6 ships of war, made prizes of 40 merchantmen bound for St. Domingo. These successes were crowned by Lord Hawke's capture of 7 ships of the line and several frigates off Brest.

The failure of his naval commanders made Louis XIV. desirous of peace. Great Britain,

nothing loth, accepted the proffered terms, and a suspension of arms took place in 1798. But, not long afterwards, the French endeavored to dispossess the settlers in Nova Scotia of their acquired property, and the dormant warfare was renewed (1756), and continued in America for several years. As before, the land operations of the English were not triumphant, while at sea, as usual, they maintained their reputation. One blot, however, temporarily shocked the national sense. The French made an attempt upon the island of Minorca, then held by the English. Admiral Byng, with a squadron, was deputed to raise the siege. He failed in this, and did not even manage to increase the strength of the beleaguered garrison or replenish its stores. For his neglect and asserted pusillanimity Byng was tried by court-martial and shot. Ultimately the French were expelled from Canada. They made an attempt to recover Quebec, and were frustrated by Lord Colville and a squadron of ships of war. About the same time Commodore More and a small military force took Guadaloupe.

On the accession of George III. (1760), certain propositions were made by France in relation to Spain, which Mr. Pitt, the prime minister, construed into an offense to the dignity of England. War with Spain was the issue of the negotiations. France and Spain, united, then made war on Portugal, and directed their hostile measures to Oporto and Lisbon, two ports of great importance to the military and commercial interests of England. The Portuguese and British land forces, however, defeated the project, and the latter, in retaliation, took possession of several of the French West India Islands, and of the city of Havana, in Cuba. About the same time the "Active" and "Favorite," British men-of-war, captured the Spanish register ship the "Hermione," with prize worth three million sterling on board. In the same year (1762) Manilla was wrested from Spain, and the frigates "Argo" and "Rantler" seized a galleon with a million and a half of treasure on board. A truce followed upon these affairs in 1763, and lasted until A.D. 1770, when a temporary misunderstanding occurred between a Spanish and English man-of-war at Port Egmont, on the Falkland Islands.

Naval operations of every kind were suspended after that affair until 1776, when the North American colonies declared their independence of Great Britain. The French people taking part with the revolted States, British ships of war were sent to capture certain islands in the West Indies. Admiral Byron, in command of the fleet, was opposed by Count d'Estaing, who proved too powerful for the English. On the other hand, Admirals Hyde Parker and Rowley repaired the English failures by disturbing French commerce with the islands. Still, it was very apparent to the British Parliament that the navy had deteriorated and required reform and strength. Vigorous efforts were accordingly decreed, and in 1778, Admiral Keppel, assisted by Sir R. Haviland and Sir Hugh Palliser, cruised in the Channel to protect the trade of the country, while Admiral Byron proceeded to America. After two or three isolated combats between the "Arethusa" and "La Belle Poule," the "America" and the "Licorne," which caused the British vessels to approach closely to the French coast, it was discovered (off Brest) that the French were in great force. A fight ensued, lasting three or four days, and the French getting away in safety, serious disputes arose between the admirals, Palliser bringing charges against Keppel which led to his being tried by court-martial. Keppel was honorably acquitted, but the Admiralty Board continuing to discountenance him, Lord Howe and two other admirals resigned, and 20 captains declared their readiness to do the same, but were deterred by the possibility of their services being required. Spain and France were again in alliance. About this time, carronades (so called from the locality of the foundry on the banks of the river Carron, in Scotland) were introduced into the navy, the better to adapt the weight of the metal to the tonnage of the shipping. They proved effective in two actions,—in one of which the "Hébé" was captured and used as a model for English frigates. The number of ships in the service at this date was 300 of all classes, and with this force, available for active service, Admirals Rodney and Hyde Parker made vigorous war upon the allies, gaining many advantages in the West Indies and on the coasts of Spain and Portugal. The Spaniards used great efforts to recover Gibraltar, but Rodney kept the garrison so well supplied that their exertions proved perfectly futile. A new enemy now arose to tax British strength. The States-General of Holland declared for the Americans, and put the navy to some trouble in 1780. Two years later, England was more fortunate, for Rodney defeated the Count de Grasse in an action of fleets, and took the count a prisoner to England, where he was treated with marked consideration. The fight took place off Dominica, and was a fair test of the relative powers of the rival navies.

From 1780 until 1793 the state of affairs in Europe did not call for much activity on the part of the navy, but after the latter date until 1814, revolutionary France and the Emperor Napoleon compelled it to "rule the waves." With few reverses, it swept the navies of France, Spain, and Holland off the seas. Its principal exploits will be found recorded in the brief biographies of Nelson, Howe, Jervis, Collingwood, Cochrane, Cockburn, etc. The capture or cession of the Cape of Good Hope, Ceylon, Cochin and Malacca, etc., are mainly due to its efforts. It was likewise partially engaged in conflicts with the American navy, but without acquiring a superiority.

No particular change took place in the constitution of the navy for many years after the establishment of peace with France; its employment was limited to an association with the land forces in acquiring influence and position in Burmah, China, New Zealand, etc. But the introduction of steam and the screw as elements in propulsion, and the application of breech-loading cannon to the defense of ships, and their offensive faculty, compelled the adoption of a system of armor-plating and the construction of iron vessels of prodigious magnitude. Turrets, forming a kind of floating fortresses, and rams for cutting the hull of a hostile ship at close quarters, likewise came rapidly into use after the commencement of the American civil war in 1861, in which, however, England took no part,

and now the sailing-vessel is gradually becoming a thing of the past. The last operations of the British navy which claim a place in its brilliant annals occurred in the Black Sea, in 1855–56, when a war was undertaken, in conjunction with France and Turkey, against the empire of Russia, and again in 1877–78, when a demonstration was made in the same locality to force the acceptance of terms of peace on the part of Russia again assailing Turkey in Europe and Asia.

The British navy is necessarily the most powerful, and therefore the most costly, in the world. For the current year, the estimate for the expense of the permanent establishment, the contingencies arising out of its employment, and the continued improvements in nautical architecture and gunnery, reaches nearly $55,000,000. For the protection of so many distant possessions, and of the commerce of the country with all nations, numerous vessels of the highest class are essential, and their equipment corresponds with their bulk and faculty of offense and defense. According to the latest navy lists there are about 400 vessels of all types, and of an aggregate tonnage of 900,000. Of these, 58 are armored vessels carrying rifled guns of great calibre, and protected by armor varying in thickness from 4½ to 24 inches. The number of men employed on board the ships in the navy varies, of course, with the exigencies of the service. Not all the vessels are in "commission" at the same time; but they can be placed on a war footing at very short notice, because there is a reserve force comprehending some thousands of seamen who are continually undergoing drill in the principal harbors. The establishment of officers is permanent, and consists of 3 admirals of the fleet, 16 admirals, 19 vice-admirals, 31 rear-admirals, 173 captains, 208 commanders, 840 lieutenants, 230 sub-lieutenants, 217 midshipmen, 264 naval cadets, 11 staff-captains, 94 staff-commanders, 56 navigating lieutenants and 29 sub-navigating lieutenants, 5 chief inspectors of machinery, 5 inspectors, 180 chief engineers, 355 engineers, 120 assistant engineers, 106 chaplains, 23 naval instructors (who may act at the same time as chaplains), 478 medical officers of different ranks and grades, 225 paymasters and 200 assistants, and 54 secretaries to flag-officers. The naval reserv officers are 400 in number. Serving on board the ships or on shore, as occasion may require, there is in addition to the purely naval establishment a large body of royal marines, a highly effective corps at all times. The marine artillery has 90 officers, and the light infantry 19 colonels, 24 majors, 81 captains, and 135 lieutenants.

The government and direction of the affairs of the British navy are vested in a board denominated the Lords of the Admiralty. The first lord is usually a civilian and a member of the cabinet; two of the others are naval lords, selected from experienced officers capable of estimating the wants and judging of the capability of the force. The patronage is divided among these lords; but this only extends to selections for particular services and the appointment to certain ships. The promotion from rank to rank is regulated by the seniority of the officers; the gradation can only be interrupted by the sentence of a court-martial for acts of indiscipline and the pleasure of the sovereign, who may visit misconduct either by dismissal from the service or by placing an offender at the bottom of the list. All the honors of the Bath, the orders of St. Michael and St. George, the Victoria Cross, the Albert and War medals, are available equally to the navy and the army, and special pensions are conferred for good service in war or peace. Pensions for wounds received in action and to the widows of officers are likewise granted, while the sailors who have served long and commendably are provided for on a similar system, and on a scale commensurate with the position they held in the service.—*J. H. Siddons.*

Great Circle. See CIRCLE.

GREAT-CIRCLE SAILING. In great-circle sailing, the ship keeps on the great circle which passes through the place of departure and the place of destination. This is the shortest distance between the two places, and the ship steers for her port as if it were in sight. As the great circle, except in the cases of a meridian and the equator, does not make a constant angle with the meridians, in order to keep on it, a ship must be continually changing her course. This is practically impossible, and hence what is called *approximate great-circle sailing* is more or less adopted. In approximate great-circle sailing, several points on the arc of the great circle joining the place left and the place sought, are fixed upon, and each of these made in succession by the ship sailing on the rhumb-lines connecting them. The sum of the distances described on these several courses, if the points are not taken too far apart, will not differ much from the shortest distance.

Great Guns. A term for heavy ordnance, excluding mortars and howitzers. *Blowing great guns*, blowing violently.

Great-line Fishing. Fishing carried on over the deeper banks of the ocean. Hand-fishing in over 60 fathoms.

Great Ocean. The Pacific.

Great Shakes. See SHAKE.

Grebe. A genus of birds of the family *Colymbidæ*, with short wings and no tail. On land their motions are awkward, but in the water they are very agile. They are said to take their young under their wings and dive to escape an enemy.

Grecale. A northeast breeze off the coast of Sicily,—Greece bearing N.E.

Greece, Navy of. This small state, protected as it is by the more powerful states of Europe, has had little occasion for a navy since it became a monarchy, nor is it in a condition to support a large armed force. Nevertheless a fleet is maintained for the protection of the commerce of the Morea and the isles, consisting of 16 vessels. Two of the vessels are ironclad, the "Olga" and the "Georgius," besides which there are 1 screw-corvette, 5 yachts, 1 screw-gunboat, and 7 pinnaces and small gunboats. The sailors required for this small armament are obtained by conscription. They are in number 581, with 71 commissioned officers.

Greek Alphabet. The small letters of the Greek alphabet are used to distinguish the different stars of the constellations; thus the star Dubhe is *α Ursæ Majoris*, Rigel is *β Orionis.* The navigator should not, therefore, be ignorant of these characters:—

α Alpha (a).	ν Nu (n).
β Beta (b).	ξ Xi (x).
γ Gamma (g).	ο Omīcron (ŏ).
δ Delta (d).	π Pi (p).
ε Epsīlon (ĕ).	ρ Rho (r).
ζ Zeta (z).	σ Sigma (s).
η Eta (ē).	τ Tau (t).
θ Theta (th).	υ Upsīlon (u).
ι Iōta (i).	φ Phi (ph).
κ Kappa (k).	χ Chi (ch).
λ Lambda (l).	ψ Psi (ps).
μ Mu (m).	ω Omēga (ō).

Greek Fire. An incendiary composition used in early times. The invention of Greek fire is ascribed to Callicinus, in the 7th century, but there seems reason to believe that it came originally from India. The accounts of its effects are so mingled with obvious fable that it is difficult to arrive at any just conclusion as to its power, but the mixture seems to have been highly inflammable, and to have possessed the power of burning under water. The process of making it was kept secret for several centuries, but the knowledge of its composition gradually spread until at the time of the discovery of gunpowder it formed a recognized defensive element in most wars from Western Europe to Asia Minor. See FIRE-SHIPS.

Green. Raw; untutored; ignorant; inexperienced.

GREEN-HAND. Embarked for the first time, and consequently inexperienced.

GREEN-HORN. A lubberly, uninitiated fellow. A novice of marked gullibility.

GREEN-MEN (*Eng.*). The five supernumerary seamen who had not been before in the Arctic Seas, whom vessels in the whale-fishery were obliged to bear, to get the tonnage bounty.

Green, Charles, Commodore U.S.N. Born in Connecticut. Appointed from Connecticut, May 1, 1826; receiving-ship "Independence," Boston, 1826; sloop "Erie," West India Squadron, 1827–28; sloop "Peacock," West Indies, 1829–31.

Promoted to passed midshipman, April 28, 1832; New York Station, 1831–34; frigate "Brandywine," Pacific Squadron, 1834–37.

Commissioned as lieutenant, March 8, 1837; sloop "Levant," West Indies, 1838; receiving-ship at New York, 1839–40; sloop "Falmouth," Home Squadron, 1841–43; steamer "Union," Norfolk, 1847; steamer "Michigan," lakes, 1848–50; steamer "Fulton," 1852; receiving-ship "Ohio," Boston, 1853–55.

Commissioned as commander, September 14, 1855; New York Navy-Yard, 1857–58; light-house inspector, Buffalo, 1858–61.

Commissioned as captain, July 16, 1862; commanding "Jamestown," 1861–62; on blockade off Savannah, Fernandina, Wilmington, N. C.; captured and sent into port or destroyed six prizes; sent the boats and destroyed the bark "Alvarado," under guns of fort at Fernandina; commanding receiving-ship "Ohio," Boston, 1863–65; light-house inspector, ninth district, New Orleans, 1865–67.

Commissioned as commodore, March 12, 1867. Retired November 15, 1862.

Green, Joseph F., Rear-Admiral U.S.N. Born in Maine, November 24, 1811. Appointed midshipman, from same State, November 1, 1827; attached to sloop-of-war "Vandalia," Brazil Squadron, 1830; Naval School, Norfolk, 1833.

Promoted to passed midshipman, June 10, 1833; frigate "Potomac," Mediterranean Squadron, 1835–37.

Commissioned as lieutenant, February 28, 1838; sloop "Erie," West India Squadron, 1840; frigate "Columbus," Brazil Squadron, 1843–45; rendezvous, Boston, 1846; ship-of-the-line "Ohio," Pacific Squadron, during all of the Mexican war. Lieut. Green took part in all of the important actions on the Pacific coast. He remained in the "Ohio" until 1850; navy-yard, Boston, 1851–52; ordnance duty, 1853–54; Naval Academy, 1855–58.

Commissioned as commander, September 14, 1855; waiting orders, 1859–60; ordnance duty, 1861.

Commissioned as captain, July 16, 1862; commanding steam-sloop "Canandaigua," South Atlantic Blockading Squadron, 1862–64; participated in the bombardment of Fort Wagner; ordnance duty, Boston Navy-Yard, 1866–68.

Commissioned as commodore, July 24, 1867; special duty, 1869; commanding Southern Squadron of the Atlantic Fleet, 1870–71.

Commissioned as rear-admiral, July 13, 1870. Retired November 25, 1872.

Green-bone. The trivial name of the viviparous blenny, or guffer, the backbone of which is green when boiled.

Greene, Theodore P., Rear-Admiral U.S.N. Born in Montreal, Canada. Appointed midshipman from Vermont, November 1, 1826; in sloops "Warren," "Ontario," and frigate "Constellation," Mediterranean Squadron, 1827–32.

Promoted to passed midshipman, 1832; sloop "Vincennes," Pacific Squadron, and cruise around the world, 1834–36.

Commissioned as lieutenant, December 20, 1837; razee "Independence," Brazil Squadron, master and lieutenant, 1837–39; receiving-ship at Boston, 1841–42; schooner "Porpoise," 1843; store-ship "Lexington," 1844; frigate "Congress," Pacific Squadron, during Mexican war, 1846–48 (six months in command of land forces at Mazatlan); sloop "Cyane," Home Squadron, 1852–53; navy-yard, Boston, 1854–56.

Commissioned as commander, September 14, 1855; light-house inspector, 1858–60; navy-yard, Mare Island, Cal., 1861–62.

Commissioned as captain, July 16, 1862; commanding "St. Iago de Cuba," and "San Jacinto," 1863–64; while commanding latter vessel, left in command of East Gulf Squadron, on return of Rear-Admiral T. Bailey to United States; commanding "Richmond," West Gulf Squadron, 1865 (protected troops landing for attack upon Mobile); ordnance duty, Portsmouth, N. H., 1866; commanding "Powhatan," Pacific Squadron, 1867.

Commissioned as commodore, July 24, 1867; commanding Pensacola Navy-Yard, 1868–70.

Commissioned as rear-admiral, May 24, 1872. Retired November 1, 1871.

Green-fish. Cod, hake, haddock, herring, etc., unsalted.

Greenland Dove. The puffinet; called *scraber* in the Hebrides.

Greenland Whale. See RIGHT WHALE.

Greenock. A seaport town of Scotland, on the S. side of the Firth of Clyde. Lat. 55° 56′

54″ N.; lon. 4° 45′ 15″ W. Greenock has a flourishing mechanics' institute, numerous banks, custom-house, chamber of commerce, seaman's asylum, yards for building iron ships. It has old and new harbors, constructed at great expense, with extensive docks and quays. Pop. 58,000.

Green Sea. A large body of water shipped on a vessel's deck; it derives its name from the green color of a sheet of water between the eye and the light when its mass is too large to be broken up into spray.

Green-slake. The sea-weed otherwise called *lettuce-laver.*

Green Turtle. See TURTLE.

Greenwich, co. of Kent, England, on the right bank of the Thames, 3¾ miles E.S.E. of London Bridge. Lat. of the observatory, 51° 28′ 38″ N.; lon. 0° 0′ 0″. The educational establishments are numerous. Here are royal schools for the children of officers, seamen, and marines. But the principal object of interest in Greenwich is its magnificent naval hospital for the maintenance of veteran, wounded, or unfortunate seamen. It stands on the bank of the river, is 865 feet in length, and covers, with the schools, civil offices, lawns, and burial-grounds attached, a space of 40 acres. A portion of the building is occupied by the Royal Naval College. Pop. of the town, 40,500.

Greep. An old spelling of *gripe.*

Grego. A coarse Levantine jacket with a hood. A cant term for a heavy overcoat.

Gregory, Francis H., Rear-Admiral U.S.N. Born in Norwalk, Conn., October 9, 1789; died at Brooklyn, N. Y., October 4, 1866. He first entered the merchant service; became a midshipman, January 16, 1809; lieutenant, June 28, 1814; commander, April 28, 1828; captain, January 18, 1838; rear-admiral (retired list), July 16, 1862. His first services were near the Balize, where he captured an English brig having 120 slaves on board, also a schooner fitting for piratical purposes; had a night action with a privateer, which he disabled and drove off the coast, and took a Spanish pirate of 14 guns. While serving on Lake Ontario, under Chauncey, in the war of 1812, he was captured in August, 1814; sent to England, and confined 18 months. He next served 3 years in the Mediterranean, under Commodore Shaw, whose daughter he married. From 1821 to 1823 he commanded the "Grampus," in the West Indies. Near St. Croix he captured the notorious pirate-brig "Panchita," a vessel far superior to his own in weight of metal and number of men. He commanded the frigate "Raritan" in the Mexican war. His last sea service was in command of the African Squadron. During the Rebellion he superintended the construction of ironclads.

Grenade. A shell thrown from the hand (see HAND-GRENADE), or placed in baskets or barrels and fired from mortars of large calibre. *Rampart-grenades* are larger than the hand-grenade, and are intended to be rolled down ramparts, etc.

Grenado. An old word for a live shell.

Grenville, Sir Richard, an English vice-admiral, born about 1540. In 1591 attacked a Spanish fleet of more than 50 vessels with a small squadron of 5 vessels. The battle was one of the most obstinate on record, several of the Spanish vessels being sunk. The English were finally obliged to surrender, Grenville soon after dying of his wounds.

Greve. A low, flat, sandy shore.

Grey-friars (*Eng.*). A name given to the oxen of Tuscany, with which the Mediterranean fleet was supplied.

Grey-head. A fish of the haddock kind.

Greyhound. A hammock with very little bedding.

Grey Town. A seaport town of Nicaragua, on the east coast, at the mouth of the navigable river San Juan. It is the principal seaport of Nicaragua. Lat. 10° 55′ N.; lon. 83° 43′ W. The harbor, once the finest on the coast of Central America, is badly silted up. Pop. 1250.

Griban. A small two-masted vessel of Normandy.

Gridiron. A stage or frame made of heavy beams of wood for receiving a ship, in order that her bottom may be examined when the tide falls.

Gridiron-valve. A slide valve containing several ports or openings, working on a corresponding face, used as an expansion or cut-off valve.

Grier, William, Surgeon-General U.S.N. Born in Ireland. Appointed from Maryland, March 7, 1838; entered the service as assistant surgeon; attached to sloop "Cyane," Mediterranean Squadron, 1838–41; store-ship "Erie," Pacific Squadron, 1842–44; schooner "Shark," Pacific Squadron, 1844–46; hospital, New York, 1848; razee "Independence," Mediterranean Squadron, 1849–52.

Commissioned as surgeon, April 14, 1852; fleet-surgeon, North Pacific Surveying Expedition, 1853–56; Naval Academy, 1859; sloop "Macedonian," 1861; receiving-ship, Baltimore, 1862; Naval Hospital, Memphis, Tenn., 1863–65; special duty, Hartford, Conn., 1867; member Board of Examiners, 1868–69; special duty, Baltimore, 1869–71; member of Examining and Retiring Boards, 1871–72; Naval Hospital, Annapolis, 1872; member of Naval Medical Board, 1872; president of Naval Medical Board, 1872–76; chief of Bureau of Medicine and Surgery (surgeon-general), 1877–78; retired, 1878.

Griffin, or Griff. A name given to Europeans during their first year in the East; it has become a general term for an inexperienced youngster.

Grig. A small eel.

Grilse. Generally considered to be a young salmon after its first sojourn at sea, though by some considered to be a distinct fish.

Grind. A half kink in a rope.

Grip. The handle of a sword or pistol. To grasp with the hand; to hold; to bite; as, the anchor *grips.*

Gripe. A piece bolted to the foreside of the stem to complete it below the cut-water. A vessel gripes when she tends to come up to the wind against the helm when sailing close-hauled. This tendency may be remedied by trimming the vessel by the stern.

Gripes. Broad bands formed by strands woven together and fitted with thimbles and laniards; used for securing boats when hoisted. *Griped-to,* the situation of a boat when secured with gripes.

Grit. Spunk; nerve. Rough, hard particles.

Gritt. A kind of sea-crab.

Groats (*Eng.*). A monthly allowance for each man, formerly assigned to the chaplain for pay.

Grobman. A term for a sea-bream about two-thirds grown.

Grodan. A peculiar boat of the Orcades.

Grog. Diluted spirits formerly issued to the navy. In 1740 Admiral Vernon introduced it into the British navy, and it was said to have been named from his grogram coat. Pindar, however, alludes to the Cyclops diluting their beverage with ten waters. The spirit-ration was abolished in our navy September 1, 1862. See RATION.

GROG-BLOSSOM. A red confluence on the face of an excessive drinker.

GROGGY. Stupefied by drink.

Grog-grog. The soft cry of the solan goose.

Grogram. A coarse stuff of which boat-cloaks, heavy coats, etc., were made. See GROG.

Gromal. An old word for *gromet* (which see).

Gromet. A boy of the crew of the ships formerly furnished by the Cinque Ports. His duty was to keep ship in harbor.

Grommet, or Grummet. A ring formed of a single strand of rope, laid in three times round.

GROMMET-WAD. See WAD.

Groove. The channel between the lands in rifled guns.

Gropers (*Eng.*). Ships stationed in the Channel and North Sea.

Grosetta. A minute coin of Ragusa, somewhat less than a farthing.

Ground. To take the bottom or shore; to be run aground through ignorance, violence, or accident. The surface of the earth. *To strike ground*, to obtain soundings. *To break ground*, to heave the anchor clear of the bottom.

GROUNDAGE. A local duty charged on vessels coming to anchor in a port or standing in a roadstead, as *anchorage.*

GROUND-BAIT, or GROUNDLING. A loach or loche.

GROUND-GUDGEON. A little fish, the *Cobitis barbatula.*

GROUND-SEA. The West Indian name for the swell called *rollers*, or in Jamaica the *north sea.* It occurs in a calm, and with no other indication of a previous gale. The sea rises in huge billows, dashes against the shore with roarings resembling thunder, probably due to the "northers," which rage off the capes of Virginia, round to the Gulf of Mexico, and drive off the sea from America, affecting the Bahama Banks, but not reaching to Jamaica or Cuba. The rollers set in terrifically in the Gulf of California, causing vessels to founder or strike in 7 fathoms, and devastating the coast-line. See ROLLER.

GROUND-STRAKE. A name sometimes used for *garboard strake.*

GROUND-SWELL. A swell which rises along the shore, often in fine weather and when the sea beyond is smooth.

GROUND-TACKLE. A general name for all anchors, and for the ropes, chains, purchases, etc., belonging to the anchors.

GROUND-TIER. The lowest tier of anything.

GROUND-TIMBERS. In making up the frame of a wooden ship, the timbers of the lower course are called *ground-timbers.*

GROUND-WAYS. The large pieces of timber laid across the slip or dock to place the blocks on.

Groundling. A fish that keeps at the bottom of the water; the spined loach (*Lobitis trenia*).

Group. Objects arranged in a cluster, in contradistinction to those arranged in a series.

Grouper. A variety of the snapper much used for food in the West Indies.

Grout-head. A certain kind of fish, the groutnol.

Grow. A word used in connection with the chain to indicate the direction of the anchor; as, the chain *grows* on the starboard bow.

Growl. To grumble; to complain.

Grub. Provisions in general. *Fresh grub*, fresh provisions.

GRUB-TRAP. A vulgarism for the mouth.

Gruff-goods. An Indian return-cargo consisting of raw materials; as, cotton, rice, sugar, pepper, etc.

Grumbler. The gurnard, a fish of the blenny kind, which makes a rumbling noise on reaching the surface of the water.

Grummet. See GROMMET.

Grunter. A name of the Pogonias of Cuvier, a fish also called *banded drum* and *young sheep-skin*, so called from the peculiar grunting sounds made by it.

Grus (*Lat.* "The Crane"). A constellation to the south of Piscis Australis; the only bright star in it bears southwest from Fomalhaut.

Gryphon. An old term word for *typhoon.*

Guano. The excrement of sea-birds, a valuable manure found in thick beds in all tropical climates. The transport of it occupies a number of vessels, called *guaneros.* It is of a dingy yellow color, and offensive ammoniacal effluvium. Capt. Shelvocke mentions it in 1720, having taken a small bark laden with it.

Guara. The singular and ingenious rudder by which the rafts or balsas of Peru are enabled to work to windward. It consists of long boards between the beams, which are raised or sunk according to the required evolution,—a device not unlike sliding-keels or centre-boards.

Guard. The body of marines attached to a vessel or naval station.

Guarda-costas. Spanish vessels of war of various sizes, which cruise against smugglers.

Guard-boat. A boat appointed to row the rounds among the ships of war in a harbor. A picket-boat. Also, a boat employed to enforce the quarantine regulations.

Guard-fish. A corruption of the word *gar-fish.*

Guard-irons. Curved bars of iron placed over the ornaments of a ship, or over life-buoys, to defend them from damage.

Guardo. A receiving-ship; a vessel on which men are kept in readiness for sea-service.

GUARDO-MOVE. A trick upon a landsman.

Guard-pile. A pile of the nature of a fender, in front of a wharf, to protect the structure from violent shocks.

Guards. The widening of the deck of a vessel forward and abaft the paddle-wheels.

Guard-ship. A vessel of war appointed to superintend, for the time being, the marine affairs in a harbor. Each ship in the harbor takes this duty for 24 hours, being relieved at colors in the morning. The vessel on duty hoists the guard-flag at the fore.

Gubber. Black mud. One who gathers drift-wood, etc., along a beach.

Gudgeon. The *Gobio fluviatilis*, a river-fish 6 or 7 inches in length. One of the metal braces bolted upon the stern-post, in the eye of which a pintle works.

Guebres. Fire-worshipers.

Guernsey. See Jersey.

Guess-warp. A hawser carried to a distant object and made fast, in order to warp a vessel towards it. A portion of the hawser is coiled in the boat to insure reaching the destination; it is from the necessity of judging the distance by the eye that we have the term *guess-warp*.

Guest, John, Commodore U.S.N. Born in Missouri. Appointed from Arkansas, December 16, 1837.

Promoted to passed midshipman, June 29, 1843; frigate "Congress," Pacific Squadron, 1845–48; war with Mexico, battle of San Gabriel, Cal., January 8, 1848, battle of Mesa, Cal., January 9, 1848.

Commissioned as lieutenant, December 24, 1850; sloop "Plymouth," and "Susquehanna," in Japan Expedition, at the first landing of Americans in Japan, under Commodore Perry; East India Squadron, 1851–55; boarded with the cutter of the "Plymouth," at Shanghai, 1854, the Chinese man-of-war "Sir H. Compton," and liberated a pilot-boat's crew who were under the protection of the American flag; in April, 1854, was second in command of the "Plymouth," under Capt. John Kelley, in a severe and victorious action with the Chinese, at Shanghai, to prevent aggression on foreign residents; special duty, Washington, 1855–56; steam-frigate "Niagara," laying the first telegraph cable across the Atlantic, 1857–58; rendezvous, Philadelphia, 1859; frigate "Niagara," returning Japanese Embassy to Japan, 1860; commanding steam-frigate "Niagara," West Gulf Blockading Squadron, 1861; in command of the boats of "Niagara," cut out the schooner "Aid," then under the protection of Fort Morgan, Mobile Bay, August, 1861; commanding steamer "Owasco," West Gulf Blockading Squadron, 1862; at Forts Jackson and St. Philip, and capture of New Orleans, 1862; battles on the Mississippi up to and including Vicksburg, 1862.

Commissioned as commander, July 16, 1862; commanded "Owasco" at the capture of forts at Galveston City; commanding ironclad "Sangamon," the first U. S. vessel fitted with a spar-torpedo, the invention of Capt. Guest, South Atlantic Blockading Squadron, 1863; commanded the "Galatea," on convoy duty in West Indies, in 1863–65; commanding steamer "Iosco," North Atlantic Blockading Squadron, 1864–65; present at the two attacks on Fort Fisher.

Commissioned as captain, July 25, 1866.

Commissioned as commodore, December 12, 1872; senior officer of Board of Inspection of Vessels, 1872–76; commandant navy-yard, Portsmouth, N. H., 1877–78. Died January 12, 1879, while in command of Portsmouth Navy-Yard.

Guest-warp Boom. An old term for the swinging-boom.

Guffer. A British sea-fish of the blenny tribe, remarkable as being ovo-viviparous.

Guide-blocks. In the steam-engine, adjustable metallic pieces, with parallel sides, fitted to a cross-head and sliding in guides for keeping the axes of piston-rods coincident with or parallel to that of the cylinder. Sometimes called cross-head gibs. Blocks of wood or metal used to constrain a moving body to a given path.

Guillem. A sea-fowl. (See Lavy.)

Guillemot. A web-footed diving sea-bird allied to the auks.

Guimad. A small fish of the river Dee.

Guinea-boat. A fast-rowing galley, of former times, expressly built for smuggling gold across the Channel, in use at Deal.

Guinea-man. A negro slave-ship.

Guinea-pigs. The younger midshipmen of an Indiaman.

Gulden. A name for a water-fowl.

Gulf. A gulf is a wide opening from the sea, generally larger than a bay. Many gulfs, however, are really bays, and many bays are larger than most gulfs. The number of gulfs is much less than of bays. Keith Johnson enumerates about 170, of which 88 are in Europe, 39 in Asia, 13 in North and 10 in South America, 12 in Oceanica, and 8 in Africa. There are more gulfs, as there are fewer bays, in Corsica and Italy, there being 15 in the former and 13 in the latter country. Norway, Sweden, Denmark, Holland, and Spain have no gulfs, if we except the Bothnia Gulf, washing the shores of Sweden. Prussia has but the Dantzic Gulf, France only the Golfe du Lion, and England the gulf called "The Wash." On the north of Europe there are 6, on the east 9, in the Baltic 4, in the Mediterranean 64, on Black Sea coasts, 4. Fewer arms of the sea penetrate the other great divisions of the earth's surface, especially the *solid* continents of Africa and South America. Under the head of gulfs are included the bodies of water named in Scotland *firths*, and on the coast of Africa and Australia, *bights*.

The great gulfs of the world are 9 in number. Others are not much less in size or importance, but many are small and of comparatively little importance commercially, physically, or historically.

The two great gulfs of Europe are the Bothnia Gulf and the Gulf of Finland, both arms of the greater Baltic Sea. Of these, the more northern is the Gulf of Bothnia, extending from 60° to 66° N. lat., and from 18° to 25° E. lon., being about 400 miles long and 120 average width. Into it empty 18 large rivers, 300 to 400 miles long, and an infinity of smaller streams, coming from the mountains and glaciers of Sweden and Finland, and the outlets of scores of lakes. These render its waters so fresh that it generally freezes over, and a Russian army crossed on the ice in 1809. It contains many groups of islands near both shores, and the mouth of the gulf is partly occupied by the Aland Archipelago, containing several large and many small islands. Many bays open into it, and a number of important cities are situated on or near the coasts, chief of which is Tornea, at the head of the gulf. Its harbors are more commodious than other parts of the Baltic, but it is not so deep, 20 fathoms being the most usual depth.

The Gulf of Finland, also an arm of the Baltic, is included between lat. 59° and 60° 30′ N. and lon. 22° and 30° 30′ E., entirely within the limits of Russia, being 200 miles long and 60 miles average breadth. Its harbors are more numerous than those of Bothnia Gulf, but its navi-

gation is more difficult. Many large rivers empty into it, fed by the waters of large lakes, as Ladoga, Peipus, etc. The Neva is the largest of these rivers. Numerous bays and inlets indent the shores, and multitudes of small islands line them. The city of St. Petersburg is situated near its head, and Revel, Viborg, and other important places are near its coasts. The navigation of the gulf is important and its commerce considerable, although interrupted by the rigors of the climate.

Asia possesses three gulfs of great size,—the Gulf of Siam, the Gulf of Aden, and the Persian Gulf. The Gulf of Siam extends from lat. 7° to 13° N. and lon. 99° to 105° E., containing about 76,000 square miles. It receives the waters of the Menan and a part of those of the Cambodia River. It washes the coasts of Siam and the Malay peninsula. It contains numerous islands, and its fisheries and commerce are important.

The Gulf of Aden is a narrow inlet by which the waters of the Red Sea find their way to the Sea of Arabia. It lies between lon. 44° and 52° E. and lat. 10° and 15° N., and washes the burning shores of Arabia and Abyssinia. A few small rivers empty into it, and half a dozen bays line the coasts. It contains but few islands, is deep, and easily navigated, but is excessively hot. Through it passes the commerce of India, going to the Suez Canal. Aden is the most important city on its shores. Its area is about 110,000 square miles.

The Persian Gulf is a sea or inclosed sheet of water, lying between Arabia and the Persian and Turkish dominions. It also empties its waters into the Arabian Sea by the Straits of
Ormuz, 32 miles wide. It is oval in shape, of
miles long, extending from lon. 47° to lon, for

among thiron "down" may vary several hours,
the depends mainly on the size of the charge
tid the state of the atmosphere. When the
charge is nearly melted it is stirred with wooden or iron poles to bring unmelted lumps up to the flame. When the iron is well down, a little is ladled out and run into a green-sand mold, cooled and broken, and from it the state of the charge is at once ascertained by the experienced eye of the founder. If not sufficiently decarbonized, the fusion is kept up with a continuance of the stirring, for on its proper decarbonization depend in a great measure the density and tensile strength. When all the furnaces are ready they are tapped at the same time, and the metal runs from them into the reservoir or "mixing basin," after which it goes into the runners of the mold and enters into it by the side gates,—generally one in each section from each runner, and with an upward direction. As the metal rises in the mold it is stirred and prevented from depositing dirt and scoria about the core and in the trunnions. When the mold is filled the tap-holes of the furnaces are plugged, but from time to time, for an hour or more, metal is poured in from a ladle to the riser to feed shrinkage. As soon as the furnaces are tapped the water is turned on from the hydrant, and entering the core-barrel through a metallic pipe reaching nearly to the bottom, finds its way up along the interior and out by the escape-pipe. Half an hour after casting, the change in temperature of the water having been brought to about 25° F., the flow remains constant from that time. The fires in the pit are lighted by dropping melted iron on them towards the end of the casting. When the change in temperature of the water has become constant, say in about fifteen hours, the core is withdrawn, the rope wrapping taking fire as it comes to the air. After the core is withdrawn, the water is conducted to the cavity left by it, and, welling

minute pores, within which the spores are to be found, growing in fours on the summits of slender stalks (*basidia*), easily visible under a magnifying power of about 200 diameters. The mycelium may, however, be detected with the naked eye as white threads lying between the bundles of woody fibre and parallel with them. Under the microscope, the mycelium is seen to consist of very minute branching filaments, matted or felted together.

Since the dry-rot fungus flourishes only under the conditions of moisture, darkness, and confined air, its growth may probably be prevented on shipboard by such a system of construction as shall afford free ventilation of the bilges, frame-spaces (by boring through filling-chocks and by openings on the spar-deck), spaces beneath store-room floors, and recesses behind bulkheads; by forced ventilation, as now practiced in the U. S. S. "Richmond"; and by keeping the holds and lower decks dry. Extensive experiments are now (1880) being prosecuted by the Navy Department with a view to the preservation of ship-timber from decay, by impregnation under pressure with carbolic acid ("Burnettizing"), and with barium sulphate (the "Thilmany process"), from which good results are hoped for.

Besides the pecuniary loss resulting from the ravages of dry-rot, it appears to afford a peculiarly favorable nidus for the development of the yellow fever poison, and the preservation of its vitality against the unfavorable influence of cold weather. See Yellow Fever.

Other fungi, such as a cobweb-like growth on the under side of wet planks (*Helminthosporium*), molds, and patches of surface discoloration, are common on shipboard, but do not appreciably influence the decay of wood.—*J. H. Kidder, Surgeon U.S.N.*

Dub. A term for a pool of deep smooth water in a rapid river.

Dubb. To cut off and smooth with an adze the superfluous wood. *To dubb a vessel bright*, is to remove the outer surface of the plank completely with an adze. Spotting with the adze to examine planks is also dubbing.

Dubbah, or **Dubber.** A coarse leathern vessel for holding liquids in India.

Dubhe. A standard nautical star in the Great Bear, *α Ursæ Majoris.*

Dublin. The capital city of Ireland, on the Liffey, close to its entrance into Dublin Bay, Irish Sea, 66 miles W. of Holyhead, and 135 miles W. of Liverpool. Lat. 53° 23′ 2″ N.; lon. 6° 20′ 5″ W. The harbor has been latterly much improved, and near the mouth of the Liffey are the Grand Canal and the custom-house docks, the latter occupying 8 acres; depth at low water 12 feet, at high tides 24 feet. The bay is noble and picturesque, and esteemed one of the finest in the United Kingdom; it is about 7 miles in breadth at its entrance, between Howth Head, on the north, and Kingston, on the south. Pop. 246,300.

Ducat. A well-known coin in most parts of Europe. See Money.

Ducatoon. A coin of the Dutch Oriental Isles, value about $1.70. Also, a silver coin of Venice, value about $1.10.

Duck. To dive, or immerse another under water. The finest canvas for small sails is sometimes called *duck;* but it is really a lighter cloth than canvas, and is much used by seamen and soldiers in hot climates for frocks and trousers.

Ducking. A penalty which veteran sailors inflict on those who, for the first time, pass the tropics, the equator, or formerly even the Strait of Gibraltar, and usually performed in a tub or half-butt, with the assistance of a few buckets of water; the usual fine, however, generally prevents the penalty being inflicted.

Ducking at the Yard-arm. A marine punishment formerly inflicted by the French for grave offenses; the criminal was placed astride a short thick batten, fastened to the end of a rope which passed through a block at the yard-arm. Thus fixed he was hoisted suddenly up to the yard, and the rope being then let go he was plunged into the sea. This operation was repeated several times, conformable to the sentence; a gun advertised the other ships of the fleet that their crews might become spectators. If the offense was very great he was drawn underneath the keel of the ship, which was called keel-hauling. See Keel-hauling.

Ducks. The general name for a sailor's dress in warm climates.

Duck Up. To raise the clew of the mainsail or foresail when it interferes with the steering by shutting out the landmarks.

Dudgeon Wrath. An old word for the box-handle of a dirk.

Duds. A cant term for clothes or personal property. The term is old, but still in common use, though usually applied to clothing of an inferior quality.

Duel. In former days duels were of frequent occurrence in the navy, but latterly they are almost unknown. It is forbidden by the regulations to send or accept a challenge to fight a duel or act as second in a duel, and courts-martial are empowered to inflict any punishment for this offense, except death, flogging, or imprisonment at hard labor.

Duff. A sort of pudding. The posterior.

Duffer. A low peddler. A woman who assists smugglers. A stupid or cowardly fellow.

Dugong. An herbivorous mammal of the East Indian seas, intermediate between the *Cetacea* and the *Pachydermata*, having an elongated body, with flippers near the head, and terminated by a crescent-shaped tail.

Dug-out. A canoe hewn from one tree.

Duguay-Trouin, René, one of the most illustrious of French sailors, was born at Saint Malo, 10th of June, 1673, and died at Paris, 27th of September, 1736.

He came from a family of sailors, but was himself destined from childhood to be an ecclesiastic, going early to the College of Rennes, where he donned the soutane, and received the tonsure, with a view to succeeding to a rich benefice which friends of his family had in their gift.

His father died when he was only fifteen, and he was then sent to Caen to study philosophy. Here his sanguine temperament and love of pleasure caused him to break bounds, and he neglected his studies for the dissipations of a large city. His escapades at last became quite notorious, and he was forced by his family to return to Saint Malo, whence he was soon sent to sea in the *corsaire* "La Trinité," in which his

family had a large interest. This was in 1689. He remained in this vessel for two years, undergoing considerable hardship, but always distinguished for his conduct in numerous engagements with English and Dutch vessels.

After this apprenticeship, he went to sea in another vessel, of 18 guns, when he showed so much courage and conduct that he was given a command, being then only 18 years of age. After this he continually distinguished himself by attacks upon the English shipping, both in privateers and in vessels of the state. In 1694, while in command of the "Diligente," a 40-gun frigate, he was surrounded by an English squadron of six men-of-war, under Admiral Sir David Mitchell. After fighting for twelve hours, his crew were nearly all killed or wounded, he himself was wounded, and his ship on the point of sinking, so he was obliged to surrender. He was imprisoned at Plymouth, where he managed to make a friend of a pretty bumboat woman, and with her assistance escaped in a small boat, with his lieutenant, his surgeon, the boatswain, and a servant. After forty-eight hours of very rough weather they managed to reach the coast of Brittany.

He was soon at sea again, in a ship of 48 guns, in which he took two English men-of-war of superior force, one of which he brought in. For this action he received a sword of honor, and was invited to join the fleet of the Marquis de Nesmond, where he had his usual success in making prizes.

After this cruise he went to Paris, to be presented to Louis Quatorze, and received many honors while there. He did not remain long, however, returning to his sea-life, and had command of several small squadrons, which he handled with his accustomed ability, having been made *capitaine de frégate* of the royal marine.

After the peace of Ryswick he passed four years of enforced idleness; but upon the breaking out of the war of the Spanish succession, he was again promptly at sea, serving against the Hollanders and the English, in which he passed through many battles and many perils. In 1705, when thirty-two years of age, he was made *capitaine de vaisseau*, and very shortly after, in consequence of continued successes against the Portuguese, English, and others, he, with his elder brother (two younger ones had been killed while serving under him), received letters of nobility.

In 1711 he sailed, in command of a fleet of 7 line-of-battle ships, 8 frigates, and 2 bomb-vessels, with nearly 6000 men, for Rio de Janeiro. He entered the bay under the fire of the Portuguese batteries, and the next day disembarked his force. After some slight resistance the city was abandoned by its inhabitants. Duguay-Trouin then threatened to utterly destroy the place unless a handsome ransom was paid. This was done, and he then set out on his return to Brest, but lost two of his largest vessels on the voyage,—sunk in a hurricane. For this action he received a pension of 2000 crowns and the title of commandant of the marine of Saint Malo; and in 1715, at Versailles, he received the commission of admiral of the fleet.

Louis XIV. died soon after this, and Duguay-Trouin remained at Saint Malo in retirement until 1723, when, under the regency, he was made a councillor for India. In 1728 he was made commander of the order of St. Louis and lieutenant-general. The next year he was made commandant of marine of Brest and of the coasts of Brittany. In 1731 he commanded a fleet fitted out to punish the Barbary corsairs, but the appearance of the force so imposed upon the Moors that they gave every satisfaction without any fighting. Although he continued in service, this was his last active employment. His labors and exposure had undermined a naturally vigorous constitution, and he died in Paris at 63 years of age.

Duguay-Trouin was so disinterested and generous that, in spite of his many captures, he died comparatively poor. His officers and sailors fairly worshiped him, not only on account of his intrepidity, but because of his liberality in regard to prize-money. A statue of him is erected in the "Place Duguay-Trouin," at Saint Malo.

A portrait of this intrepid sailor is in the city hall, and in the museum at Versailles is a statue of him in black marble. The portrait represents him in a rich military costume, decorated with the order of the Holy Ghost. On his bandolier are the arms granted him by Louis XIV.,—two fleur-de-lis and an anchor. He holds a pistol in his right hand, while the left grasps the hilt of his sword. His hat is ornamented with plumes, which, in our day, is not considered naval. There is also a statue of Duguay-Trouin in the Bourse, at Nantes, and there are two other well-known oil-paintings of him. He is represented with a youthful and animated countenance, wears a huge wig, and a coat above his cuirass.

His arms appear upon the picture (given by Louis XIV.),—the fleur-de-lis and anchor,—and the legend, "Didit hæc insignia virtus."—*E. Shippen.*

Duke of York (*Eng.*). A nickname for a peculiar storm-trysail used in the northern seas.

Dulce, Dulse, Delse. One of the edible fuci, *Iridea dulce.* It is plentiful on the rocky coasts of Ireland and western England. It probably derived its name from being sweet and pleasant, not requiring cooking.

Duledge Plate. An old name for the tire or iron plate on the circumference of the wheel of a field-piece. Duledge was also used for dowel, the wooden pin connecting the felloes.

Dull'd. Fallen or moderated; said of the wind.

Duluth. A city and port of entry of Minnesota, the capital of St. Louis Co., is finely situated at the W. end of Lake Superior, and is the eastern terminus of the Northern Pacific Railroad. Lat. 46° 48′ N.; lon. 92° 6′ W. Duluth has a very advantageous position for a commercial city, being at the head of navigation on the great lakes. Pop. 3300.

Dumb-chalder. A metal cleat bolted to the back of the stern-post for one of the pintles to rest upon, to lessen both strain and friction.

Dumb-craft. Lighters, lumps, or punts, not having sails. A name for the screws used for lifting a ship on the slip.

Dumb-pintle. A peculiar rudder-strap.

Dumb-scraping. Scraping wet decks with blunt scrapers.

Dumb-sheave. An aperture without a sheave, through which is rove a rope.

Dumfounder. To confuse or perplex.

up, emerges through a hole in the riser formed by casting in a wrought-iron pipe near the top. Half an hour after removing the core the change in temperature of the entering and escaping water should be brought to about 100° F., when the flow should be kept constant. It is generally several days before the fires in the pit are allowed to die out, and when the gun becomes sufficiently cool the flask is removed all but the breech-section, the gun hoisted out of the pit, the sand and dirt scraped and cut away, and it is ready to go into the finishing-shop.—*H. W. Lyon, Lieutenant U.S.N.*

Guns, Inspection and Proof of. All cannon for the navy, manufactured wholly or partly at private establishments, are fabricated in strict accordance with the terms of the contract made with the Bureau of Ordnance, and subject to the inspection of an officer detailed to supervise the operations. During fabrication or alteration, the metal of guns is closely examined and tested when necessary, and the pieces themselves are examined and measured inside and out in the various stages of manufacture; as the detection of defects and errors that pass the limits of toleration may save useless subsequent labor. Internal defects of metal will often be betrayed by a close examination of the core pieces and interior of bore. As rust tends to conceal defects, examination of the guns takes place before exposure to the weather; and previously to the final examination and proof of guns they are not to be covered with paint, lacquer, oil, or any material which may hide defects of metal. As the water proof, which is of great importance in detecting defects of metal not otherwise developed, necessarily succeeds immediately the powder proof, and can be effectively applied only in fine weather and when the temperature is above the freezing-point, final inspections are made at such times only. If it is ascertained that any attempt has been made to conceal defects, the gun or guns so treated are rejected without further examination.

Instruments. 1. A mirror, for reflecting the sun's rays into the bores. Two will be required if the sun be in the rear of the inspector.

2. A lamp attached to a staff, for examining the bores when the sun is obscured or the guns are under cover.

3. A standard cylinder-gauge.

4. A measuring staff of steel or iron.

5. A chamber-gauge, for verifying the shape and size of conical chambers.

6. A star-gauge, for measuring the diameter of the bore and the chamber.

7. An instrument for verifying the interior position of the vent.

8. Profile-boards for distances in front and rear of the base-line.

9. A trunnion-square of steel or iron, for ascertaining the position of the trunnions with reference to the axis of the bore.

10. A trunnion-gauge, an iron ring of the proper diameter of the trunnions.

11. A trunnion-rule, for measuring the distance of the trunnions from the base-line.

12. A beam-caliper.

13. A cylindrical block, for verifying the size of the breeching-hole.

14. A vent-guide.

15. Vent-gauges of untempered steel wire, with shoulders to prevent them from slipping into the vent.

16. A vent-searcher, a steel wire of the length of the vent, bent to a right angle at the lower end and pointed.

17. A semicircular protractor, of metal, for measuring the inclination of vents or for ascertaining their deviation from the guide.

18. A set of templates, for verifying the shape of lock-lugs, the angle of the rear sight-mass, the curve between the base-line and the front of rear sight-mass, that at the end of the cascabel, the bevel of the breeching-hole, the opening of the cascabel, and the shape of the muzzle-swell.

19. A standard foot-rule, for verifying measures.

20. A foot-rule of steel, for measuring the masses, the length of the trunnions, and for other purposes.

21. A set of ring-gauges, large, medium, and small, for inspecting the projectiles used in proof.

22. A small beam-caliper, with outside edges, for examining the adjusting rings and the ring-gauges.

23. A platform-balance, for weighing the projectiles used in proof and for bringing the shells up to the standard weight.

24. A set of implements for loading and cleaning.

25. A searcher with six or more points, to detect injuries in the bore.

26. A machine for taking impressions of the vent.

27. Hydraulic pump and apparatus for the water proof.

28. Dies for marking.

29. Instruments for determining the velocity of projectiles.

30. A set of internal pressure-gauges.

Powder proof. Powder for the proof of guns must show the highest initial velocity usually exhibited by service powder used in guns of the same calibre and class as those under proof. It must, when possible, be of the same kind, but in any event must assimilate most closely to the service charge in its rate of burning and in the character of the pressures developed. It must be carefully weighed (never measured) and be filled in service cylinders and well settled. The "density of loading" must be the same as for service.

The projectiles must be of full weight and not below the mean gauge; the shells must be filled with a mixture of sand and ashes or sawdust to bring them up to the proper weight of the filled shell. Sabots are used for spherical shell and a grommet-wad over the shot; no wad of any kind is placed over a rifle projectile.

The spiral or other standard gauge for determining the pressure in the bore must be used, and the results recorded carefully after each round.

Gutta-percha or wax impressions of the bore of rifle guns should be taken before and after proof, and the bore should be carefully star-gauged. These impressions and star-gauging must be compared to discover whether any defects have been developed during the powder proof.

Water proof. The pressure to be applied in the water proof is two atmospheres, or 30 pounds to the square inch. The penetration of water

in this proof through the metal of the piece in any place will cause the rejection of the gun; and if, on examination after the water proof, there shall be any defects indicated by weeping or dampness in the bore, the gun will be rejected. The water proof is alone to be depended on to detect minute clusters of cavities in the bore, which for this purpose should be perfectly dry and examined by sunlight. All inspections, consequently, should take place in fair weather and when the temperature is above the freezing-point.

Extreme proof. After undergoing the ordinary proof established for its calibre and class, the gun selected for extreme proof is subjected to at least 1000 rounds with service-charges.

GUNS, MARKING OF. Guns for the naval service, received by authority of the Bureau of Ordnance, are marked in the following manner, viz.:

On the cylinder, in the line of sight near the sight-mass, all accepted guns have stamped an anchor two inches long.

On the base-ring, or line, the initials of the foundry, the register number, and the weight of gun in pounds.

On the right trunnion, the calibre and year of fabrication.

On the left trunnion, the letter P and the initials of the inspecting officer; all the above in one-inch letters.

On the upper jaw of the cascabel, the preponderance in pounds is stamped lightly with half-inch figures.

On the end of the upper jaw, the cascabel block and head of the pin, the foundry number in quarter-inch figures.

The foundry number is also marked on the right rim-base.

Guns rejected for imperfections of any kind will have the letter C stamped on the anchor, so as to partially obliterate it.

The founders are to be dissuaded from selling such guns to other parties, and required to break them up.

Guns rejected for such defects as render them dangerous to those who fire them should be irreparably mutilated, with the consent of the founder.

GUNS, ENDURANCE OF. The endurance of a cast-iron smooth-bore gun with service-charges may be surely predicted by observation of the progressive wear of the interior orifice of the vent. There are certain general forms in which this enlargement takes place. They may be classed as triangular, lozenge, quadrilateral star, circular, and elliptic.

With the ordinary central vent, when subjected to a rapid continuous fire, the enlargement usually takes the form of an isosceles triangle, the apex of one of the angles towards the muzzle and the other two perpendicular to it. With the lateral vent of the Dahlgren system it usually takes the lozenge form, the cracks extending from the opposite angles lengthwise of the bore.

With those rifled cannon in which the vent is bouched, the cracks appear round the bouching; and although the bouching preserves the vent, yet the formation of fissures around the enlarged orifice, when once commenced, causes a greater tendency to rupture. With the vent not bouched, the wear in cast-iron rifled cannon is about double that of the smooth-bore. So long as the wear of the vent is regular and without cracks, a mere enlargement is not indicative of danger; but when it reaches a diameter of four-tenths of an inch, the vent should be closed and a new one opened.

A gun of large calibre should not in service be expected to endure more than 400 or 500 rounds before it will be necessary to open the new vent; which, however, will be of no advantage unless the old one be closed at its interior orifice, on which the gases would otherwise continue to act as a wedge. The first distinct appearance of the cracks, as shown by the button, is the proper limit.

GUNBOAT. A light-draft vessel carrying one or more guns.

GUN-CARRIAGE. A carriage to facilitate the transportation and manipulation of howitzers or great guns. It must have the strength necessary to resist the shock of discharge, stability to retain its upright position when subjected to violent recoil or to the motion of the ship at sea, facility of working, simplicity, and durability. In the navy all gun-carriages except the boat-carriages are built of iron.

GUN-COTTON. See EXPLOSIVES.

GUN-DECK. See DECK.

GUN-FIRE. The firing of the morning or evening gun; familiarly termed "the admiral falling down the hatchway."

GUN-GEAR. Everything pertaining to the management of the guns.

GUN-HARPOON. See HARPOON.

GUN-LOD. A vessel filled with explosives.

GUN-METAL. A bronze consisting of 90 parts of pure copper and 10 parts of tin, allowing a variation of one part of tin, more or less. When the mixture is well made the metal is homogeneous; the fracture is of a uniform yellow color, with an even grain. Its specific gravity is about 8.75, being greater than the mean of the specific gravities of copper and tin. It should be rejected for the manufacture of guns if it contains an appreciable amount of sulphur, .001 of arsenic and antimony, .003 of lead, iron, or zinc, or in all more than .005 of foreign substances.

GUNNADE. A short 32-pounder introduced in 1814.

GUNNEL. See GUNWALE.

GUNNERY. A branch of the military art which has for its object the management of guns and mortars, and of charging and pointing them so as to hit a proposed mark at any distance within the range of the projectile. To accomplish this purpose it is necessary to know the nature of the path which a projectile describes in the air with a given initial velocity, the quantity of gunpowder necessary to produce that velocity, and the elevation that must be given to the gun in order to counteract the effect of gravity and the resistance of the air on the projectile in its flight. Various other considerations require also to be attended to; as the proportion between the length of the gun and the diameter of its bore, the system of rifling, the proper windage, or excess of the diameter of the bore above that of the projectile, the shape of the chamber, the strain upon the metal, and the size or weight of projectile proper to produce a certain effect, as to batter down a wall or to penetrate a ship's side. In a more comprehen-

sive sense, gunnery includes the whole science of artillery and ordnance.

GUNNERY-LIEUTENANT (*Eng.*). One who, having obtained a warrant from a gunnery-ship, is eligible to large ships to assist specially in supervising the gunnery duties; he draws increased pay.

GUNNERY-SHIP. One devoted specially to the training of officers and men in everything pertaining to ordnance.

GUN PENDULUM. A device employed to determine the initial velocity of projectiles by means of the recoil of the gun. The principle is that the explosive force of the powder communicates equal quantities of motion to the gun and to the projectile in opposite directions; consequently, by suspending the gun, loaded with additional weights, in the manner of a pendulum the extent of its arc of vibration will give the means of estimating the quantity of motion impressed on it, whence the initial velocity of the projectile can be computed. See BALLISTIC PENDULUM, ELECTRO-BALLISTICS.

GUN-ROOM (*Eng.*). A compartment at the after part of the lower gun-deck of a large vessel, partly occupied by the junior officers; but in a small vessel it is below the gun-deck and used as a mess-room by the lieutenants.

GUN-ROOM PORTS (*Eng.*). Stern-ports cut through the gun-room in a frigate.

GUN-SHOT. The distance a gun will throw a projectile. See RANGE.

GUN-SLINGS. See SLINGS.

GUN-STONE. An old term for a cannon-ball, from the circumstance that stone was the first material used for cannon-balls.

GUN-TACKLE PURCHASE. A purchase rove through two single blocks. See TACKLES.

GUNWALE (corruption of *gun-wall*). In small craft, the fore-and-aft plank which covers the heads of the timbers.

Gunnel. A spotted ribbon-bodied fish found on rocky bottoms.

Gunner. From the period when ordnance was introduced on board British vessels of war this officer appears to have formed a distinctive class in the royal navy. The complement of the "Henri, Grace de Dieu," consisted of 349 soldiers, 301 marines, and 50 gunners; these gunners correspond to what are now called seaman-gunners. Gunners are warrant-officers, and, under the ordnance-officer, have special charge of the battery, small-arms, magazines, and ordnance stores. For necessary qualifications for appointment, see EXAMINATIONS.

GUNNER, QUARTER. A petty officer attached to each gun-division to take care of the guns and gun-gear, and at quarters, to supply the guns' crews with belts, primer-boxes, etc., and to be ready, during action, to furnish any reserved or spare article that may be required, such as breechings, ladles, worms, etc.

GUNNER'S DAUGHTER. The name of the gun to which the men were *married* or lashed to be punished.

GUNNER'S GANG. The men under the direct superintendence of the gunner, including chief gunner's mate, gunner's mates, quarter-gunners, armorer, armorer's mate, etc.

GUNNER'S MATE. One of the assistants of the gunner, selected by the commanding officer for his experience and reliability. The gunner's mates are stationed in the magazines when at quarters, and in the event of the absence of the gunner, the chief gunner's mate assumes his duties.

GUNNER'S PIECE. The fragment of a burst gun which flies upward.

GUNNER'S QUADRANT. A graduated quarter of a circle of sheet-brass of 6 inches radius, attached to a brass rule 22 inches long. It has an arm carrying a spirit-level at its middle and a vernier at its movable end. To get a required elevation, the vernier is fixed at the indicated degree, the brass rule is then inserted in the bore parallel to the axis of the piece; the gun is then elevated or depressed until the level is horizontal. There is also a graduated quadrant of wood, of 6 inches radius, attached to a rule 23.5 inches long. It has a plumb-line and bob, which are carried, when not in use, in a hole in the end of the rule, covered by a brass plate.

GUNNER'S TAILOR (*Eng.*). An old rating for the man who made the cartridge-bags.

Gunner-flook. A name for the turbot, *Pleuronectus maximus.*

Gunny. Coarse canvas made of fibrous material, as jute.

GUNNY-BAG. A sack made of gunny.

Gunpowder. Gunpowder is made of saltpetre, charcoal, and sulphur, in proportions now generally adopted of 75 parts saltpetre, 15 charcoal, 10 sulphur. The objects to be obtained are:

1. Maximum force.
2. Minimum of initial pressure in bore of gun.
3. Uniformity of action.
4. Freedom from fouling.
5. Durability.

Saltpetre, a compound of 54 parts nitric acid and 46 parts of potash, contains in one volume as much oxygen as is contained in 3000 volumes of atmospheric air. This oxygen when heated to a certain degree combines instantly with the carbon to form carbonic acid and carbonic oxide, and which with free nitrogen form the chief gaseous products of combustion. The potassium is found combined in the solid residue.

Charcoal. Willow and alder are chiefly used. The smaller branches, ½ inch to 1 inch in diameter, are cut in spring when the sap is running, and the bark peeled off. It is generally left to season for a year.

Sulphur. The oxidation of sulphur by saltpetre produces a higher temperature than is obtained with charcoal, and this accelerates combustion.

The ingredients should be thoroughly pulverized before being combined.

The saltpetre being thoroughly dried, is ground in a buhr-stone mill. The charcoal and sulphur, in proper proportions, are placed in iron cylinders or barrels, about 3 feet in diameter and 4 feet long, which have iron bolts placed in them about 1 inch in diameter. The barrels being revolved at about 15 revolutions a minute, are run about 24 hours. The bolts in the drums completely pulverize the ingredients.

The saltpetre, sulphur, and charcoal being pulverized, have now to be incorporated into one mass. There are several modes of doing this,—stamper-mills, wheel-mills, barrel-mills, and a new method of recent invention by Gen. P. A. Oliver, roller-mills.

Barrel-mills consist of a number of barrels about the size of a whisky-barrel, geared to revolve at about 15 revolutions per minute. They each contain about one-half bushel of common marbles; the ingredients sufficient for 8 or 10 kegs of powder are then placed in each, and the barrels are run for about 10 hours. After a steady run they should be stopped and opened and allowed to cool, and then started up again. The marbles in the drums pulverize the ingredients thoroughly.

The powder-meal may now be placed in bins and slightly dampened before going to the press. If desired to still further incorporate it, it is taken to the wheel-mill. A wheel-mill consists of two heavy broad wheels about 2 feet in diameter and 5 or 6 feet high, resting on a bed-plate; they are revolved by a vertical shaft passing through the centre of the bed-plate, to which the axle revolving the wheels is attached. Two plows or knives, one near the vertical shaft and another near the rim, throw the composition under the runners as it works outwards. The charge is spread upon the bed evenly, and a small amount of water sprinkled upon it. Water is added from time to time in sufficient quantity to reduce the effect of explosion, and to incorporate more thoroughly. The wheels are revolved at 8 or 10 revolutions a minute, and from 4 to 8 hours, according to the powder to be made. After the powder has become incorporated, it is taken to the hydraulic press to be pressed into cakes. The mass is placed upon the press in layers, plates of copper or gutta-percha intervening. Eight or twelve hundred pounds are pressed at a time. A pressure of 6000 to 10,000 pounds to the square inch is exerted. When sufficiently pressed, the press-cake, looking like slate $\frac{3}{4}$ to $1\frac{1}{2}$ inches thick, is taken to the coining- or graining-mill. This mill serves to break up the powder into grains. It consists of a series of adjustable rolls, the top one, of gun-metal, being a toothed roll, to break up the cake; under this is another set of rolls geared two to one, which crush the sizes which are too large, and another set under these still further reduce the remaining grains. Sieves shake the dust out of the powder, and other screens of wire-cloth, of different-sized mesh, retain the sizes desired and reject those that are too large, which are carried back to the hopper of the mill by an elevator to be ground over again. The size and shape of the grain form an important factor in our service. Large grains of spherical shape are made to reduce the pressure on the gun, as large grains of that shape burn slower, but it is always at the expense of the powder. It is not the fault of the powder that the gun bursts: it is the fault of the gun. By firing the charge, next the ball, and using three sections of powder, slow, quicker, and very quick, a better result will doubtless be obtained than has hitherto been reached, and more justice done to the powder. After being broken up into grains, the powder is dried at a temperature of about 130° F. Some use boxes or pans, in which the powder is placed in the drying-rooms heated by a furnace. A new patented method, termed hot-air glaze, in which the powder is placed in revolving drums and hot air blown through them, is used by some manufacturers.

The powder is next finished by being placed in the glazing-drums. These consist of large barrels about 3 by 6 feet. In these the powder is placed. The drums are then revolved at about 15 revolutions a minute. The grains of powder are tumbled about in them and rubbed against each other. In the process the powder gets warm and sweats a little, which facilitates the rounding off of the sharp corners. The powder is usually revolved in these drums from 12 to 24 hours, according to the glaze required. When high bright polish is needed, a small quantity of graphite is added. The glazing takes off the rough and sharp edges of the grain, and the powder occupies less bulk in consequence, packs closer, and makes less dust.

In the Oliver process, the ingredients being thoroughly mixed and dampened, are placed in small boxes holding 25 pounds at a time. A box at a time is then placed in the hopper of the incorporating-mill. These consist of 5 pairs of adjustable rolls, with a top pair of rolls regulating the feed. The ingredients passing between these rolls in a very thin stream are intimately ground by each set of rolls successively, the rolls being geared two to one, and pass in a thin train by a rubber apron out-doors, and are dumped into another box holding 25 pounds. When full, this box is carried to the hopper of the press. By this method there are never over 50 pounds damp powder in the incorporating-mill, and outside. This quantity can be reduced to 5 or 10 pounds if desired. The object is to have so little powder in any one place as to do away with any serious damage in case of fire. The ingredients being incorporated, are next taken to the press- and graining-room, both being combined in one. The box of powder is dumped into the hopper of the press, and is immediately pressed into sheets of the desired thickness between 2 large rolls running at equal speed. A belt running under the rolls carries the pressed powder forward under the grainer. This machine consists of knives set in a frame, which is arranged to move up and down by means of an eccentric, cutting the powder as it passes under them. The grained powder next falls upon a shaker, arranged with different-sized screens. The dust is immediately shaken out, and an elevator carries it back into the hopper of the press to be pressed over again. The grains which are too large are brought back by an elevator, and are reduced to the desired size by a pair of rolls of zinc running two to one, placed at the end of the shaker; a second shaker outside the building shakes the balance of the dust out, reassorts the sizes, and dumps the grains into a box holding 150 pounds. This box is at once taken on a car to the dry-house. The dry-house contains the dryer, the joint invention of Patrick Clarch, of Rahway, N. J., and Gen. Oliver. It consists of a box 60 feet long by 14 wide, air-tight at all points except the top. It is furnished with a number of wooden rollers on the top, which revolve in suitable bearings; at each end is a large pulley or roller 3 feet in diameter and 12 feet long. A woolen cloth is placed around these rollers, forming an endless belt, over the whole top of the dryer. The powder is placed on top of the woolen cloth, and the large pulleys revolving, move the cloth forward very slowly. The damp powder goes on at one end, and the dry is dumped off at the other; as it falls it goes over screens, which take out the dust and dump it into boxes. An adjoining building contains

an engine, steam coil, and powerful blower,—pipes lead from coil into box of dryer. The air is blown through the coil, thence into box of dryer, and is forced through the cloth upon which the powder rests, and it is thus dried in a couple of hours.

Gunten. A boat of burden in the Moluccas.

Gunter's Chain. The chain ordinarily used in surveying.

Gunter's Line. A logarithmic line on Gunter's scale, used for performing, mechanically, the operations of multiplication and division.

Gunter's Scale. A wooden rule, on one side of which are marked scales of equal parts, of chords, tangents, sines, etc., and having on the other logarithms of these various parts, by means of which many problems in navigation and surveying may be solved mechanically.

Gurge. A gulf or whirlpool.

Gurnard. A fish of the genus *Trigla*, so called from its peculiar grunt when removed from the water; its head being all skin and bone gave rise to the saying that the flesh on a gurnard's head is rank poison. One or two species are known by the local name of *piper*.

Gurnet. See GARNET.

Gussock. A term for a strong and sudden gust of wind.

Gust, or **Gush.** A sudden blast of wind; a squall.

Gut. A somewhat coarse term for the main part of a strait or channel, as the Gut of Gibraltar, Gut of Canso.

Gutter-ledge. A cross-bar laid along the middle of a large hatchway in some vessels, to support the covers and enable them the better to sustain any heavy body.

Guy. A rope used to support a spar in a lateral direction; as, the jib-guys. A rope used to steady a body when hoisted or lowered.

GUY, BELLY-. A rope supporting the middle part of derrick or sheer-leg.

GUYS, JIB AND FLYING JIB. These go over the ends of their respective booms, leading thence to the ends of the whiskers, and set up at the bows.

GUYS, LOWER-BOOM. Ropes used for rigging in and out, and for steadying the lower-boom when rigged out. The standing part of the forward guy is secured at the end of the whisker, and leads thence through a block on the boom, thence through a block at the bowsprit-cap, thence to the forecastle The standing part of the after guy is hooked to a bolt in the ship's side near the gangway, leading thence to a block on the boom and back through a sheave in the ship's side. The lower-boom guys are sometimes fitted single, hooking to eye-bolts on the boom.

GUYS, SPANKER-BOOM. Fitted in one with the sheets. See SHEET.

Gwiniad. A fish (the *Coregonus fera*, or fresh-water herring) found in North Wales, and allied to the lake white-fish.

Gybe. Another form for *jibe* (which see).

Gymnotus Electricus. An eel from the Surinam River, several feet in length, which inflicts electrical shocks.

Gyn. A three-legged machine fitted with a windlass, heaving in the fall from a purchase-block at the summit, used on shore for mounting and dismounting guns, driving piles, etc.

Gyp. A strong gasp for breath, like that of a fish just taken out of the water.

Gyver. An old term for blocks or pulleys.

Gyves. Fetters; the old word for handcuffs.

H.

H. Abbreviation for *have* in the U. S. General Service Signal Code. Among the letters used in the log-book to register the state of the weather, *h* denotes *hail.*

Haaf. Cod, ling, or tusk deep-sea fisheries of the Shetland and Orkney islanders.

HAAF-BOOT. One fitted for deep-water fishing.

Haak. See HAKE.

Habeas Corpus (Lat. *You may have the body*). In law, the name given to a variety of writs (in the ancient forms of which these were the emphatic words) having for their object to bring a party before a court or judge. The most celebrated of these is the writ (*Habeas corpus ad subjiciendum*) to inquire into the cause of a person's imprisonment or detention with a view to obtain his or her liberation.

Hack. A word applied to a watch or chronometer used in taking observations, to obviate the necessity of moving the standard chronometer.

Hackatee. A fresh-water tortoise having a long neck and flat feet, and weighing from 10 to 15 pounds, which is found in the West Indies.

Haddock. The *Gadus æglefinus*, a species of cod fabled to bear the thumb-mark of Saint Peter.

Hag. An eel-like fish (the *Gastrobranchus* (*Myxine*) *glutinosus*) having a cartilaginous skeleton, a ring-like mouth, a strong tooth in the palate, and two rows of teeth, by which it enters other fishes and devours them. It is about 5 or 6 inches long, and is allied to the lamprey. It is found in polar seas.

Hag-boat. See HECK-BOAT.

Hag's Teeth. Those parts of a matting or pointing interwoven with the rest in an irregular manner, so as to break up the uniformity.

Haik. See HIKE.

Hail. To call, to accost; thus one vessel *hails* another at sea, the customary form being "Ship ahoy!" A sentinel *hails* when he challenges. A ship is said to *hail* from the port to which she properly belongs; a man, to *hail* from the country of his birth or residence. *Pass within hail,*

a special signal to approach and receive orders or intelligence, when boats cannot be lowered or time presses. *Hail fellows*, congenial messmates.

HAIL-SHOT. Small shot for cannon.

Haimura (*Erythrinus macrodon*). A large fresh-water fish of Guiana, highly esteemed for the table.

Hair-bracket. The molding which terminates the fore ends of the head-rails, and comes at the back of the figure, and breaks in fair with the upper deck.

Hair-tail (*Trichiurus*). A genus of acanthropterous fishes, sometimes classed in the Ribbon-fish family, but more generally referred to the family *Scomberidæ*. In Cuba it is known as the *sabre-fish*, and in other parts of the world as the *blade-fish*.

Hair-trigger. A trigger whose movement is effected by a very slight force. Its action is communicated to the tumbler-catch by means of a device called a *hair*.

Hake. An old term for a hand-gun. Also the fish *Gadus merlucius*, a gregarious and voracious fish of the cod family, termed also *sea-pike*.

Hake's Teeth. A term for the *Dentalium*, a species of shell-fish whose presence in the British Channel serves as a guide to pilots in foggy weather. Also, a phrase applied to some parts of the deep soundings in the British Channel.

Halcyon Piscator. A bird of the king-fisher kind, so called from its supposed identity with the halcyon of antiquity. The ancients called the seven days that precede and follow the winter solstice *halcyon days* from the circumstance of the halcyon selecting that period for incubation. While this process was going on the weather was generally remarkable for its calmness. And hence the expression has passed into a proverb, signifying days of peace and tranquillity.

Hale. An old word for *haul*.

Half-beam. A beam which is of the same size as the ordinary deck-beams, and is cut off for some reason, as a long hatch, and which does not as a consequence extend clear across the ship.

Half-breadth of the Rising. A term used in the mold-loft, it being the distance beveled out from the centre-line taken at a mark which is at or near the head of the floor-timbers, and afterwards applied to the mold, and is used in the framing of the ship.

Half-breadth Plan. That on which is shown the form of the vessel by horizontal and diagonal longitudinal sections.

Half-cock. The position of the hammer of a fire-arm intermediate between those which it has when resting on the nipple, or firing-pin, and when drawn back to full cock. Arms should be habitually carried at half-cock, as in that state they are less liable to be accidentally discharged. *Going off at half-cock*, a metaphorical expression for speech, or action, which fails of effect because uttered, or taken, without due forethought or preparation.

Half-davit. A name for the *fish-davit*.

Half-deck. The portion of the gun-deck included between the mainmast and the cabin-bulkheads.

Half-floor. An expression used in the mold-loft to indicate the spoint at which the dead-rise of the ship is taken, which is at one-quarter of the breadth of the ship from the centre-line. Sometimes, in a wooden ship, floor-timbers are made, where the shape is difficult, in two pieces, and they are scarfed, tabled, and bolted together.

Half-hitch. A hitch formed by passing the end of a rope around the standing part and bringing it up through the bight.

Half-laughs and Purser's Grins. Hypocritical and satirical sneers.

Half-man (*Eng.*). A rating in coasters for a boy or landsman.

Half-mast. To lower a flag midway between the truck and deck, as a mark of respect for the dead. When flags are half-masted they are not hauled down from that position, but are run close up as the call is beaten.

Half-minute Glass. A time-glass used in logging a ship. A glass that runs 28 seconds is generally used as being more convenient.

Half-pay. A term with which we are more familiar in the pages of fiction than as a matter of fact. In English novels the half-pay officer is a frequent character, but in this country the expression describes nothing known to either our military or naval system. Even in England and other countries employing the term, or its equivalent, it is not confined to its literal meaning, but is used to signify a money allowance, less in amount—though not always to the extent of one-half—than the full pay of the officer receiving it. This allowance, in England, has not the same character in both services. In the royal navy it is the allowance, usually about 60 per cent. of the full pay, made to all officers not immediately wanted afloat; and as there are always many more officers, than appointments for them to fill, a considerable number are at all times on the half-pay list, and the expression thus becomes descriptive of a regular and recognized condition. In the British army, on the other hand, half-pay is a temporary grant either to officers thrown out of employment by the reduction of the corps with which they are serving, or those compelled to quit active duties by sickness, and is thus pertinent to a casual rather than a regular condition. The first grant of army half-pay was made by William III. in 1698.

Half-pike. An iron spike fixed on the end of a short ashen staff, used in repelling the assaults of boarders.

Half-port. The ports are fitted with heavy shutters having a circular hole to receive the gun when it is run out. These ports are made in two pieces, each piece being called a *half-port;* and when in action the upper one is passed inboard or triced up, and the lower one is lowered. In port, during fine weather, they are kept parallel with the water.

Half-sea. An old term for mid-channel. *Half-seas over*, moderately drunk.

Half-tide Rocks. Rocks awash at the middle of the tide.

Half-timbers. Those timbers in the cant bodies which are answerable to the lower futtocks in the square bodies.

Half-top. See TOP.

Half-topsails Under. An expression to signify that a vessel is so far distant that she is below the horizon with the exception of that portion

of her spars and sails from the middle of the topmast up.

Half Watch-tackle. A luff-purchase.

Halibut (*Hippoglossus vulgaris*). One of the largest kinds of flat-fish, found in great numbers on the Atlantic coast, and much esteemed as food, its flesh being firm and white, though somewhat dry. It is found on the British coast, but more abundantly in the northern than the southern parts. The Greenlanders use it extensively, and obtain oil from it in considerable quantities.

Halifax. A city and seaport, capital of Nova Scotia. Lat. 45° N.; lon. 63° 35′ W. Situated on the west side of Chebucto Bay, now called Halifax Harbor. The city contains many large and handsome buildings, among which can be numbered the provincial buildings, military and naval hospitals, barracks, and military jail. At the northern end of the city is the royal dock-yard, covering 14 acres, the finest in the British colonies. The harbor is 6 miles long by 1 in width, with excellent anchorage in every part of it, and at the north end it is connected with Belford Basin, 6 miles by 4 in size, capable of containing all the navies in the world. The city is protected by 11 fortifications, and is the chief naval station of British North America. Pop. 32,500.

Halley's Chart. The chart showing, by curves, the variation of the compass.

Halliards, Halyards, or Haulyards. The rope or purchase employed to hoist a yard or sail on its mast or stay. All yards have halliards except the lower,—these being kept stationary ordinarily; when they are hoisted or lowered the jeers are used.

Topsail-yards have a permanent purchase, variously rigged according to the size of the yard. *Top-gallant* and *royal* yards are hoisted by means of the yard-rope, a tackle being clapped on abaft the mast. *Jib-* and *stay-sail*-halliards are bent to the head-cringles of their respective sails, and lead thence along the stay to a block under the collar of the stay, and down to the deck; they are sometimes rove double, in which case there is a block at the head of the sail, the standing part being seized to the collar of the stay. *Studding-sail* halliards are bent to the studding-sail yard, and reeve through a block at the yard-arm, thence through a block on the mast, and down to deck; the fore clew-jigger is used as the *inner* halliards. *Throat-* and *peak*-halliards are used on gaffs, the former hooked to the jaws, and the latter to the peak. *Gaff-topsail* halliards are rove through a sheave on the mast, and are bent to the yard or head-cringle of the gaff-topsail. *Crow-foot* halliards reeve through a block on the lower stay, and are bent to the crow-foot on the awning. *Signal*-halliards, light lines extending from the deck to the trucks or gaff-ends; used for hoisting signal-flags. *Ensign*-halliards, the line by which the colors are run up to the peak or flag-staff. *Smoke-stack* halliards, Jack's term for the hoisting apparatus of the smoke-stack.

Halo. A luminous ring encircling the sun or moon, whose light passing through the intervening vapor gives rise to the phenomenon. Halos are termed *lunar* or *solar* according as they appear around the moon or sun. The lunar halo is simply a white, luminous circle without color excepting a pale red, which sometimes fringes the interior edge of the circle. Solar halos are prismatically colored. See CORONA, PARHELIA.

Halse, or Halser. Archaic spelling of *hawser*.

Halve-net. A net to prevent fishes from going out with the falling tide.

Halyards. See HALLIARDS.

Hamac. Columbus found that the inhabitants of the Bahama Islands had for beds nets of cotton suspended at each end, which they called *hamacs*, or *hamacas*,—whence *hammock*, a name since adopted universally among seamen. See HAMMOCK.

Hambroline. A superior sort of small stuff used for seizings.

Hamburg, one of the principal cities of Germany, is situated on the right bank of the Elbe, about 70 miles from its mouth. Lat. 53° 33′ 7″ N.; lon. 9° 58′ 23″ E. Its manufactories comprise sugar-refineries, tar, tobacco, and sail-cloth factories, ship-yards, anchor and iron forges, etc. It is the greatest commercial city of the European continent, its trade being chiefly with Great Britain and America, and its many first-class steamers are constantly running to New York, the West Indies, South America, and the Mediterranean. The channel of the Elbe has been improved, so that vessels drawing 18 feet of water can reach the city at high tide. Pop. 264,850.

Hamel. The star *α Arietis*.

Hammer. That appendage of the lock of a fire-arm which, being first drawn back to the position of "cock," is, by the operation of the trigger and internal mechanism of the lock, sprung down upon the cap, or against the firing-pin or percussion-cartridge, with such force as to explode the fulminate and to cause the discharge of the piece.
